One of the most important series of Engravings that has ever yet been undertaken, has been recently completed. In the vastness of its enterprise, and in the enormous outlay which it has required to sustain it, this magnificent work resembles one of those *Galerias Royales* executed under the control, and supported by the resources, of a despotic and princely government, than the unaided speculation of a private citizen.

It was published in Twenty-Four Parts, each of which contained Four Plates, elaborately and admirably engraved by the first artists: among whom Messrs. Miller, Allen, R. Wallis, Willmore, W. R. Smith, Goodall, Horsburg, Radcliffe, Kernot, Jeavons, Varrall, Higham, Fisher, Redaway, Brandard, &c. are eminently conspicuous. Every person possessing the slightest pretensions to a knowledge of the Fine Arts, should, consistently with a correct appreciation of Pictorial Embellishments, assign to these two stately volumes a prominent position in his library, and regard them as one of its most important, most interesting, and most ornamental features.

To declare that TURNER is the Claude of existing artists, is perhaps scarcely a sufficient panegyric, for he has many qualities which his great predecessor wanted. Nor could, probably, the converse of this affirmation, if hazarded, be maintained; for it might be impossible to prove that the ancient painter had one merit in his vocation which his modern rival does not also possess. It may, however, generally be asserted that TURNER is an artist of unrivalled excellence in the present day. Whether he depicts a fertile valley, or a vast expanse of moor wholly devoid of foliage, the most noble ruin of a stately castle surrounded by every scenic accessory, or the most plebeian forge in the dirtiest manufacturing town, with no adjuncts but dingy walls and massive volumes of heavy smoke, he equally elevates and dignifies his subjects. In the representation of shipping and of quays, with a background of ancient houses, he peculiarly excels; and the old cathedral seems to have been at once his birth and dwelling-place, if an inference is to be made from the consummate art and accuracy with which he portrays them. On the sea or the river—the lake or the marsh—amid the forest and the brake—in the dark, or on the sunny plain—in tempest and calm—night and day—the crimson tints of evening, or the silvery light of the moon—TURNER is equally successful in catching the spirit of the scene, and magically conveying all its distinctive features and charms.

But a specific enumeration of all his excellences as an artist would comprise every inanimate object, whether natural or artificial. Without, therefore, further particularity, it may, in conclusion, be boldly asserted, that few works of art have ever presented greater claims to the patronage of a large mass of the community than "The England and Wales" of J. M. W. TURNER.

THE ENTIRE STOCK OF COPIES AND COPPERPLATES OF SELECT VIEWS IN GREECE,

Comprised in Sixty-four Plates, engraved in the best Line Manner, from Drawings by the late H. W. WILLIAMS, Esq., author of "Travels in Italy, Greece," &c. With Classical Illustrations.

The Work was originally published in Twelve Parts, forming Two Volumes, Imperial Octavo; also in Royal Quarto, with India Proofs, and Imperial Quarto, India Proofs before the Letters.

THE REMAINING PROOF-IMPRESSIONS OF THE ILLUSTRATIONS OF THE LITERARY SOUVENIR,

FOR THE YEARS 1829 TO 1834 INCLUSIVE.

Edited by A. A. WATTS, Esq.

COMPRISING

In Imperial Quarto, India Proofs.

100 Sets of the six years, consisting of 68 Plates each;

125 Sets of the last four years, consisting of 48 Plates each;

109 Sets of the last two years, consisting of 30 Plates each;

And in Colombier Quarto, India Proofs before the Letters,

59 Sets of the six years;

7 Sets of the last four years;

16 Sets of the last two years;

Also a quantity of Odd Impressions of both sizes.

These ILLUSTRATIONS are from the pencils of many of the most distinguished Artists of the present day, and the burins of the most eminent Engravers.

* * Catalogues may be had of Mr. SOUTHGATE; to whom Commissions may be forwarded.

REVIEW OF NEW BOOKS.

Woman's Mission. 12mo. pp. 154. London, 1839. Parker.

AMONG our Notices to Correspondents last week, we mentioned this small volume as one eminently entitled to consideration; and the more especially at a period when the very important question of National Education occupies the attention of the legislature, and, indeed, of all ranks of the people. The subject is one as difficult as it is momentous. It is so beset by theories, and prejudices, and passions, and political aims, and conflicting interests, that there is perhaps no man sufficiently clear and highly elevated above the rest to be able to look upon it in all its aspects and bearings, and bestow upon it that calm and masterly comprehension, without which meddling can only be mischievous, and interference fraught with danger. By what scheme can all be taught to think alike, and to think rightly? He would be a profound doctor who could devise this prodigy. Yet there are certain truths that cannot be disputed, and within their limits it is not only wise, but absolutely necessary, in the existing state of society, to go as far as we can in training the minds and moulding the characters of the rising generation. The debate in the House of Commons seems to us to be liable to one objection, namely, that every speaker has taken up the matter at the middle; none have gone to first principles and original sources of human impression. Their argument has been, What should be done with children who have reached those years when schooling begins, and how are we to form proper teachers for them—the educators of the ignorant? But there is an antecedent time, of which we hear nothing, and yet it is a period of life when all the seed is sown which these instructors are called upon to cultivate. If that seed be bad, their labour will be thrown away; if it be good, the fruit will reward their efforts with blessings. It is to this era, to the infant term, that the volume before us is directed; and its great doctrine is to demonstrate that, by elevating and enlightening the female sex alone can children be trained in the way they should go, and become through their after years what it ought to be the sole object of all education to make them—good men and women, forbearing, conscientious, benevolent, just, religious, contented, and happy. We never forget our first lessons; let us, then, take care that they are such as can only be remembered with mutual advantage to ourselves and our fellow-creatures.

Woman's Mission is founded on M. Aimé Martin's excellent work, "Sur l'Education des Mères;" but our countrywoman (for this is evidently the production of a female of high intellectual and moral accomplishments) has adapted it with peculiar talent to the wants and circumstances of English society. She declares for the influence of Woman rather than for her power—for indirect rather than direct operation—and for acting in a subordinate capacity rather than by asserting the authority of principals. "Yet (she says) we are not one iota behind those fiery champions of womanhood, in exalted notions of its dignity and mis-

sion. We are as anxious as they can be that women should be roused to a sense of their own importance; but we affirm that it is not so much social institutions that are wanting to women, but women who are wanting to themselves. We claim for them no less an office than that of instruments (under God) for the regeneration of the world,—restorers of God's image in the human soul. Can any of the warmest advocates of the political rights of woman claim or assert for her a more exalted mission,—a nobler destiny? That she will best accomplish this mission by moving in the sphere which God and nature have appointed, and not by quitting that sphere for another, it is the object of these pages to prove."

"The friends of instruction," she well observes, in another place, "look upon intellectual culture as the grand panacea for all evils; and the enlightened and benevolent exhaust themselves in efforts to extend to the many the advantages once confined to the few. Good results follow, but not the results expected. Intellectual by no means involves moral progress,—this we see in nations: intellectual by no means involves moral superiority,—this we see, alas! in gifted individuals. * * * We are fairly entitled to deduce that, though intellect may give dignity and vigour to moral sentiments where they do exist, it has no tendency to produce them where they do not. Nay, like an unprincipled ally, it is ever ready to aid either party, and to lend energy to bad passions as well as loftiness to good ones. It is a singular corroborating fact, that the grosser passions are never found in coexistence with the higher moral sentiments; such coexistence being not only possible but frequent in the case of intellect. * * * We see how men may be rendered better and happier; in other words, on what principles depend the regeneration of mankind: on the cultivation of the religious and moral portion of their nature, which cultivation no government has yet attempted, over which, in fact, governments and public institutions have little or no control. It is in the cultivation of that divine spirit of unselfish rectitude, which has love for his origin, and the good of others for its aim; a spirit opposed—oh, how opposed!—to the selfish and grovelling utilitarianism which it appears to be the unfortunate tendency of physical improvements to promote, and which intellectual culture at best serves but to neutralise. Principles have their chief source in influences; early influences, above all; and early influences have more power in forming character than institutions or mental cultivation; it is therefore to the arbiters of these that we must look for the regenerating principle. We must seek, then, some fundamental principle, some spirit indefatigable, delighting in its task, and which may pervade the whole of society. Such a principle we find in family affection,—especially in maternal affection. Have we, then, been too bold, in asserting that women may be the prime agents of God in the regeneration of mankind? [Napoleon said one day to Madame Campan, 'The old systems of instruction are worth nothing. What is wanting, in order that the

youth of France be well educated?' Mothers! replied Madame Campan. This reply struck the emperor. 'Here,' said he, 'is a system of education in one word. Be it your care to train up mothers who shall know how to educate their children.' This profound remark is the very subject of our book; it contains, perhaps the secret of a mighty regeneration."

How finely is it elsewhere said—

"Good schoolmasters make good scholars,—good mothers make good men; here is the difference of their missions. It follows, that the education, properly so called, of the child, depends almost entirely on mothers; and if they have been too willing to trust to delegated authority for its accomplishment, it is because they have identified education with instruction—two things essentially different, and which it is essential to separate: for instruction may be interrupted, and pass from hand to hand, but education should be of one piece: whatever interrupts it, hinders it—whoever abandons it after having undertaken it, may see her child lost in the wanderings of error, or, what is more deplorable, in utter indifference to virtue."

It is equally true, that "the importance of early impressions—of home impressions—is proved by the extreme difficulty of eradicating or counteracting them if bad. Conscientious teachers of youth can bear ample testimony to this fact. They have often occasion to lament, with grief and humiliation, the powerlessness of their most devoted endeavours to remove early bad impressions—or to do any thing more than just palliate the effects of unfavourable domestic influences—of an unhealthy domestic atmosphere. It is the mother who, as the source of moral influence, is the former of the moral atmosphere."

"There is another particular in which the character of the mother greatly influences the views and welfare of her sons, which ought to be treated of, for it is not enough impressed upon the maternal heart. It is of the utmost importance to the virtue and happiness of men, that they enter life with exalted notions of female character, and that they be not satisfied with the semblance, without the reality of virtue. Let each mother then engrave upon the heart of her son such an image of feminine virtue and loveliness, as may make it sufficient for him to turn his eyes inward, in order to draw thence a power sufficient to combat evil, and to preserve him from wretchedness."

Having, in these correct and noble sentiments, pointed out the proper sphere of her sex, the author very happily combats the absurd pretensions of the Wolstoncroft school.

"Because it is perceived that women have a dignity and value greater than society or themselves have discovered; because their talents and virtues place them on a footing of equality with men, it is maintained that their present sphere of action is too contracted a one, and that they ought to share in the public functions of the other sex. Equality, mental and physical, is proclaimed! This is matter too ludicrous to be treated any where but in a professed satire: in sober earnest, it may be asked, Upon what grounds so extraordinary a

doctrine is built up? Were women allowed to act out these principles, it would soon appear that one great range of duty had been left unprovided for in the schemes of Providence; such an omission would be without parallel. Two principal points only can here be brought forward, which oppose this plan at the very outset; they are—1st. Placing the two sexes in the position of rivals, instead of coadjutors,—entailing the diminution of female influence. 2d. Leaving the important duties of woman only in the hands of that part of the sex least able to perform them efficiently. The principle of divided labour seems to be a maxim of the Divine government, as regards the creature. It is only by a concentration of powers to one point, that so feeble a being as man can achieve great results. Why should we wish to set aside this salutary law, and disturb the beautiful simplicity of arrangement which has given to man the power, and to woman the influence, to second the plans of almighty goodness? They are formed to be co-operators, not rivals, in this great work; and rivals they would undoubtedly become, if the same career of public ambition, and the same rewards of success, were open to both. Woman, at present, is the regulating power of the great social machine, retaining, through the very exclusion complained of, the power to judge of questions by the abstract rules of right and wrong—a power seldom possessed by those whose spirits are chafed by opposition, and heated by personal contest. The second resulting evil is a grave one, though in treating of it, also, it is difficult to steer clear of ludicrous associations. The political career being open to women, it is natural to suppose that all the most gifted of the sex would press forward to confer upon their country the benefit of their services, and to reap for themselves the distinction which such services would obtain; the duties hitherto considered peculiar to the sex would sink to a still lower position in public estimation than they now hold, and would be abandoned to those least able conscientiously to fulfil them. The combination of legislative and maternal duties would indeed be a difficult task, and, of course, the least ostentatious would be sacrificed. Yet women have a mission! ay, even a political mission, of immense importance! which they will best fulfil by moving in the sphere assigned them by Providence; not comet-like, wandering in irregular orbits, dazzling indeed by their brilliancy, but terrifying by their eccentric movements and doubtful utility.

“What, then, (she continues, in discussing the education of women,) is the true object of female education? The best answer to this question is, a statement of future duties; for it must never be forgotten, that if education be not a training for future duties, it is nothing. The ordinary lot of woman is to marry. Has any thing in these educations prepared her to make a wise choice in marriage? To be a mother! Have the duties of maternity,—the nature of moral influence,—been pointed out to her? Has she ever been enlightened as to the consequent unspeakable importance of personal character as the source of influence? In a word, have any means, direct or indirect, prepared her for her duties? No! but she is a linguist, a pianist, graceful, admired. What is that to the purpose? The grand evil of such an education is the mistaking means for ends; a common error, and the source of half the moral confusion existing in the world. It is the substitution of the part for a whole. The time when young women enter upon life is the one point

to which all plans of education tend, and at which they all terminate: and to prepare them for that point is the object of their training. Is it not cruel to lay up for them a store of future wretchedness, by an education which has no period in view but one; a very short one, and the most unimportant and irresponsible of the whole of life?”

Upon the critical subject of love, the observations are original and striking:—

“Meanwhile these exaggerated precautions in the education of one sex have been met by equally fatal negligence in the education of the other; and while to girls have been denied the very thoughts of love,—even in its noblest and purest form,—the most effeminate and corrupt productions of the heathen writers have been unhesitatingly laid open to boys; so that the two sexes, on whose respective notions of this passion depends the ennobling or the degrading of their race, meet on these terms:—the men know nothing of love but what they have imbibed from an impure and polluted source; the women, nothing at all, or nothing but what they have clandestinely gathered from sources almost equally corrupt. The deterioration of any feeling must follow from such injudicious training, more especially a feeling so susceptible as love of assuming such differing aspects. Let no sober-minded person be startled at the deduction hence drawn, that it is foolish to banish all thoughts of love from the minds of the young; since it is certain that girls will think, though they may not read or speak, of love, and that no early care can preserve them from being exposed, at a later period, to its temptations, might it not be well to use here the directing, not the repressing power? Since women will love, might it not be as well to teach them to love wisely? Where is the wisdom of letting the combatant go unarmed into the field, in order to spare him the prospect of a combat? Are not women made to love, and to be loved; and does not their future destiny too often depend upon this passion? And yet the conventional prejudice which banishes its name subsists still.”

Personal influence, maternal duties, and religion, are severally treated with the same judgment and force as those points whence we have gleaned our extracts; and we have to regret that our limits forbid further illustration of a volume altogether so valuable in its inculcations. Its aim is of the highest consequence; and though the full fruition may be denied for centuries to come, there is nothing of visionary enthusiasm to deter us from entertaining the views, and entering into the hopes, of the writer. If all cannot be attained, some portion may.

“Do the duty that lies nearest thee,” says the German sage. Oh! that we could all make this the motto of our heart and of our life, and do the duty that lies nearest us with all our heart, and all our mind, and all our soul, and all our strength. And here I would address myself to the educators of female youth, beseeching them to consider the deep importance of their occupation,—entreating them to remember that to them is intrusted the training of beings, whose mission on earth is not only to shine, to please, to adorn, but to influence, and by influencing to regenerate;—that the chief object of their education is not so much to fit them to adorn society, as to vivify and enlighten a home. What a paradise even this world might become, if one half the amount of effort expended in vain attempts to excite the admiration of strangers, were reserved to vary the amusements and adorn the sacred precincts of home! Here is an inexhaustible field of effort, an inexhaustible source of happiness; and here

women are the undoubted agents, and they complain of having no scope for exertion! The happiness without which wealth, honours, nay, intellectual pleasures, are but gilded toys, it is theirs to produce and foster; and they have no mission! The only bliss of Paradise that has survived the fall is deposited in their keeping, and they have no importance; alas, for the mental vision of those who see not the things that belong unto their own peace and the peace of others!”

To this we can add nothing, but that we earnestly recommend this work to every woman in Great Britain.

Buenos Ayres, and the Provinces of the Rio de la Plata; their Present State, Trade, and Debt, &c. By Sir Woodbine Parish, K.C.H. &c. 8vo. pp. 415. London, 1839. Murray.

FROM his long official residence in Buenos Ayres, and the breaking up of the Spanish dominion in those parts of South America, by which means access was obtained to many secret documents which the jealousy of the authorities had locked up from public inspection, Sir Woodbine Parish has been enabled to supply a considerable mass of information respecting places hitherto but little known. The country is now, we trust, continuing to improve, and lay the foundations of future concord and prosperity; and it is, therefore, a good period at which to take a retrospect at the past, and observe the course of events during the last sixty years to the present day. A very excellent map is not one of the least valuable contributions for which we are indebted to the author; and this, together with his statistical intelligence, and view of the existing state of the commerce and finance of these provinces, will recommend his book to all who desire to be instructed in these subjects.

For ourselves and our readers we shall refer to more miscellaneous portions of the work, and first direct attention to the following matter relating to the natural history of the Plata:—

“I regret (observes Sir Woodbine) that I lost, during my residence at Buenos Ayres, the opportunity of making what too late I learnt would have been very acceptable additions to our zoological collections; but I never imagined that our public museums were so entirely destitute, as I found them upon my return, of specimens of the commonest objects of natural history, from a country with which we had been so many years in, I may say, almost daily intercourse. Mr. Darwin, and the officers of his majesty's ship *Beagle*, have since done much to supply these deficiencies; but we still want, I believe, specimens of by far the greater part of the birds and beasts of which Azara gave us the description nearly forty years ago. The collections of some of the museums on the continent are, I believe, much more complete; especially those of Paris, to judge from the accounts of the acquisitions made by M. Alcide d'Orbigny, the fruits of many years spent in those countries, to which he was sent in 1826, expressly, I believe, to collect information and specimens for the Museum of Natural History. Instigated first by Dr. Buckland, I made those inquiries for fossil remains, the results of which I flatter myself have been of no common interest both to the geologist and comparative anatomist. The examination of the monstrous bones which I sent to this country, by the learned individuals who have taken the pains to describe them, assists us to unravel the fabulous traditions handed down by the aborigines respecting a race of Titans, whilst it

proves indisputably that the vast alluvial plains in that part of the world, at some former period, the farther history of which has not been revealed to us, were inhabited by herbivorous animals of most extraordinary dimensions, and of forms greatly differing from those of the genera now in existence. To the account of the megatherium, and other extinct animals, I am now enabled, by a delay which has unavoidably occurred in the publication of this volume, to insert the representation of another extinct monster, the glyptodon, which has been very recently discovered at no great distance from the city of Buenos Ayres, apparently in a very perfect state, and which I trust are long will be in England. Mr. Owen, of the College of Surgeons, has been good enough to draw up for me the description of it." [Which we subjoin].—

"*Note on the Glyptodon.*—Whilst the last pages of this volume were in the press, I received accounts from South America fully bearing out my own opinions, not only as to the abundance of fossil remains in the pampas, but that other monsters no less extraordinary than the megatherium once inhabited them. In the last year, gigantic bones have been met with not far from Monte Video; whilst in the pampas of Buenos Ayres two more skeletons of the megatherium have been found; one of them near Luxan (where that at Madrid was dug up), on the property of Señor Muniz, a medical gentleman, who was engaged in exhuming it with great care, and every prospect of completing the skeleton. A still more interesting discovery is that of the apparently complete remains of another monstrous fossil animal, entirely new to us, of which I annex a sketch reduced by Mr. Olfert, from an original drawing made of it *in situ*, which has been sent to me by Mr. Griffiths, H. M. consul at Buenos Ayres. I trust it will not be long ere these remarkable remains are in this country, where I doubt not they will afford a rich treat to the scientific inquirer. In the meantime, the drawing in question, accompanied by one of the teeth, has been sufficient to enable Mr. Owen to draw up the following notice, which I am happy to be able at once to publish, as a foretaste of what is to come. The monster it refers to was found in the bank of a rivulet near the Rio Matanza, in the Partido of Canuelas, about twenty miles to the south of the city of Buenos Ayres, in a low marshy place, about five feet below the surface. It appears by the report sent home with the original drawing, that the entire length of the beast, from the snout to the end of the tail, measures eight and a half English feet; the width of the body, three feet four inches; and its height, from the point A to B, three feet six inches. The vertebral column, from the neck to the sacrum, is altogether; the ilia uniting with the vertebral column and sacrum in one single and immovable piece. It will be at once manifest that the sketch conveys the idea of a gigantic quadruped of the megatherium or armadillo family, having the internal skeleton and the external dermal bony case in their natural relative positions. The head is covered with a coronal plate, of a form which closely corresponds with that which defends the corresponding part in existing armadillos: a long descending process is indicated as being continued from the zygoma, with a slight curve forwards; this structure is interesting, as showing that the part in which the megatherium most strikingly resembles the sloth is participated by another extinct species, which indubitably possesses the characteristic armour

of the armadillo tribe. The lower jaw, in the peculiar descending curve of the ramus below and before the angle, also closely resembles that of the megatherium. The armour of the trunk would seem to be more capacious, and to have extended lower down, than in existing armadillos: its structure is described to consist of polygonal plates, similar to the shelly coverings of all that family; which the animal appears also to have resembled in the number of its teeth. Beneath the caudal plate six hamapophyses or chevron-bones are delineated, apparently of disproportionate magnitude; but the indication is interesting, as exhibiting another well-marked feature of the megatherian organisation. * * * The tooth is slightly curved, with a smooth and polished exterior; its texture resembles that of the tooth of the armadillo, consisting of a central body of ivory with an external coating of cementum, but the latter is relatively thicker than in the armadillos. The ivory, from its superior density, projects above the grinding surface in the form represented in the drawing (fig. 3). The form and structure of the tooth indicates its adaptation to masticate vegetable substances of the softer kind; and the animal must have been provided with claws suitable to the digging up of esculent roots, reeds, &c. The tooth is more complicated in its external form than those of any recent or extinct edentate species hitherto discovered, and seems to indicate a transition from the bruta, or edentata, to the toxodon discovered by Mr. Darwin in the same part of the world. From the regularly fluted or sculptured form of the tooth, I would propose to name the genus typified by this animal 'glyptodon' (γλυφω, *sculpo*; δους, *dens*)."

A picture of Buenos Ayres suffering from the north wind offers us a suitable extract:—

"Europeans, though often sensible of its influence, are not in general so liable to be affected by this abominable wind as the natives, amongst whom the women appear to be the greatest sufferers, especially from the headache it occasions. Numbers of them may be seen at times in the streets, walking about with large split-beans stuck upon their temples—a sure sign which way the wind blows. The bean, which is applied raw, appears to act as a slight blister, and to counteract the relaxation caused by the state of the atmosphere. But it is not the human constitution alone that is affected; the discomforts of the day are generally increased by the derangement of most of the household preparations:—The meat turns putrid, the milk curdles, and even the bread which is baked whilst it lasts is frequently bad. Every one complains, and the only answer returned is—'Senor, es el viento norte.' All these miseries, however, are not without their remedy; when the sufferings of the natives are at their climax, the mercury will give the sure indication of a coming pampero, as the south-wester is called; on a sudden, a rustling breeze breaks through the stillness of the stagnant atmosphere, and in a few seconds sweeps away the incubus and all else before it; originating in the snows of the Andes, the blast rushes with unbroken violence over the intermediate pampas, and, ere it reaches Buenos Ayres, becomes often a hurricane. A very different state of things then takes place, and, from the suddenness of such changes, the most ludicrous, though often serious, accidents occur, particularly in the river; whither, of an evening especially, a great part of the population will resort to cool themselves during the hot weather. There may be seen hundreds and hun-

dreds of men, women, and children, sitting together up to their necks in the water, just like so many frogs in a marsh: if a pampero breaks, as it often does, unexpectedly upon such an assembly, the scramble and confusion which ensues is better imagined than told; fortunate are those who may have taken an attendant to watch their clothes, for otherwise, long ere they can get out of the river, every article of dress is flying before the gale. Not unfrequently the pampero is accompanied by clouds of dust from the parched pampas, so dense as to produce total darkness, in which I have known instances of bathers in the river being drowned ere they could find their way to the shore. I recollect on one of these occasions a gang of twenty convicts, who were working at the time in irons upon the beach, making their escape in the dark, not one of whom, I believe, was retaken. It is difficult to convey any idea of the strange effects of these dust-storms: day is changed to night, and nothing can exceed the temporary darkness produced by them, which I have known to last for a quarter of an hour in the middle of the day; very frequently they are laid by a heavy fall of rain, which, mingling with the clouds of dust as it pours down, forms literally a shower of mud. The sort of dirty pickle in which people appear after being caught in such a storm is indescribable. Sometimes the consequences are more serious, and the pampero is accompanied by the most terrific thunder and lightning; such, I believe, as is to be witnessed in no other part of the world, unless it be the Straits of Sunda. Nothing can be more appalling. In Azara may be read an account of nineteen persons killed by the lightning which fell in the city during one of these storms. But the atmosphere is effectually cleared; man breathes once more, and all nature seems to revive under the exhilarating freshness of the gale:—the natives, good-humoured and thoughtless, laugh over the less serious consequences, and soon forget the worst; happy in the belief that, at any rate, they are free from the epidemical disorders of other regions. Still such variations from the ordinary courses of nature cannot but be productive of strange consequences; and, though the transient effects of an overcharged atmosphere may be quickly dispelled by a pampero, and the people be really free from the epidemics of other countries, there is every reason to believe that, in this particular climate, the human system is in a high degree susceptible of affections which elsewhere would not be deemed worth a moment's consideration. Besides those I have already spoken of as arising from the north wind, old wounds are found to burst out afresh, new ones are very difficult to heal; an apparently trivial sprain will induce a weakness of the part requiring years, perhaps, to recover from, as I know from my own experience; and lock-jaw from the most trifling accidents is so common as to constitute the cause of a very great portion of the deaths from hurts in the public hospitals."

In noticing the various tribes that occupy the land, Sir Woodbine gives us the following account of the Pehuenches:—

"The women as well as the men paint themselves: their chief ornaments consist of as many gold or silver rings as they can collect upon the fingers, and large ear-rings, resembling both in size and shape a common English brass padlock. Their habitations consist of tents made of hides sewn together, which are easily set up and moved from place to place. Their principal food is the flesh of mares and colts, which they prefer to any other; if they

add any thing in the shape of cakes or bread, it is made from maize and corn obtained from the Spaniards in exchange for salt and cattle, and blankets, of the manufacture of their women, for it is rarely they remain long enough in the same place to sow and reap themselves. Their caciques, or ulmenes, as they call them, are generally chosen either for their superior valour or wisdom in speech—occasionally, but not always, the honour descends from father to son: they have but little authority in the tribe, except in time of war, when all submit implicitly to their direction. They are not, however, entirely without laws and punishments for certain crimes, such as murder, adultery, theft, and witchcraft. Thus, he who kills another is condemned to be put to death by the relations of the deceased, or to pay them a suitable compensation. The woman taken in adultery is also punishable with death by her husband, unless her relations can otherwise satisfy him. The thief is obliged to pay for what he is convicted of stealing; and, if he has not the means, his relations must pay for him. As to those accused of witchcraft, they are burnt alive with very little ceremony; and such executions are of frequent occurrence, inasmuch as a man rarely dies a natural death, but it is ascribed to the machinations of some one in communication with the evil spirit. The relatives of the deceased, in their lamentations, generally denounce some personal enemy as having brought about his end, and little more is necessary to ensure his condemnation by the whole tribe: sometimes in his agony the unhappy victim names others as his accomplices, and, if the dead man be of any importance amongst them, they, too, are often sacrificed to his manes in the same barbarous manner. As to their religion, they believe in a God, the creator and ruler of all things, though they have no form of worship: they also believe in the influence of an evil spirit, to whom they attribute any ill that befalls them. They consider that God has sent them into the world to do right or wrong as they please; that, when the body perishes, the soul becomes immortal, and flies to a place beyond the seas, where there is an abundance of all things, and where husbands and wives meet, and live happily together again. On the occasion of their funerals, that they may want for nothing in the other world to which they have been used in this, their clothing, and accoutrements, and arms, are buried with them; sometimes a stock of provisions is added; and when a cacique is buried, his horses are also slain and stuffed with straw, and set upright over his grave. The interment is conducted with more or less ceremony, according to the rank of the deceased:—if he be a man of weight amongst them, not only his relations, but all the principal persons of the tribe, assemble and hold a great drinking-bout over his grave, at which the more drink, the more honour. They have great faith in dreams, especially in those of their ancestors and caciques, to whom they believe they are sent as revelations for the guidance of the tribe on important occasions; and they seldom undertake any affair, either of personal or general importance, without much consultation with their diviners and old women as to the omens which may have been observed. Marriage is an expensive ceremony to the bridegroom, who is obliged to make rich presents, sometimes all he is worth, to the parents of his love, before he obtains their consent. Thus daughters are a source of sure wealth to their parents, whilst those who have only sons are often ruined by the assistance which is re-

quired from them on these occasions. Such as can afford it take more wives than one, but the first has always precedence in the household arrangements, and so on in succession. When a child is born, it is taken with the mother to the nearest stream; in which after both are bathed, the mother returns to her household duties, and takes part in preparing for the feast that follows. In almost all these habits, the Pehuenches appear to follow the Araucanians, of whose manners and customs Molina has given a full account in his 'History of Chile.'"

Of another tribe, the Puelches, we are told:—

"Nothing could exceed the laziness and brutality, in general, of the men, who, looking upon the women as inferior beings, treated them as the most abject slaves. Not only were they obliged to attend to all the ordinary duties of a family, but upon them, also, devolved the care of their husbands' horses, and even the tending of the sheep and cattle. Polygamy was permitted, and, according to his means, it appeared that a man kept more or less wives; which, so far from causing jealousy, seemed generally a source of satisfaction to the ladies themselves, inasmuch as it led to the lightening by subdivision of their domestic labours. Unless engaged in some predatory excursion, or in hunting deer and guanacoos, and other smaller animals, for their skins, the men seemed to pass their whole time in sleeping, drinking, and gambling, the habitual vices of all the tribes:—they are passionately fond of cards, which they obtain from the Spaniards, and will play for ever at dice, which they make themselves ingeniously enough; and, like gamblers in other parts of the world, will stake their all upon a throw, reckless of reducing their families to utter destitution. In each toldo, or tent, which is made of hides stretched upon canes, and easily removable from one place to another, five or six families, barely separated from each other, perhaps twenty or thirty persons in all, were closely huddled together in the most horrible state of filth imaginable: indeed, in many respects, they were but little removed in their habits from the brute creation. If fuel was scarce, as was often the case in the pampas, they cared not to cook their meat, but ate it raw, and always drank the warm blood of every animal they killed:—like beasts of prey, there was no part, even to the contents of the stomach and intestines, which they will not greedily devour. They were superstitious in the extreme, and the credulous dupes and tools of a few artful men, who are to be found in every tribe, and in reality direct all its concerns by pretending to foretell the future, and to divine the cause of every evil. They are called *machis*, or wizards, and there is no tribe without them, and which does not implicitly submit to their decisions and advice. Their word is law, and the cacique even, equally with the rest, submits to it."

The descriptions of Paraguay, Catamarca, Tucuman, &c. &c. are brief; but Steam is approaching their rivers, and in a few years the people and the country will be changed by this Magician. Meanwhile, we recommend the present account of them to the reader.

The Loving Ballad of Lord Bateman. Illustrated by George Cruikshank. Square 16mo. Pp. 40. London. Tilt. *Constantinople, Mustapha Syried!*

A jeu d'esprit of the illustrious Cruikshank: his own favourite ballad, which he chants with such inimitable humour, illustrated in a manner

not less humorous by his pencil. Lord Bateman appears on the frontispiece, a most gallant knight of the period to which he belonged, though we cannot pretend to fix what that period was. Then comes the author and artist's warning to the public, in the shape of preface. We know not how far to believe him; but it is only justice to lay so important a document before the world. It is *verbatim et literatim* as follows:—

"In some collection of old English Ballads, there is an ancient ditty which I am told bears some remote and distant resemblance to the following Epic Poem. I beg to quote the emphatic language of my estimable friend (if he will allow me to call him so), the Black Bear in Piccadilly, and to assure all to whom these presents may come, that 'I am the original.' This affecting legend is given in the following pages, precisely as I have frequently heard it sung on Saturday nights, outside a house of general refreshment (familiarily termed a wine-vaults) at Battle-bridge. The singer is a young gentleman who can scarcely have numbered nineteen summers, and who, before his last visit to the treadmill, where he was erroneously incarcerated for six months as a vagrant (being unfortunately mistaken for another gentleman), had a very melodious and plaintive tone of voice, which, though it is now somewhat impaired by gruel and such a getting up stairs for so long a period, I hope shortly to find restored. I have taken down the words from his own mouth at different periods, and have been careful to preserve his pronunciation, together with the air to which he does so much justice. Of his execution of it, however, and the intense melancholy which he communicates to such passages of the song as are most susceptible of such an expression, I am unfortunately unable to convey to the reader an adequate idea, though I may hint that the effect seems to me to be in part produced by the long and mournful drawl on the last two or three words of each verse. I had intended to have dedicated my imperfect illustrations of this beautiful Romance to the young gentleman in question. As I cannot find, however, that he is known among his friends by any other name than 'The Tripe-skewer,' which I cannot but consider as a *soubriquet*, or nick-name; and as I feel that it would be neither respectful nor proper to address him publicly by that title, I have been compelled to forego the pleasure. If this should meet his eye, will he pardon my humble attempt to embellish with the pencil the sweet ideas to which he gives such feeling utterance? And will he believe me to remain his devoted admirer

GEORGE CRUIKSHANK!

"P.S.—The above is not my writing, nor the notes either, nor am I on familiar terms (but quite the contrary) with the Black Bear. Nevertheless I admit the accuracy of the statement relative to the public singer whose name is unknown, and concur generally in the sentiments above expressed relative to him."

We lament that our types can give no idea of the music; we can only say, that it is a pathetic and beautiful tune—a tune almost worthy of the poetry.

"Lord Bateman was a noble lord,
A noble Lord of high degree;
He ship'd his-self all aboard of a ship,
Some foreign countree for to see."

His suffering in captivity, his release by a Turkish maiden, their vows of love, and subsequent adventures for seven long years, are all narrated with truth and tenderness: and the illustrations—the illustrations are *con amore* by George Cruikshank! It is a laughing job to

look at them: so much so that we have had terrible trouble to do our duty and review the work.

The History of the Navy of the United States of America. By J. F. Cooper, Esq., &c. &c. 2 vols. 8vo. London, 1839. Bentley.

THE details in this work are more likely to interest readers in the United States than those of England, though the general view which is given of the rise and progress of the American navy belongs to European, or rather to universal, history. In his introduction, Mr. Cooper alleges that the naval force of his country had, in comparison with its military powers, been too long neglected; that the building of large ships of war is necessary for the protection of her coasts; and that a new and enlarged system of officering vessels ought to be adopted. These are matters into which we care little to enter.

The author then sets out with a notice of the early intercourse between England and the American settlements, from the beginning of the seventeenth century:—

“The first decked vessel (we are told) built within the United States, of which we have any account, was constructed by Schipper Adrian Block, on the banks of the Hudson, and probably within the present limits of New York, during the summer of 1614. This vessel De laet terms a ‘yacht,’ and describes as having been of the dimensions of thirty-eight feet keel, forty-four and a half feet on deck, and eleven feet beam. In this ‘yacht,’ Block passed through Hell Gate, into the Sound, and steering eastward, he discovered a small island, which he named after himself; going as far as Cape Cod, by the way of the Vineyard passage. According to the same authority, the Dutch at New Amsterdam, who had constructed a fort, and reinforced their colony, soon after built many more small vessels, sloops and peraguas, opening a trade with the savages, by means of the numerous bays, sounds, and rivers of their territory. It was also in 1614 that the celebrated Captain John Smith arrived from England, and sailed on a coasting voyage, with the double purpose of trade and discovery. He went himself in a boat, having a crew of only eight men; and the profits, as well as the discoveries, abundantly rewarded the risks. It may serve to give the reader a more accurate idea of the condition of trade in this part of the world, if we state that in 1615 the English alone had one hundred and seventy vessels engaged in the Newfoundland fisheries, while the French, Portuguese, and Spaniards, had altogether about three hundred. Many attempts were made about this time to discover a north-west passage to China; the well-known expedition in which Baffin was employed occurring in 1616.

“Within twenty years after the settlement of Plymouth, ship-building and navigation began to occupy much of the attention of New England; and as every vessel of any size carried many light guns, the navigation of the period had most of the characteristics of an armed trade. In addition to the ships and barks that crossed the ocean, many decked boats, or small sloops, were used on the coast, especially by those who dealt with the Indians for skins. The first engagement that probably ever occurred between inhabitants of the American colonies and enemies afloat, was a conflict between John Gallop, who was engaged in a trade of this nature, in a sloop of twenty tons, and some Narragansett Indians, who had seized upon a small vessel belonging to a person of the

name of Oldham, known to have been similarly occupied. As this, in a certain sense, may be deemed the earliest sea-fight of the nation, we consider it worthy to be related. Some time in May 1636, Gallop, in his little sloop, manned by two men and two boys, himself included, was standing along the Sound, near Plum Island, when he was compelled to bear up by stress of weather, for a refuge, to leeward, among the islands that form a chain between Long Island and Connecticut. On nearing the land, he discovered a vessel very similar to his own, in size and equipments, which was immediately recognised as the pinnace of Mr. Oldham, who had sailed with a crew of two white boys and two Narragansett Indians. Gallop hailed on nearing the other craft, but got no answer; and, on running still nearer, no less than fourteen Indians were discovered lying on her deck. A canoe, conveying goods, and manned by Indians, had also just started for the shore. Gallop now began to suspect that Oldham had been overpowered by the savages—a suspicion that was confirmed by the Indians slipping their cable, and running off before the wind, or in the direction of Narragansett Bay. Satisfied that a robbery had been committed, Gallop made sail in chase, and running alongside of the pinnace, in a spirited manner, he fired a volley of duck-shot at the savages. The latter had swords, spears, and some fire-arms, and they attempted a resistance, but Gallop soon drove them below to a man. Afraid to board in the face of such odds, Gallop now had recourse to a novel expedient to dislodge his enemies. As the pinnace was drifting with no one to manage her, she soon fell to leeward, while the sloop hauled by the wind. As soon as the two vessels were far enough asunder, Gallop put his helm up, and ran directly down on the weather quarter of the pinnace, striking her with so much violence as to come near forcing her over on her side. The shock so much alarmed the Indians, who were on an element and in a craft they did not understand, that six of them rushed frantically on deck, and leaped into the sea, where they were all drowned. The sloop again hauled off, when Gallop lashed an anchor to her bows in such a manner, that by running down on the pinnace a second time, he forced the flukes through the sides of the latter, which are represented as having been made of boards. The two vessels were now fast to each other, and the crew of the sloop began to fire through the sides of the pinnace into her hold. Finding it impossible, however, to drive his enemies up, Gallop loosened his fasts, and hauled up to windward a third time, when four or five more of the Indians jumped overboard and shared the fate of those who had preceded them. One Indian now appeared on deck and offered to submit. Gallop ran alongside, and received this man in the sloop, when he was bound hands and feet, and put into the hold. Another soon followed this example, and he was also received on board the sloop and bound; but, fearful that if two of his wily foes were permitted to commune together, they would liberate themselves, the second prisoner was thrown into the sea. But two Indians now remained in the pinnace. They had got into a small apartment below, and, being armed, they shewed a disposition to defend themselves, when Gallop removed all the goods that remained into his own sloop, stripped the pinnace of her sails, took her in tow, and hauled up for the islands again. But the wind increasing, the pinnace was cut adrift, and she disappeared in the direction of Narragansett Bay, where it is pro-

bable she was stranded in the course of a few hours. On board the pinnace, Gallop found the body of Mr. Oldham. The head had been cleft, the hands and legs were much mangled, and the flesh was still warm. The corpse was thrown into the sea. Thus terminated this extraordinary conflict, in which Gallop appears to have shewn as much conduct as courage, and which in itself illustrates the vast superiority that professional skill gives on an element that requires practice to be rendered successfully available. As it was of the last importance to create a respect for the English name, that might protect small parties while trading with the savages, the report of the conqueror on this occasion induced the government of Massachusetts to send an expedition against the offenders, under Mr. Endecott, one of the assistants, which did the Indians much damage in the destruction of their dwellings and crops, though the savages took to flight. This expedition, however, was followed up by others that met with greater success.”

Such were the earliest struggles of America. Bucaniering followed, and continued for many years; the accounts of which unfold many strange adventures and horrid cruelties; but Mr. Cooper passes them over, and comes within fifty pages of his first volume to Bunker's Hill, Washington, and the revolution in the Colonies. Paul Jones, of course, flourishes at this period; and Mr. Cooper concludes, “It remains only to say, that the navy of the revolution, like its army, was disbanded at the termination of the struggle, literally leaving nothing behind it but the recollections of its services and sufferings.”

The war with the Barbary States led to an advance, and great improvement in the condition of the American navy; and we have all the particulars of the actions both on the ocean and in the lakes, between England and America during the late war. We have dipped into these, and, without comparing Mr. Cooper's statements with those of James and others, as regards the relative forces of the combatants, we may say that he appears to be tolerably fair, and unworried by national prejudices in these records. We took, for example, the affair of the Shannon and Chesapeake, and found little in the description at variance with preceding and English versions of that brilliant engagement. But the spirit of the writer may be best ascertained by quoting his final remarks:—

“Thus terminated the war of 1812, so far as it was connected with the American marine. The navy came out of this struggle with a vast increase of reputation. The brilliant style in which the ships had been carried into action, and the steadiness and rapidity with which they had been handled, and the fatal accuracy of their fire, on nearly every occasion, produced a new era in naval warfare. Most of the frigate actions had been as soon decided as circumstances would at all allow, and in no instance was it found necessary to keep up the fire of a sloop of war an hour, when singly engaged. Most of the combats of the latter, indeed, were decided in half that time. The execution done in these short conflicts was often equal to that made by the largest vessels of Europe in general actions, and in some of them the slain and wounded comprised a very large proportion of the crews. It is not easy to say in which nation this unlooked-for result created the most surprise—America or England. In the first it produced a confidence in itself that had been greatly wanted, but which, in the end, perhaps, degenerated to a feeling of

self-esteem and security that were not without danger, or entirely without exaggeration. The last was induced to alter its mode of rating, adopting one by no means as free from the imputation of a want of consistency as the one it abandoned, and it altogether changed its estimate of the force of single ships, as well as of the armaments of frigates. The ablest and bravest captains of the English fleet were ready to admit that a new power was about to appear on the ocean, and that it was not improbable the battle for the mastery of the seas would have to be fought over again. In short, while some of its ignorant, presuming, and boastful were disposed to find excuses for the unexpected nautical reverses which Great Britain had met with in this short war, the sagacious and reflecting saw in them matter for serious apprehension and alarm. They knew that the former triumphs of their admirals had not so much grown out of an unusual ability to manœuvre fleets, as in the national aptitude to manage single ships, and they saw the proofs of the same aptitude, in the conduct of the Americans during this struggle, improved on by a skill in gunnery that had never before been so uniformly manifested in naval warfare. In a word, it may be questioned if all the great victories of the last European wars caused more exultation among the uninstructed of that nation, than the defeats of this gave rise to misgivings and apprehensions among those who were able to appreciate causes, and to anticipate consequences in matters so purely professional as the construction, powers, and handling of ships. Many false modes of accounting for the novel character that had been given to naval battles was resorted to, and among other reasons it was affirmed that the American vessels of war sailed with crews of picked seamen. That a nation which practised impressment should imagine that another in which enlistments were voluntary could possess an advantage of this nature, infers a strong disposition to listen to any means but the right one to account for an unpleasant truth. It is not known that a single vessel left the country, the case of the Constitution on her two last voyages excepted, with a crew that could be deemed extraordinary in this respect. No American man-of-war ever sailed with a complement composed of nothing but able seamen; and some of the hardest fought battles that occurred during this war, were fought by ships' companies that were materially worse than common. The people which manned the vessels on Lake Champlain, in particular, were of a quality much inferior to those usually found in ships of war. Neither were the officers, in general, old or very experienced. The navy itself dated but fourteen years back, when the war commenced; and some of the commanders began their professional career several years after the first appointments had been made. Perhaps one half of the lieutenants in the service at the peace of 1815 had first gone on board ship within six years from the declaration of the war, and very many of them within three or four. So far from the midshipmen having been masters and mates of merchantmen, as was reported at the time, they were generally youths that first went from the ease and comforts of the paternal home, when they appeared on the quarterdeck of a man-of-war. That the tone and discipline of the service were high is true; but it must be ascribed to moral, and not to physical causes; to that aptitude in the American character for the sea, which has been so constantly manifested from the day the first pin-

nace sailed along the coast on the trading voyages of the seventeenth century, down to the present moment."

We have only to add, that Mr. Cooper omits altogether the most important point in all these estimates and considerations, namely, the number of English sailors who manned the American ships,—desperate men, who fought with halts about their necks, and preferred death in battle to surrender and execution as deserters from the flag of their country. On this important subject the author offers no comment; and we need not say that, without giving it the weight it demands, the conclusions drawn from other premises must be necessarily imperfect and erroneous.

Mrs. Hemans's Memoir and Poems, Vol. I.
(Concluded from No. 1167.)

THE memoir of the life, subsequent to that period of which we treated in our first paper, is very much confined to literary history; and we do not mean to trace the career of Mrs. Hemans through the catalogue of her well-known publications. The following passage is scarcely of this kind, and we give it as highly characteristic:—

"In the autumn of 1824, she began the poem which, in point of finish and consecutiveness, if not in popularity, may be considered her principal work, and which she herself inclined to look upon as her best. 'I am at present,' she wrote to one always interested in her literary occupations, 'engaged upon a poem of some length, the idea of which was suggested to me by some passages in your friend Mr. Blanco White's delightful writings. It relates to the sufferings of a Spanish Protestant, in the time of Philip the Second, and is supposed to be narrated by the sufferer himself, who escapes to America. I am very much interested in my subject, and hope to complete the poem in the course of the winter.' The progress of this work was watched with great interest in her domestic circle, and its touching descriptions would often extract a tribute of tears from the fireside auditors. When completed, a family consultation was held as to its name. Various titles were proposed and rejected, till that of 'The Forest Sanctuary' was suggested by her brother, and finally decided upon. Though finished early in 1825, the poem was not published till the following year, when it was brought out in conjunction with 'The Lays of Many Lands,' and a collection of miscellaneous pieces, most of which had previously appeared in 'The New Monthly Magazine,' or in some of the various Annuals, from whose editors Mrs. Hemans was now receiving continual overtures. The number and urgency of these applications was already beginning to be half tormenting, half amusing, though nothing in comparison with the 'Vallombrosa'-like showers of these 'autumnal leaves' which used to come pouring down upon her in after-years, when the Annual fever had reached its height. It was interesting to observe the manner in which any new idea, accidentally suggested in the course of her reading, would take hold of her imagination, awakening, as with an electric touch, a whole train of associations and developments. Most truly, in her case, was exemplified Mr. Wordsworth's observation respecting poetic sensibility, in which he says, that 'the more exquisite it is, the wider will be the range of a poet's perceptions, and the more will he be inclined to observe objects, both as they exist in themselves, and as reacted upon by his own mind.' By her, objects were never seen simply 'as they exist in themselves.' Every thing

brought its own appeals to thought and memory; and every sight and sound in nature awakened some distinct echo in her heart. The very rustling of the trees spoke to her in tones full of meaning. It was one of her favourite fancies that each tree had its peculiar language, suited to its character for majesty, solemnity, or grace, and that she could distinguish with closed eyes the measured tones of the oak or elm, the funeral sighs of the cypress, or the sensitive murmurs of the willow or poplar! From some particular train of association, she took great delight in seeing the waving boughs of trees through a church-window. All legends and superstitions regarding trees and flowers were peculiarly dear to her. When alluding to these, and similar fables, she would often quote the well-known lines from Schiller—

'Wage du zu Irren und zu träumen,
Hohen ihm liegt oft in kind'schem Spiel.'*

"One of her favourites, amongst the many traditions of this nature, was the Welsh legend regarding the trembling of the aspen; which, with a kindred superstition relating to the spotted arum, will be found mentioned in the 'Woodwalk and Hymn,' in 'Scenes and Hymns of Life.' And in the two sonnets entitled 'Thoughts connected with Trees,' which form part of the 'Records of the Spring of 1824,' she has revealed to us yet more distinctly how much 'deep meaning' their 'kindly whisperings' and 'old sweet leaf sounds' brought home to her breast. The howling of the wind at night had a very peculiar effect upon her nerves—nothing in the least approaching to the sensation of fear, as few were more exempt from that class of alarms usually called horrors; but working upon her imagination to a degree which was always succeeded by a reaction of fatigue and exhaustion. The solemn influences thus mysteriously exercised, are alluded to in many of her poems, particularly in 'The Song of Night,'† and in 'The Voice of the Wind;‡ The sight and sound of the sea were always connected in her mind with melancholy associations; with

'Doubt, and something dark,
Of the old Sea some reverential fear.'

with images of storm and desolation, of shipwreck and sea-burial: the last, indeed, was so often present to her imagination, and has so frequently been introduced into her poetry, that any one inclined to superstitious presentiments might almost have been disposed to fancy it a fore-shadowing of some such dark fate in store either for herself or for some one dear to

* "Oh! fear thou not to dream with waking eye:
There lies deep meaning oft in childish play."

Thalia's Song, translated by Mrs. Hemans.

† "Among the many congenial ideas she found in the writings of Richter, the following passage relating to Night was singularly in unison with her own feelings:—
'The earth is every day overspread with the veil of Night, for the same reason as the cages of birds are darkened, that we may the more readily apprehend the higher harmonies of thought in the hush and quiet of darkness. Thoughts, which day turns into smoke and mist, stand about us in the night as lights and flames, even as the column which fluctuates above the gates of Vesuvius, in the day-time appears a pillar of cloud, but by night a pillar of fire.'"

‡ "Oh! many a voice is thine, thou Wind! full many a voice is thine!

From every scene thy wing o'er sweeps, thou bear'st a sound and sign:
A minstrel wild and strong thou art, with a mastery all thine own.

And the spirit is thy harp, O Wind! that gives the answering tone.

"Are all these notes in thee, wild Wind! these many notes in thee?
Far in our own unfathom'd souls their fount must surely be.

Yes! buried, but unslumbering there, thought watches, memory lies,
From whose deep urn the tones are poured through all earth's harmonies."

her. These associations, like those awakened by the wind, were perfectly distinct from anything of personal timidity, and were the more indefinable, as she had never suffered any calamity at all connected with the sea: none of those she loved had been 'consigned to its reckless waters, nor had she ever seen it in all its terrors, for the coast on which her early years were passed is by no means a rugged or dangerous one, and is seldom visited by disaster.'

In 1828 "The Records of Woman," the best known and most popular of all her writings, was published—and we have epistolary communications about the same period with Miss Jewsbury, Mary Howitt, Miss Baillie, and Miss Mitford. The study of Wordsworth and the German writers had opened up new fields for the exercise of her imagination, and imparted a tone to her mind, very different from what we find in her "Modern Greece," or her "Tales and Historic Scenes."

In 1829 Mrs. Hemans visited Scotland, and the circumstance seems to form an epoch in her history. The recollections of Sir Walter Scott, especially, are exceedingly interesting; but, as these have been before given in a great measure by Mr. Chorley in his "Memorials," we pass them over, and come to Mr. Wordsworth:—

"My nervous fear at the idea of presenting myself to Mr. Wordsworth, grew upon me so rapidly, that it was more than seven o'clock before I took courage to leave the inn at Ambleside. I had, indeed, little cause for such trepidation. I was driven to a lovely cottage-like building, almost hidden by a profusion of roses and ivy; and a most benignant-looking old man greeted me in the porch. This was Mr. Wordsworth himself; and when I tell you that, having rather a large party of visitors in the house, he led me to a room apart from them, and brought in his family by degrees, I am sure that little trait will give you an idea of considerate kindness which you will both like and appreciate."

• • • There is an almost patriarchal simplicity about him—an absence of all pretension. All is free, unstudied—

'The river winding at its own sweet will.'

in his manner and conversation. There is more of impulse about them than I had expected; but in other respects I see much that I should have looked for in the poet of meditative life: frequently his head droops, his eyes half close, and he seems buried in quiet depths of thought. I have passed a delightful morning to-day in walking with him about his own richly shaded grounds, and hearing him speak of the old English writers, particularly Spenser, whom he loves, as he himself expresses it, for his 'earnestness and devotedness.' • • • I must not forget to tell you that he not only admired our exploit in crossing the Ulverstone Sands, as a deed of 'derring do,' but as a decided proof of taste: the lake scenery, he says, is never seen to such advantage as after the passage of what he calls its majestic barrier.

"I have been making you a little drawing of Mr. Wordsworth's house, which, though it has no other merit than that of fidelity, will, I know, find favour in your sight. The steps upon the front lead to a little grassy mound, commanding a view always so rich, and sometimes so brightly solemn, that one can well imagine its influence traceable in many of the poet's writings. On this mound he frequently sits all evening, and sometimes seems borne away in thought."

"I seem to be writing to you almost from the spirit-land; all is here so brightly still, so remote from every-day cares and tumults, that

sometimes I can hardly persuade myself I am not dreaming. It scarcely seems to be 'the light of common day' that is clothing the woody mountains before me; there is something almost visionary in its soft gleams and ever-changing shadows. I am charmed with Mr. Wordsworth, whose kindness to me has quite a soothing influence over my spirits. Oh! what relief, what blessing there is in the feeling of admiration, when it can be freely poured forth! 'There is a daily beauty in his life,' which is in such lovely harmony with his poetry, that I am thankful to have witnessed and felt it. He gives me a good deal of his society, reads to me, walks with me, leads my pony when I ride; and I begin to talk with him as with a sort of paternal friend. The whole of this morning, he kindly passed in reading to me a great deal from Spenser, and afterwards his own 'Laodamia,' my favourite 'Tintern Abbey,' and many of his noble sonnets. His reading is very peculiar, but, to my ear, delightful; slow, solemn, earnest in expression more than any I have ever heard: when he reads or recites in the open air, his deep rich tones seem to proceed from a spirit-voice, and belong to the religion of the place; they harmonise so fitly with the thrilling tones of woods and waterfalls. His expressions are often strikingly poetical; such as—'I would not give up the mists that spiritualize our mountains, for all the blue skies of Italy.' Yesterday evening he walked beside me as I rode on a long and lovely mountain-path, high above Grasmere Lake. I was much interested by his shewing me, carved deep into the rock, as we passed, the initials of his wife's name, inscribed there many years ago by himself; and the dear old man, like 'Old Mortality,' renews them from time to time. I could scarcely help exclaiming 'Ete perpetua!'

"It is delightful to see a life in such perfect harmony with all that his writings express—

'True to the kindred points of Heaven and home!'

You may remember how much I disliked, and I think you agreed with me in reproaching, that shallow theory of Mr. Moore's with regard to the unfitness of genius for domestic happiness. I was speaking of it yesterday to Mr. Wordsworth, and was pleased by his remark, 'It is not because they possess genius that they make unhappy homes, but because they do not possess genius enough; a higher order of mind would enable them to see and feel all the beauty of domestic ties.' His mind, indeed, may well inhabit an untroubled atmosphere, for, as he himself declares, no wounded affections, no embittered feelings, have ever been his lot; the current of his domestic life has flowed on bright, and pure, and unbroken. Hence, I think, much of the high, sculpture-like repose, which invests both his character and writings with so tranquil a dignity.

"Mr. Wordsworth's kindness has inspired me with a feeling of confidence which it is delightful to associate with those of admiration and respect, before excited by his writings;—and he has treated me with so much consideration, and gentleness, and care!—they have been like balm to my spirit after all the *fades* flatteries with which I am *blasé*. I wish I had time to tell you of mornings which he has passed in walking to me, and of evenings when he has walked beside me, whilst I rode through the lovely vales of Grasmere and Rydal; and of his beautiful, sometimes half-unconscious recitation, in a voice so deep and solemn, that it has often brought tears into my eyes. One little incident I must describe.

We had been listening, during one of these evening rides, to various sounds and notes of birds, which broke upon the stillness, and at last I said, 'Perhaps there may be a deeper and richer music pervading all nature, than we are permitted, in this state, to hear.' He answered by reciting those glorious lines of Milton's,

'Millions of spiritual creatures walk the earth,
Unseen, both when we wake and when we sleep, &c.'

and this in tones that seemed rising from such depths of veneration! I cannot describe the thrill with which I listened; it was like the feeling which Lord Byron has embodied in one of his best and purest moments, when he so beautifully says,—

'And not a breath crept through the rosy air,
And yet the forest leaves seemed stirred with prayer.'

Mr. Wordsworth's daily life in the bosom of his family is delightful—so affectionate and confiding. I cannot but mournfully feel, in the midst of their happiness, 'Still still, I am a stranger here!'—but where am I not a stranger now?"

Mrs. Hemans afterwards settled in Dublin with her family. Her health had been, for several years, uncertain and declining, and there she died. Her death-bed was that of a Christian. After describing an illness long and wearisome, but patiently borne, the narrative thus concludes:—

"On Saturday, the 16th of May, she sank into a gentle slumber, which continued almost unbroken throughout the day; and at nine o'clock in the evening her spirit passed away, without pain or struggle; and, it is humbly hoped, was translated, through the mediation of her blessed Redeemer, to that rest which remaineth to the people of God. And those who loved her best—in whose hearts her departure has left an aching void, which they must bear with them to the grave—who feel that a light is taken from their path, which nothing earthly can restore—can yet thankfully and submissively acknowledge that 'it is well!'—can rejoice to think of her in safety and repose; and, with spirits chastened like her own, can bless their Heavenly Father, that now, 'of his great mercy,' after the toils and trials of her mortal career, 'He giveth his beloved sleep.' Her remains were deposited in a vault beneath St. Anne's Church, in Dublin, almost close to the house where she died. A small tablet has been placed above the spot where she is laid, inscribed with her name, her age, and the date of her death, and with the following lines from a dirge of her own:—

'Calm on the bosom of thy God,
Fair Spirit! rest thee now!
Ev'n while with us thy footsteps trode,
His seal was on thy brow.
Dust to its narrow house beneath!
Soul to its place on high!
They that have seen thy look in death,
No more may fear to die.'

A similar memorial, bearing the following inscription, is erected in the Cathedral of St. Asaph, beneath one which is consecrated to the remembrance of her mother:—

'THIS TABLET,
PLACED HERE BY HER BROTHERS,
IS
IN MEMORY OF
FELICIA HEMANS,
WHOSE CHARACTER IS BEST PORTRAYED
IN HER WRITINGS.
SHE DIED IN DUBLIN, MAY 16th, 1835.
AGED 41.'

We are glad to observe that something like chronological arrangement is to be preserved in the publication of the poetical works, as they will thus at once give a history of mind, and

form a commentary on the biographical narrative. The portrait affixed is from a painting by Mr. West, in the possession of the family. The likeness is good; and in the sentiment we have at once the mother and the poet.*

MISCELLANEOUS.

A Sketch of Native Education in India, under the Superintendence of the Church of Scotland, &c. &c. By James Bryce, D.D., late Chaplain, Bengal, &c. 8vo. pp. 372. London, 1839. W. H. Allen and Co.; Edinburgh, Blackwood.

A WORK upon a vitally important subject, to which we would direct the attention of readers of every degree. Education, so essential every where to the welfare of a people, is perhaps a more imperative want in our vast and populous Indian Empire than in any other quarter of the earth. And there, as elsewhere, it is most desirable not to confound the mere signs of things with what is good and beneficial instruction; to confound all schemes of reading and writing, or little else, with what alone truly deserves the name of education. It is, however, a subject too great for us to discuss here; and we have only to say that this volume, in a sketchy and detached, rather than in an analytical and elaborate view of the condition of the Hindus, gives us much insight into the principal matters to be considered, and means to be adopted, in regard to them.

The Manor of Glenmore; or, the Irish Peasant. By a Member of the Irish Bar. 3 vols. London, 1839. Bull.

A NOVEL upon Irish politics, of which we have far too much in other shapes, has few attractions for us. It is written, besides, in so tangled and stilted a style, that, even if the subject were attractive, would be equally repulsive. For example, of the simultaneous meetings of the people, it is written:—"Thus, while the meetings themselves were as members of the great frame-work of constitutional revolt, and the love of liberty its creative and animating spirit, and justice, reason, and eloquence the moral influences of its power, religious associations were its subtle ministers to the affections of the nation's soul, instinctively forming a brotherhood of millions, and making the land, as it were, a region of spirits, tremulously sensitive with sympathy." We confess this transcends our comprehension, though "the essentiality of the deed was clothed in a drapery of sacred love and beauty to the people's eyes," &c. &c. One might puzzle a good while over such sentences before they were understood. Perhaps they might produce a better effect, *vis a voce*, at the Irish bar than in the quiet shape of typography.

The Dukes of Normandy, from the Time of Rollo to the Expulsion of King John by Philip Augustus of France. By Jonathan Duncan, Esq., B.A. Pp. 303. London, 1839. Rickerby; Harvey and Darton.

As a companion to the "History of England," we can cordially recommend this excellent little work, derived from the best sources, ably written, and the result of a sound and impartial judgment. It is quite a pleasure to look upon some of our early Kings in their ducal robes and characters, from Rollo, through William

Longsword, the Conqueror, Henry I. and II., Cœur de Lion, &c., to John. Duden, Wace, William of Jumièges, Ordericus Vitalis, Augustin Thierry, and other eminent authors, have all been carefully consulted; and the result is one of the best books of its class, either for general reading or schools, which we have seen for a long while.

Black's British Atlas, No. I. Edinburgh, A. and C. Black: London, Longman and Co.; Simpkin, Marshall, and Co.; Dublin, Cumming.

THE first of a series of coloured and well-executed maps, to be extended to the number of fifty-two. It contains the World in Hemispheres, and on Mercator's Projection; Chart of Magnetic Curves; of Mountains and Rivers; of the Geographical Distribution of Plants; and maps of Europe; of England, north and south parts; and of Scotland, northern part. These are accompanied by concise descriptive letter-press; and the whole most usefully arranged to furnish, not only the usual information sought in such publications, but much of that additional collateral intelligence which the progress of science now demands in connexion with Geography. When we have seen more of the seven monthly parts of which this Atlas is to consist, we shall be better able to point out its particular merits.

The Accoucheur; a Treatise, &c., by John Craig, Surgeon, Paisley. Pp. 252. (Glasgow, M'Phun; London, Cotes; Edinburgh, Whyte and Co.)—A work of interest to medical practitioners, and of a nature not to be reviewed in a popular journal like ours.

Translations, and Sketches of Biography, from the Greek, Italian, Spanish, Portuguese, and French Languages, by a Lady. Pp. 356. (London, Saunders and Otley.)—A very agreeable and various miscellany, in prose and verse.

The Guide to Service; the Household. Pp. 72. (London, Knight.)—One of the useful little books which cannot but do good to those who read them, whether employers or employed.

The Difficulties of English Grammar and Punctuation removed, by J. Best Davidson. (London, Simpkin, and Marshall; Hamilton, Adams, and Co.)—Issuing from Leeds, and altogether a very judicious and instructive grammatical work.

Bingley's Guide to North Wales. Pp. 356. (London, Longman and Co.)—This is a third edition of a well-known work, and deservedly popular with Welsh tourists. Corrections and additions, up to last year, render it still more worthy of being adopted as a pleasant guide.

The Inquiries of the Opium Trade with China, &c., by the Rev. A. S. Thelwall, M.A. Pp. 178. (London, Allen and Co.)—Many persons connected with the East entertain strong objections to the opium trade, and they are here embodied in a popular form. The question is one of much importance upon which we see not sufficiently informed to pronounce a judgment.

Authenticated Report of the Discussion between the Rev. T. D. Gregg and the Rev. T. Maguire. 8vo. pp. 616. (Dublin, Gorton; Robertson; Bleakley.)—"The Church Edition" of this celebrated polemical controversy. Though the subject is one of national and vital interest, it must be left by us to its own merits, with the simple statement that such a volume is published.

Deafness Cured by clearing out the Throat to the Ear, &c., with Notes and Cases, by J. Yearley. Pp. 53. (London, Nisbet.)—Mr. Yearley, surgeon to the New Aural Institution in Sackville Street, states that he is the first practitioner who has introduced this system into England; and he cites many cases in support of its excellence as a means of cure.

The Principles of Modern Dissident Evangelism Disclosed, and the Church of England proved to be the only Conservatrix of the National Faith, &c., by the Rev. H. Cole. Pp. 36. (London, Nisbet and Co.; Seely; Hatchard.)—These letters, addressed to Dr. P. Smith, on his geological lectures, are here collected from the "Times" newspaper; where, of course, they have become so generally known as to require no description from us.

Spain; its Present State and Prospects, by an English Traveller. Pp. 65. (London, Smith, Elder, and Co.)—Our traveller takes a very favourable view of the resources of Spain; declares that the country is greatly improving in many respects; and contends that its public credit ought to stand much higher than it does in the opinion of the money market.

The Gentle Boy; a Thrice-told Tale, by Nathaniel Hawthorne. (Boston, Weeks, Jordan, and Co.)—We confess we cannot tell what to make of this sentimental rhapsody. There is a pretty outline illustration.

Indecision; a Tale of the Far West, and other Poems, by J. K. Mitchell, M.D. Pp. 212. (Philadelphia, Carey and Hart.)—Another American production, in which Dr. Mitchell amuses his professional hours of relaxation with Scotch and other poetry. We fear we cannot justly promise that it must of necessity amuse others.

Old and New Logic Contrasted, &c., by Justin Brennan. Pp. 224. (London, Washbourne; Edinburgh, Fraser and Co.; Dublin, Cumming.)—Mr. Brennan is so enchanted with Bacon, that he writes down Aristotle an ass. Much we admire the former, and the sure system of which he was the mighty leader, and cannot go along with the writer in his depreciation of one of the greatest men the world ever saw.

The Buds of Hope; a Collection of Miscellaneous Poems, by Margaret Richardson. Pp. 218. (London, Mitchell and Son.)—The fair writer is full of good feelings, and has many tender and natural thoughts in these pages. More we cannot say.

Suggestions for a General Equalisation of the Land-Tax, &c., by S. Miller, Esq. Barrister-at-Law. Pp. 61. (London, Butterworth.)—The object of this pamphlet is an important one, viz. an Equalisation of the Land-Tax where possible, and a consequent reduction or abolition of the Malt-Tax. The legal questions involved in the discussion rather take it out of our province, but we may with much propriety recommend it to the public consideration.

Mrs. London's Ladies' Flower Garden. No. VI. (London, W. Smith.)—This is a beautiful No. to the plates very rich, and charming specimens of lovely flowers.

The Autobiography of Simon Patrick, Bishop of Ely. Pp. 287. (Oxford, Parker.)—This life, of a learned, pious, and divine is now first printed from an original MS. There is some curious personal and ecclesiastical matter in it, and some of the notices of 1688 are of historical interest.

Gray's Elegy in a Country Churchyard, &c. (London, Van Voorst.)—This is an edition of one of the most popular poems in the English language, embellished with above thirty beautiful woodcuts after Barrett, Copley Fielding, Constable, Cattermole, T. Stothard, Dewint, Boxall, S. A. Hart, T. and C. Landseer, F. Howard, Westall, Callcott, J. H. Nixon, Cooper, Mulready, Wright, Chalon, Stanley, T. Fielding, and Collins, all engraved in the best style of the art. The variety of the designs affords a very interesting display of the talents of these distinguished illustrators. But the volume is rendered still more acceptable by containing versions in Greek, by W. Cooke; in Latin, by W. Hildyard; in German, by a translator, who subscribes himself Götter, in the *Deutsches Lesebuch*, where it was published; in Italian, by F. Tordelli; and in French, by Le Tourneur. This polygot, with all the curious turns of expression in the several languages, is quite a lesson in poetical composition. Some of the Greek verses are very fine and musical;—the Italian, not so much so as we expected. Altogether, however, this edition of the *Elegy* deserves our hearty eulogy.

Researches on the Development, Structure, and Diseases of the Teeth, by Alexander Nasmyth, F.R.S., F.G.S., &c. 8vo. Pp. 171. (London, J. Churchill.)—A very complete treatise, with plates executed in the most skilful manner.

Selections from the Fifth Book of Hooker's Ecclesiastical Policy. Pp. 388. (Oxford, Parker.)—A more valuable divine could not have been sought to supply a volume of sound religious instruction; and every Christian must applaud the means taken to extend and make popular say portions of the writings of Hooker.

The Miller's Daughter, a Comedy; and Miscellaneous Poems, by John Purchas, a Rugbyman. Pp. 364. (London, Whitaker.)—We are sorry that we can award no prize to this attempt. Rugby, to be famed, must produce another bard.

ARTS AND SCIENCES.

LYNNÆAN SOCIETY.

MR. FORSTER in the chair.—Among the specimens exhibited, were two fine plants in flower, of the splendid *Curcuma Roscoeana*, which had been sent to the meeting by his Grace the Duke of Northumberland, from his magnificent collection at Syon House. The chairman read a letter, addressed to the Society, from Upsal, announcing the death of Louisa Von Linné, the third and last surviving daughter of Linneus, which took place in that city on the 21st of March, at the advanced age of ninety. Read, a 'Biographical Sketch of Ferdinand Bauer, Natural History Painter to the Voyage of Capt. Flinders,' by Dr. Lhotsky. This celebrated natural history painter and traveller was the younger brother of Francis Bauer, F.R.S., and was born in the year 1760, at Feldsberg in Austria, where his father held the appointment of painter to Prince Lichtenstein. In 1784 he was, through the recommendation of the elder Jacquin, engaged by Dr. Sibthorp, to accompany him in his first journey to Greece; and on his return, he was for several years occupied in finishing the numerous drawings made in that journey, and which prove him to have been, even at that period, a very accurate observer, as well as a

* To this review we may add, that some of Mrs. Hemans's most touching minor poems originally appeared in the *Literary Gazette*; and if we look at her course of composition, it will be felt that the productions of the lamented L. E. L. exercised a very marked influence upon her muse. From that time, what was, to a certain degree, cold and classical, became more animated, natural, and passionate. A great difference was wrought, both in her style and sentiment, by the example of that gifted child of song.—Ed. L. G.

highly accomplished artist. In 1801, Mr. Bauer was selected by Sir Joseph Banks, as natural history painter to the voyage of Capt. Flinders, to which Mr. Brown was also attached as naturalist. From this expedition, Mr. Bauer returned to Europe in 1805, bringing with him no less than 1600 finished sketches of plants, besides numerous drawings of animals of equal merit. After the ship Investigator was condemned as unfit for the further prosecution of the voyage, and Capt. Flinders had left New Holland to return to Europe, Mr. Bauer, along with Mr. Brown, remained in New South Wales, chiefly at Port Jackson; but he also visited and remained a considerable time in Norfolk Island, where he diligently collected and made drawings of all the plants of that remarkable spot; and from his materials Dr. Endlicher has lately published his interesting "Flora Insulæ Norfolkicæ." In 1813, Mr. Bauer commenced the publication of a splendid work on the plants of New Holland; but which, from the little encouragement it met with, did not extend to more than three numbers. During his stay in England, he prepared the drawings for the first volume of Mr. Lambert's splendid work on the *Genus Pinus*, and the plates to the original copies of that work were chiefly coloured by him. He also made a series of drawings of the species of *digitaria*, since published by Dr. Lindley.—Read, likewise, a notice of a plant which produces perfect seeds, without any apparent action of pollen on the stigma, by Mr. Smith; and 'Descriptions of newly discovered Spiders,' by Mr. Blackwall. Mr. Smith's paper was accompanied by several beautiful drawings of the parts, by Mr. Bauer; and also by a young plant raised from seeds produced in the Royal Botanic Gardens at Kew. Mr. Woods presented specimens of *Habenaria alba*, and *Genista pilosa*, gathered by himself during the past week on Ashdown Forest, Sussex.

GEOGRAPHICAL SOCIETY.

JUNE 10. G. B. Greenough, Esq., President, in the chair.—The following papers were read: 1. 'Extract from a Letter from Professor Adolph Erman, of Berlin.' "In presenting my map of Kamchatka to the Geographical Society, I must state that the publication has been retarded by the care with which I have superintended the engraving. As to my undertaking this map, and the circumstances which may obtain for it some interest, I must refer, in the first place, to the first volume of the scientific part of my account of my journey, where (at pages 209, 289, 346, and 387) I have collected my observations on latitude and longitude for twenty points in this peninsula; and have given the barometric measurements of the elevation of its mountains and plains. I have compared (page 349) the dimensions of the country according to existing maps, with those assigned to it by my observations. They will be seen sometimes reduced to two-fifths of the size falsely attributed to them; and the result is, that this province of Russia might be ranked almost as a *terra incognita*. I may also add, that some of the more recent maps have doubled the whole of an existing series of localities, for we see the names of Kamchatka habitations situated between the port of St. Peter and Paul, and the sources of the river Kamchatka, noted down a second time along the direct line between the said port and the town of Bolshereak. The fact is, that all the said villages twice mentioned, exist but once, and that the compilers apparently did not know that steep mountains prevent travellers going straight from St. Peter and Paul to

Bolshereak, and oblige them, on the contrary, to return at first towards the north, on the same road which leads to the sources of the Kamchatka, and to return towards the south-west, after having reached a large ravine that opens transversely in the body of the mountains, which are on the borders of the river Avatsha. I have thought right to dwell upon these corrections in the delineation of the form of the country, and its conformation, because they alone can offer a solid basis to the comparative combinations of geology, and authorise our theories upon the volcanic character of the peninsula, as well as upon the origin of its mountains, its lakes, its eruptions of thermal waters and vapours. I shall soon publish a circumstantial account of my visit to Kamchatka, which will supply all that must be deficient in a map, on the points I have alluded to, and I now content myself with some preliminary observations upon the general character of the geological phenomena of this country, which, from its position upon the natural limits of the old Continent, seems to deserve particular attention." The map of Kamchatka, accompanying this letter, is on a scale of three inches to a degree, and represents the two remarkable and almost parallel chains of *sopkis*, or volcanoes, which extend in a north and south direction, throughout a great portion of the peninsula, and one of which, namely, Kluchefakain, in latitude 56° 8' N., rises to nearly 16,000 feet above the sea.—2. Captain Sir James Stirling, R.N., gave an account of 'The Progress of Discovery in Western Australia, and of the Harbour named Warnborough Sound, lying immediately to the Southward of Cape Peron.' Touching briefly on the history of this territory, from the time it was first visited by the Dutch in 1625, and by the French under Baudin, in 1801, Sir James came down to the period when it was first settled by the English, in 1827, and drew a comparison between the view as then seen from the summit of the mountain range, and at the commencement of the year 1839, when he quitted the colony, at which time symptoms of civilisation and prosperity were evident all around; even mails are now carried, and shops kept by natives in districts which ten years ago had never been pressed by a white man's foot. Sir James then gave a summary of the routes of several explorers, as Dale, Roe, Bunbury, Bannister, &c., as laid down on a map of the colony on a large scale which he had brought home with him for the Colonial Department (by whose permission it was exhibited at the meeting), and spoke in high terms of the ability and diligence shewn by Lieut. Roe, R.N., surveyor-general of the colony, in combining these itineraries, and reducing to order materials occasionally not very easily to be dealt with. He described Warnborough Sound, a recently discovered harbour, about fifteen miles south of the entrance of Swan River, lying between Penguin Island to the north, and Point Becher to the south, which he had examined in company with the surveyor-general. This sound is about 3½ miles long, by 2½ wide, and sheltered to the west by a reef of rocks extending from each shore, and leaving in the middle a passage with five fathoms water; but as there are probably sunken rocks in it, and as Coventry Reef lies only about 2½ miles due west of the entrance, it would not be safe for ships to run for this anchorage, without being acquainted with the leading marks for avoiding the dangers. Within the reef is a fine sound, having not less than six fathoms water; and at its northern part a small port, named Safety

Harbour, where is deep water close to the shore. In conclusion, Sir James Stirling directed attention to Shark's Bay on the west coast, and the head of the Australia Bight on the south coast, as points well deserving a careful examination by our nautical surveyors. A plan of Rottenest Island, and the approaches to Swan River, as surveyed by Captain Wickham and the officers of the Beagle, was laid upon the table by permission of Captain Beaufort, R.N.—3. 'The Personal Narrative of the Pashá of Egypt from Cairo to Fazoglo, on the Blue Nile, in 1838-9.' Translated from the Turkish, and communicated by Dr. Bowring. Leaving Cairo, in a steamer, on the 15th October last, the pashá and his suite, including several European engineers, &c., ascended the course of the Nile as far as the cataracts of Es-suan, which they reached on the 28th; the vessel having only grounded once at Atfiel, about seven hours above Cairo. Embarking here in a dahabíyah, as the steamer could not pass the narrows, they passed Dongolah, and proceeded on to Ambukol, when they landed, and crossed the desert of Bayúdeh, reaching the Nile again at Jebel Raiwan, and thence went to Khartúm, at the junction of the White and Blue Rivers. Stopping here for a few days, the party proceeded by Wad Medinah and Sennár to Rosseios, where they arrived on the 25th December, and remained a fortnight. On this part of the route a great quantity of birds were met with; guinea-fowls, wild geese, storks, pelicans, ostriches, &c., abound. Continuing their journey, they slept the first night at Farusto; the second, at Jelúl; the third, at Kayar; and on the fourth day, the 13th January, reached the mountains and village of Fazoglo, on the west bank of the river. The pashá remained some time here, and gave orders to build a house for himself, and magazines for provisions and ammunition, on an eminence nearly surrounded by water on the opposite bank of the stream. He strictly forbade the continuance of the gazá, or slave hunts; and set at liberty a number of prisoners taken at Kordofán. From Fazoglo, the pashá advanced to Fazangoro, whither Khoerú Effendi, and Messrs. Lambert and Boreani, engineers, had preceded him to examine the district and search for gold dust. After having explored the torrent Khor el Wadi from its source to its mouth, and ascertained that the sands are equally rich throughout its whole extent, he descended, on the 31st January, from the mountains of Fazangoro to the plains, and selected the point of junction of Khor el Wadi with the Bahr el Azrek, as the site of a town to be named after himself, Mohammed 'Ali, and in which 1500 families from Fazoglo are to be located, in order to work the gold mines. After having received with great kindness all the neighbouring sheikhs, and urged them to cultivate the ground, and to send their children to Cairo for instruction, the viceroy departed, on his return to Egypt. At Khartúm, he gave permission to the Christians to erect a church: at Dongolah he proclaimed the freedom of trade in indigo, which this province and Berber produce in great quantities; and, leaving Mr. Lambert to make a report on a projected railroad across the desert from Abú Mohammed to Kuruakú, and another on the formation of a canal between the White River and Kordofán, in order to furnish water to irrigate the land, and to facilitate the carriage of the iron from the mines which exist in the neighbouring mountains, he continued his journey; and, on the 14th March, the cannon of Cairo announced to Egypt the return of the

and simple method of instruction in the art of drawing, upon the only solid basis of science." Mr. Howard maintains that drawing should form a principal part of the education of every one; ridicules the idea that all proficient in drawing must belong to a more gifted class of the creation; condemns the system of beginning with difficult details; contends that any one who can write can draw; shews that the first and indispensable qualification of drawing, as a means of communicating ideas, is that it should convey a distinct and intelligible impression, for which purpose it must possess character; points out that every class of objects has its characteristic forms; and recommends that the roughest, rudest general characteristics, should at first be attempted, to which details should be added, as the hand acquires facility, and the head knowledge to direct it. These general principles Mr. Howard proceeds fully, and with great ability, to illustrate in a series of plates, strikingly exhibiting the distinct characteristics of different kinds of trees. In the lettering of two of these plates, we observed an error, which, though slight, may mislead a young person and a beginner. P should have been O, and O should have been P.

ORIGINAL POETRY.

ROSES.

A Fancy Song, suggested by the Horticultural Fête of the 15th instant.

It was, indeed, a fairy scene of fragrance and of flowers; Delicious music filled the air, Beauty adorned the bowers; The fruitage of a hundred shores met in that favour'd spot—

Pomona gems, the rich and rare—transient, yet unforget; What marvel that the sylvan god once left his forests green, (queen?)

With rural pipe to serenade the orchard's blooming What marvel if, with Flora by, between the tempting two, (woo?)

He stood, the image of despair, and knew not which to I've gazed on many a goddess bright—their kisses and their smiles (lakes?) Have blest alike my lip and eye, 'mid fancy's vision'd But still, despite the magic art that with the poet dwells, What are they all, compared with one of Beauty's earthly spells?

Away! away! who talks to me of amethyst and pearl? Why, I would rather have one smile from yon light-hearted girl,—

One murmur of her lip of love,—one pressure of her hand, Than all the wealth of rich Peru, or gems of Samarcand.

Red roses garland Hymen's shrine, the fragrant and the fair, (there?)

But not a flower of beauty's bowers, blooms ever single Lightly Love waves his fairy wand, and, lo! a morn's single rose, (blows?)

Ere shine the stars,—a blushing bride, a double floweret Oh! would I were a gay parterre, adorned by Flora's hand, Gifted with Hymen's magic fane, and Cupid's fairy wand,— (should mingle?)

Then should my motto "union" be; flowers of all sorts But not a rose-bud of them all should bud to blossom single!

June 18, 1838.

HENRY BRANDRETH.

LINES,

Written Extempore at the Plain of Waterloo, by Sir Richard Paul Jocrell, Bart., M.A., September 23, 1838, and printed for the Benefit of the "British Charitable Fund" at Brussels.

E'EN yet I seem to hear the cannons roar, Where Gallia's eagles conquering trophies bore; Where the stern Tyrant's yet undaunted force With troops unnumber'd measured horse to horse.

But see! the Cœur de Lion of his day, With brave allies, cuirass'd in war's array; The British lion to th' attack leads on, For victory, or death,—heroic Wellington! There Scotia's Greys the furious charge withstand,

Defy the Gallic chieftain's legion band; 'T was then the proud Napoleon felt dismay, Pall'd at the sight of British chivalry.

'T is done, how chang'd, how tranquil, now 't is o'er!

No sound is heard aloof, no cannons roar:

For all is hush'd in death; and warriors brave Sleep the long sleep within the ravine's grave. See where the ploughman wends in lonely toil, And Belgian palfreys till the yielding soil; Not steeds like those that bit th' ensanguin'd ground,

When bombs terrific hurl'd destruction round. How many thousands lie entomb'd in earth, Where now the harvest smiles and rural mirth! Departed spirits flit along the air!—

No funeral pomp, no coffin pall was there!— The warrior's mantle wrapt the cold remains, And the dank sod no vestiges proclaims; Save where as yet we trace the murd'rous ball, Rife in the clod, and relic of the soil; The batter'd walls of Hougoumont before, Or where Haye Sainte's enriched by human gore.

Ah! yet before we part, I linger here; Peace to their manes, drop a pious tear: Here Grose, here Staples fell! and Howard there; (spare!)

Not "All the blood of Howards" life could Friends of my earliest youth!—Etonian friends! To ye, Melpomene her tribute tends.

Now, lo, thy tablets fade! and ruthless Time Deigns not to spare e'en records such as thine. More lasting monuments thy country gives, Grateful to patriots all, your memory lives.

Though more than twice ten years have long since past, (last;)

Such names, such honour, and such praises And e'en in history's far recorded page Shall last,—the glory of the future age.

Whate'er we read of Xerxes' arms of old, Of fell Darius, or of Cyrus bold;

Whate'er of Agincourt's or Poitiers' name, And Edward's laurels gain'd by Crecy's fame;

Whate'er of chivalry's romantic charm; Or Blenheim's battles won by Marlborough's arm;

The palm is greater, Waterloo, to thee; Peace to the world, compatriot Liberty!

SKETCHES.

THE PICTURE OF COLIAS PER.*

HE is somewhat round and corpulent, not that he is big with fat but swell'd with being soe full of himself.

He hath a kind of leaden look or hereditary heaviness by descent, tho he disguiseth it now and then with a small conceit.

He rangeth up and down like a spaniell and waggeth his tongue as a dog doth his taylor.

He is not of a shape for a Lap dog and yet the beast will be lolling in chaires and pretending to Ladies.

He Loveth Having and his devouring eye giveth him such a property in every thing he seeth that he thinketh the man committeth robbery who keepeth his own from him.

Theres not a place in Court from the Treasury chamber to the scullery y' he hath not layd his hand upon.

And if he was to marry againe he would put them every one into his noeing particular.

He doth not desire things like other men but length for them like great belly'd woeman or girls in the green sickness.

You halfe murder him if you denye him.

He is like a Child that is allway either sucking or cryeing.

* The MS. whence the above character is printed is in an old hand, and seems to be about the middle of the 17th century. It was found among a mass of other and various papers in the muniment room of a nobleman of high rank; but to whom it refers, or if original and unpublished, are circumstances which we cannot ascertain. We copy it on account of its extraordinary and pithy bitterness; and as perfect a model of sarcasm and severity as could be expressed in the English language.—Ed. L. G.

Every moment he ceaseth to get the great baby is vnquiet and bawleth.

He would sue the world for not doing him right and take all that is in it for damages if he might be Judge in his own Case which he always thinketh very reasonable.

He canot spare a thought to any thing but as it may tend to doe him good.

And being odious to all mankind he thinketh he is bound to make himselfe amends by an extraordinary passion for his own sacred person.

His religion consisteth in worshipping himselfe a worse kind of Idolatry than those that erect Altars to rats and Polecats.

As malice is the effect of other men's wit it is the Cause of his.

For he can noe more speak well of any thing than a man can with a safe conscience doe soe of him.

Yet he doth not hate a foole because he wanteth sence but because he is opposite to a knave.

He keepeth his frinds as he doth his ***** onely for present vse.

He carieth about with him the disease of Envy as a vengeance from heaven.

For he taketh noe pleasure in being rich because there are richer.

And whilst There is one happy man in the world by his nature he must be miserable.

The vngratefulest of men to that God who he thinketh made the world onely for the vse of him and his family.

He differeth from Judas onely in this that he would not have sold our Saviour soe Cheape.

He is a master piece of nature which as it never did before, soe it never can againe make such a scurvy thing if it should goe about it.

His Sister is a Counterpart of the Monster and if the race of devills were Extinct they twoe in Conjunction would raise a new one.

MUSIC.

Philharmonic Society.—The eighth concert of the above Society took place on Monday last, and was, with one or two exceptions, worthy of being the *finale* to the season. Spohr's *sonfonia*, No. 3, was executed admirably, but we cannot say we *admire* such ponderous compositions; we are not yet persuaded that sterling value consists in weight: it is the *ring* that distinguishes the true metal from the base, not the specific gravity. A *Mlle. Meert* sang *Mercadante's* "Se m' abbandoni;" her voice is a rich *mezzo soprano*, and her style is very pure, but it appeared to us that her cadences were always left unfinished: we should say, from some mismanagement of her breath. However, this corrected, she will prove a valuable acquisition to the corps of *cantatrici* now in England. Mr. Döhler played a *fantasia* of his own; and we are sorry that we cannot award him the praise that our contemporaries lavish upon him: mere manual dexterity is a poor substitute for expression in performance, and complicated harmony a bad *locum tenens* of melody. If Mr. Döhler will be of the Thalberg school, let him study its beauties, not its faults. Madame Dorus Gras sang Meyerbeer's "En vain j'espère" in her best style, and Beethoven's overture, "Fidelio," concluded the first act. The second opened with Beethoven's symphony, No. 4. Really we are at a loss to pronounce which of this great man's compositions delight us most; we can only ejaculate with Hamlet,—

"We never shall look upon his like again."

The band, led by Loder, and conducted by Moscheles, did him ample justice. Signor Mario, whom we now pronounce to be one of the finest tenors of the day, sang, with the purest taste and feeling, Meyerbeer's "Sarna funerea," from "Il Crociato in Egitto;" and a concerto of Mayrader's, performed by Blagrove, followed. The death of poor Mori has placed this young man in an enviable situation, at the head of his profession: his performance was masterly. A trio was effectively sung by Dorus Gras, Mario, and Giubelei, and an overture of Romberg's concluded. We must not neglect to mention the high yet proper tribute paid upon this occasion to the memory of Mori. Previously to the commencement of the concert, the "Dead March in Saul" was performed by the whole band; and many of his associates we observed to be deeply affected.

Hanover Square Rooms.—On Tuesday, Miss. Katharina Bott and Mr. F. Chatterton's morning concert was very fully attended; the vocal music generally consisted of old favourite airs from popular operas, all of which were well executed. Mr. F. Chatterton on the harp delighted us much: we only regretted he did not play more. Miss. Bott played a concerto on the piano with great execution; also a fantasia for the left-hand alone, which she managed with extraordinary facility, and was loudly applauded. Madame Albertazzi's "Non più Mesta;" Madame Stockhausen's "Die Kindheit;" the duet, "Sull' Aria," by the same ladies; Herr Lidel's violoncello solo; and Mr. Richardson's fantasia on the flute, were each and all great musical treats.

Mr. Kollman's fourth concert on Wednesday was also fully attended. These concerts are given by Mr. Kollman in order to display the powers of his patent pianoforte, and if we may judge from the applause bestowed, his purpose has been fully answered.

We seem concert mad, and if not, ought to be a musical people. There are several almost daily; and all the high talent now congregated in London is produced to attract the crowds by which most of them are attended. To-night we see there is one for Miss Johnston, whose appeal is strengthened by her parentage and family circumstances. On Friday, Mrs. William Seguin and Mrs. John Hullah (both Academy pupils), announce a charming treat, including the last appearance of Dorus Gras.

THE DRAMA.

Her Majesty's Theatre.—On Saturday, Miss. Pauline Garcia appeared in *La Censurata*, and we left the theatre with mixed feelings of pleasure and disappointment: pleasure at hearing a voice of rich melody and extraordinary compass execute many sweet passages of music with feeling and taste; disappointment: that the whole was less excellent than certain portions; and disapprobation that so young and promising a creature should be there to sustain the weight of an opera—a task to which she is not yet equal, either with justice to the composer or herself; and where, on the alternate nights, long-practised and mature prima donnas, in the very zenith of their powers, make the contrast more unfavourable. It is impossible to judge of Garcia's power of attracting a full house, since there can be no doubt the *ballot* with Taglioni is now the lodestone of fashion.

Drury Lane.—Mr. Russell, one of the most distinguished contemporaries of the Kings and the Bannisters, and nearly, if not quite, the last survivor of the Augustan era of English

comedy, has advertised a benefit at Drury Lane on Monday, when a new opera is to be produced, supported by the most eminent vocalists of the time. We earnestly hope the public will, as in the recent case of Mrs. Bayly, remember how strong a claim upon its sympathy is advanced in the person of the inimitable *Jerry Sneak*.

Covent Garden.—*King Henry V.*, as we thought it would, and as it most richly deserves to do, fills this theatre to an overflow four times a-week; so that we trust, even in the least glorious sense, the liberal spirit of its management will meet with a suitable return. The public, it seems, are not to be persuaded by most acute criticism, that the nearer to perfection Shakspeare is produced upon the stage, the worse it is. Ignorant people will admire exquisite scenery, appropriate illustration, and splendid and accurate costume; just as they like the text of books not a bit the less for being beautifully embellished by the painter and engraver. This is passing strange; but such is the perversity of taste, and we must submit to the provoking fact of Macready's success in having adorned a fane worthy of the immortal bard of Avon.

Strand Theatre.—Mr. Hill has been playing some of his Yankee characters with great success here; and the little theatre in the Strand now ranks as one of the most popular places of amusement in London.

VARIETIES.

The Nelson Monument.—It is stated, that the decision upon this National Work of Art is to be given to-day; and we hear it whispered that there is a strong party in the Committee in favour of certainly the least original design, and hardly the most characteristic,—a Column. The Duke of York's Pillar, and the Monument, are fair specimens of what can be done in this style of art; and we do not think they hold out very strong temptations to an increase of the number of such embellishments in the metropolis. There is, however, no accounting for tastes; and we do not know but that Lot admired his wife when she was turned into a similar form. The whole business, we fear, will but illustrate the inexpediency of general competition in such cases.

The Young Giraffe.—We some time ago mentioned that the giraffe in the Zoological Gardens was with young; and we have now the pleasure to say that she has given us the first of the species ever produced in Europe. It is a fine male, reaching about six feet, and is doing extremely well. The weather is very favourable.

Gallery of Natural Magic.—Under this name, an exhibition of a new and most delightful kind has just been opened at the Colosseum. The apparatus is of extraordinary power, and the illusions in optics, electricity, &c. &c. are such as to excite equal pleasure and astonishment, while they convey to the mind striking information on many points of science, which thus seen can never be forgotten. It is, indeed, a resort to which we advise young and old to go for recreation and instruction.

Pathological Anatomy.—Dr. F. Thibert's unequalled collection of models for the study of medical science have arrived in London from Paris. In these he represents internal and external diseases with perfect identity by compositions in relief; and it is impossible to speak too favourably of their accuracy and value.

H.B.'s.—Three more! Nos. 595, 6, 7. The first, "Gulliver (Lord Melbourne) and his

Nurse" (Wellington), in the situation described Chapter V. of the "Voyage to Brobdingnag." The Queen is in the background, dreadfully alarmed for her favourite; but it is evident that the nurse will rescue him from his dangerous predicament. The next is a "New Patent Safety Cab;" Lord J. Russell and Sir R. Peel driven by Whittle Harvey. The last, a glorious female group at "Child's Play." The Queen is in the circle, and round her, linked hand in hand, the Duchess of Sutherland, Lady Normanby, and the ladies of the bedchamber, all shouting in chorus, "Can't get out! can't get out!" It is a merry and lively piece.

Gustave Adolphe Bassie.—This extraordinary boy is, we hear, again in London, after performing a tour in the provinces, and in Scotland and Ireland; where the demonstration of his wonderful powers of memory have been very highly appreciated by the learned and scientific, as well as by the general classes of society. At Edinburgh, Glasgow, Belfast, Dublin, &c., he exhibited his Mnemonic System to the astonishment of numerous audiences; and, we believe, he is about to repeat these proofs of its capabilities under the highest patronage in the metropolis. How far his own genius can be communicated so as to make his process available in education we cannot determine, but it is surely worth a careful and patient trial.

Cambridge Antiquarian Society.—We have much pleasure in stating that a society has recently been formed for the encouragement of the study of the history and antiquities of Cambridge and Cambridgeshire, and already bids fair to produce most important results. At the head of the society is the Rev. the Master of St. John's College; the office of secretary is filled by J. O. Halliwell, Esq., of Jesus College; and that of treasurer, by the Rev. J. J. Smith, of Caius College.—*Cambridge Chronicle*.

Earthquake.—Earthquakes are rare in England; but at 8 A.M. on Tuesday, the 11th inst., a shock was experienced near Manchester, and yet more sensibly about Burnley.

COMPANION TO FOISSAULT.

On the 1st of July will be published, Part I. price Two Shillings.

THE CHRONICLES of MONSTRELET.

With Notes and Woodcuts.

Uniform with the present Edition of Froissart.

As nearly as can be estimated, the work will be included in Twelve Parts; but will certainly not exceed Thirteen.

"The Chronicles of Froissart, and take up the general history of Europe, from the point at which that work terminates. Extending over a space of fifty-three years, they furnish as minute details of the occurrences of the times as the volumes of his celebrated predecessor; and they are further distinguished by the greater accuracy of the dates and the singular fidelity of his transcripts of public acts and original documents. This accuracy has rendered the 'Chronicles of Monstrelet' one of the most valuable storehouses from whence more modern historians have drawn materials for the correction of the errors or misrepresentations of contemporary writers, and they are esteemed accordingly. But this business-like accuracy has not interfered with the spirited flow of narration, which so charms us in the pages of Froissart; we may point to the accounts of the battle of Arincourt as a striking instance of his descriptive power."

"The character of Monstrelet," says the writer of his life in the "Biographie Universelle," "stands high as a historian. He narrates, Haile, Morel, le Père Leclerc, Poppens, Duverdiere, Deschamps, Sorel, Lenglet-Dufresnoy, all unite in praising the accuracy of his dates, the simplicity (accuracy) of his style, and his exact narration. His work is a rich mine, which may be explored with advantage by the philosopher who labours to ascertain facts, and to trace the causes which have influenced the springs of action."

London: William Smith, 113 Fleet Street; Fraser and Co.

Edinburgh; Curry and Co. Dublin.

BOOKS PUBLISHED THIS DAY.

GEORGE CRUIKSHANK'S NEW WORK.

Square 16mo. price 2s. cloth.

Waterloo Place, Pall Mall.

The Volumes of this Work are included in the List of

Books recommended by the Society for Promoting Christian

Knowledge.

Digitized by Google

Now publishing, in Monthly Volumes, price Five Shillings each,

A COMPLETE AND UNIFORM EDITION OF WORKS OF MRS. HEMANS, WITH A MEMOIR BY HER SISTER.

Embellished with a Portrait of Mrs. Hemans, from an original Picture in the possession of her Family; a Portrait of her Mother; and appropriate Landscape Illustrations.

The whole Work will not exceed Six Volumes. The First, containing the Memoir, &c. was published on the 1st of June.

Volume II. will be published on the 1st of July, containing—

Tales and Historic Scenes—The Restoration of the Works of Art to Italy—Modern Greece—Translations from Camoens, and other Poets—Miscellaneous Poems—Italian Literature.

The following are a few of the Critical Notices of the First Volume which have appeared:—

LITERARY GAZETTE.

"For many reasons we are pleased to see a complete and uniform edition of the works of Mrs. Hemans announced, in a style and elegance befitting their merits. The demand for such a publication shews a healthy taste in the public; and we doubt not its acceptance with readers will be equivalent with its just deserts. It can scarcely be otherwise, for most assuredly Felicia Hemans is now a British classic."

"The preliminary volume on our table is almost entirely occupied by a very interesting memoir of Mrs. Hemans, from the pen of her sister (Mrs. Hughes); and from this narrative we now give two or three extracts. Hitherto the biographical notices of this distinguished lady have been most desultory and conflicting; some of them, we might say, almost purely imaginary."

SPECTATOR.

"This elegant collection of the works of Mrs. Hemans will, no doubt, receive an ample encouragement from that class of readers who prefer the superficial but pleasing qualities of an interrupted flow of harmonious verse, great elegance and variety, if not always exact propriety of illustration, and a fanciful and excited sensibility, to the sterner or more homely reflections of truth and nature. Even those who think that poetry is a distillation of life and experience, rather than an outpouring of a day-dreaming fancy, will deem it necessary to procure the works, if they wish to enrich their collection with varied specimens of art; for, of the elegantly romantic school, Mrs. Hemans, if not the founder, is at least the head."

"Except occasional juvenile productions, freely intermingled with the memoir as biographical illustrations, the poems in the volume before us are only two in number—'England and Spain,' written when the author was fourteen; and 'Wallace's Invocation to Bruce,' a prize poem, which carried off fifty pounds from a host of competitors, so numerous as to require a month to read their lucubrations, one being as long as 'Paradise Lost.' The main feature of the opening volume is the Life, by the poet's sister, the character of which will be understood when we say that it bears a family likeness to the poems—graceful, feminine, and full of feeling, with as much impartiality as could be looked for in so near a relation."

DUBLIN MONITOR.

"Few writers of the present age are more deserving of permanent record than Mrs. Hemans, and, from the peculiar character of her genius, the individuality of her poetic temperament—for she stood alone and apart from all dead and living authorities in her chivalrous, deep-toned inspiration—she would require the aid of a biographer more akin to her in genius, more gifted with the analytic skill of developing the deep and hidden sources of her power. Her sister has accomplished all that tenderness and affection could; every page bears the impress of the pure and exalted enthusiasm with which she very naturally regarded the character and fame of one so worthy of esteem and admiration as her gifted sister. But the whole memoir resembles more the tender lamentation poured out in the depth of distress, when the object of our love and solicitude has taken the wings of the morning and flown to a happier world, than the combination of calm judgment and judicious praise which the true biographer should employ. The relation in which she stood to Mrs. Hemans, the companion of her childhood—the witness of the bud, the flower, and more stately tree—enabled her to observe those slight and transient touches of character, the thousand little hues of thought and sentiment on which, much more than on more glaring and prominent characteristics, our knowledge of the human mind and human conduct is founded."

UNITED SERVICE GAZETTE.

"We have here the first volume of a new and elegant edition of the works of Mrs. Hemans, comprising a very graceful and judicious memoir of that distinguished poetess, from the pen of a lady every way qualified to do justice to the subject. Always excepting Southey's admirable 'Life of Cowper,' and the preface to the new edition of the works of Crabbe, by his son, we hardly know a more discreet or interesting piece of biography. It has been too frequently the fate of genius to be sacrificed, living or dead, to the vanity and folly of pretended friends, who, in their attempt to blazon forth to the world their intimacy with the departed object of their affected reverence, are apt to forget the price at which their self-exaltation is likely to be purchased."

Volume III. will be published on the 1st of August.

WILLIAM BLACKWOOD AND SONS, EDINBURGH; THOMAS CADELL, LONDON; AND JOHN CUMMING, DUBLIN.

PUBLISHER IN ORDINARY TO HER MAJESTY.**

REVIEW OF NEW BOOKS.

Travels in South-Eastern Asia, embracing Hindustan, Malaya, Siam, and China; with Notices of Numerous Missionary Stations, and a full Account of the Burman Empire.
By the Rev. Howard Malcom, of Boston, U.S. 2 vols. 12mo. London, 1839. Tilt.

THE missionary efforts of America in the Eastern seas have been most zealous, and, in many parts, attended by the best effects. The present work is a good sample of their spirit: Intense piety and unwearied perseverance, unattended by bigotry to impede the one, or fanaticism to mar the usefulness of the other. Thousands of tracts are distributed; native education is earnestly followed out at various stations; some converts to Christianity are made; and the Gospel is publicly taught in the language of the countries. It is true that the results are yet imperfect and unsatisfactory. Tracts are destroyed or disregarded—education has made but feeble progress—converts are few and doubtful—and the truths of the Scriptures scantily propagated, and hardly understood: but the seed is sowing, and even within the brief space of three or four years it has partially taken root, and blossomed, and borne fruit. May we not hope that, with the blessing of Providence, these endeavours will be speedily and extensively crowned with the entire success they deserve; and that civilisation and improvement will advance hand-in-hand with the moral and divine code of the Christian faith, till these vast regions rejoice in order and in safety, in prosperity and in happiness, in the full enjoyment of the lavish bounties which this earth so profusely offers to human cultivation in these luxuriant climes, and the consoling prospect of eternal life as the reward of virtue in this our world of trial?

With regard to the author, whose volumes have drawn forth these short introductory remarks, he enjoyed great advantages for obtaining information about the parts he visited. Sent from Boston, U.S., to inspect the condition of the Oriental missions, and devise the best means for combining and continuing their labours with advantage to the good cause; he appears to us to have sought intelligence in the most rational manner, and to have weighed it with care and impartiality, so that his statements may be received as the most correct within the reach of a white man to obtain. Though enthusiastic in his pursuits, he is not misled by his feelings; and we think we may rely, with perfect confidence, on the many new and interesting matters which he communicates. A nice little map is also a suitable companion to these travels; and they open fervently:—

“How cordial (says Mr. Malcom) and comprehensive are the sympathies of true religion! Who that saw the Louvre, with her eleven ordained ministers, about to spread her canvass, could fail to contrast the scene with ordinary shipping operations? Over all the wharf is one dense mass of grave and silent spectators, while the decks and rigging of the adjacent ships are filled with younger, but not less intent observers. No sound interrupts the ascending prayer. The full harmony of a thousand voices wafts to heaven the touching hymn. Count-

less hands, thrust toward the narrow passway, seek the last token of recognition. Even the aged, unaccustomed to tears, weep, not from bitterness, but in exuberance of love. But here are none of the customary inducements to convene a crowd. A ship sailing with passengers is no novelty. One of the number was, indeed, the pastor of a large and most affectionate congregation; but with the others, in general, the multitude had no acquaintance. Personal attachments, therefore, had not assembled the people. There was, in fact, nothing in the scene which could call forth a general interest, but its religious character. The regular packet, crowded with passengers, leaves our shores, while only here and there a group of personal friends look on with interest. The merchantman unfurls his sails, but his destination and objects are not regarded. But the missionary!—he awakens the sympathy of every believer. Stranger though he be, all press to grasp his hand, and, when gone, all intercede for him with God. Even denominational preferences are forgotten, and every sect mingles in the throng, exulting in a common joy.”

From September 23d, 1835, to the 21st of the ensuing February, these worthy men ploughed the deep; and, after touching at Calcutta, arrived at Amherst and Maulmain in Burmah, on the opposite coast of the Bay of Bengal. Thence Mr. Malcom coasted southward, in a small vessel, to Tavoy and Mergui, employed in the works of his mission. Of Tavoy he tells us:—

“The province, exclusive of the city, contains 4768 houses, and 25,143 inhabitants; or rather over five to a house. There are from thirty to forty criminal convictions per annum. The revenue is more than equivalent to the expenditure of the company in keeping up its military and civil establishments, which is said not to be the case with any other of these provinces. The number of priests is estimated at about four hundred. Of nuns there are about fifty; of whom all I saw were beyond middle life, and generally wore the aspect of mendicants. The dialect of Tavoy is a sort of obsolete Burman, scarcely intelligible to those who speak the pure language; but no difference exists in writing.”

Of its missionary *status* we learn:—

“Public worship in the Burman language is held every Sunday morning, in a convenient chapel of ample dimensions, at which the children of all the day-schools, with their teachers, are required to be present. Few of the other heathen citizens attend; seldom more than two or three; and as there are but five native Christians in Tavoy, the congregation is very small. Some that were baptised here have gone to other places. Worship is also held every evening at the house of one of the missionaries, at which the native Christians and pupils in the boarding-schools attend. Seven soldiers have been baptised, but all are now gone; and only a gentleman in the medical service, and the missionaries, form at this time the Baptist communion in Tavoy. In no part of our field is help more wanted than for the Burman department of the Tavoy mission.”

Of Mergui we are told:—

“Mergui has been put down as one of our stations, but it was only occupied by a native assistant for six months. We have but one professed Christian in the place, and that a woman. Mr. Mason has been thrice through the town, on his way to the Karens up the Tenasserim; and the efforts he and his assistants have made have met encouraging results. * * * The fact, too, that Siamese Shyans live here, most of whom, the men at least, speak Burman; and that on the Tenasserim, and its tributary streams, and on the coast below Mergui, they have villages, one containing eight hundred souls,—urges us to make early efforts here. If any of these Shyans should receive Christ (and surely we may hope and believe they would), they would be invaluable in carrying the gospel to their countrymen, who inhabit the hills and mountains from the Tenasserim to Bangkok. Tracts, &c. in this language, can at once be had from Mr. Jones, and all things seem to be ready. The intercourse between Burmah and Siam, so far as the natives of the two countries are concerned, is perfectly unrestrained, though no white man is allowed to pass the frontier.”

And generally we are assured that:—

“Though there is not the slightest restraint upon idolatry in these provinces, the people are certainly less devoted to their superstition than before the war. It is scarcely possible to discover, from the appearance of the streets, when the worship days occur; and the number of priests is much less than it would be among an equal population in Burmah Proper. The people are evidently ripening for some change. There is, therefore, eminent necessity for following up, with the utmost vigour, the means for extending Christianity.”

There ought to be, and must be, some substitute: for a picture of a native, in his present state of idolatry, is one that powerfully touches the heart. Mr. M. relates:—

“While walking among these distressing evidences of folly and misery, we often saw scenes like the following:—A poor man struggled up the back part of the mountain with a little child on his hip, less than three years old, plucking a few green twigs from the bushes as he passed. He went up to a great bell, suspended in the area, and, taking a deer's horn lying on the ground for the purpose, struck it twice or thrice. Then, reverently entering the image-house, he prostrated himself, and taught his little one to do the same, which it did so readily as to make it certain it was not its first attempt. He then prayed, with the palms of his hands placed together, and raised to his forehead, while the poor little babe lisped out some of the same words. At the conclusion, he walked up to the idol he had addressed, and laid before it, with great solemnity, his offering of green leaves, and, taking up the babe, descended the mountain.”

If this worship be sapped and taken away, it is the sacred duty of those who do so to take care that a better and purer faith be planted in its stead. At Maulmain:—

“The native church under Mr. Judson's care has more than a hundred members. Some

sixteen or eighteen are valuable assistants, of whom a part are generally employed at other stations. Such as are employed here meet Mr. Judson every morning at sunrise, and give an account of their labours during the previous day, often rehearsing the very conversations. An excellent opportunity is thus obtained for enlarging and rectifying their views, and giving them helpful ideas in particular cases. On Sunday, the congregation consists of but few beside the church members. If any attend three or four Sundays, they are pronounced disciples by their friends, and indeed generally become so."

We shall here close our extracts from the first portion of the work, relating to Burmah, as far as the missionary affairs are concerned; and proceed to a few notices of the people, their habits, and condition. Here are *comforts*!—

"Aside from the danger of navigating this side of the bay of Bengal (except from September to March, when the weather is exceedingly fine), the inconveniences are not small, from the bad construction and management of the vessels employed, and the annoying insects, &c., with which they abound. My little cutter is superior in all those respects to the Burman vessels, which I expect generally to sail in from place to place. I can stand up in the cabin, while in those one can only sit, and that on the floor. I have a little quarter-deck, which they know nothing of; and we have an iron anchor, while theirs is but a piece of wood, shaped like a fish-hook. On the score of insects, too, I am informed that my condition is far better. In the latter point, however, I can by no means boast. Hundreds of ants, great and small, black and red, move in endless files every where. Cockroaches, flying and creeping, spotted, striped, and plain, walk over me and about me all night; but, through mercy, they do not bite, and are, withal, quite shy when there is a light burning, and so do not interrupt me when engaged. I now and then kill a forward fellow; but it is in vain to think of abating the nuisance, for their 'name is Legion.' I have nice sugar-cane laid in a corner for the ants, to keep them away; but some of them are blood-thirsty, and bite me with all zeal. I sometimes watch a bold fellow, as he runs over my hand; and, when he finds a suitable spot, he raises himself perpendicular, and digs into me, kicking and struggling, as if he would go through the skin. The spiders I kill without mercy; and busy enough they kept me the first day or two. Some of them have bodies as big as the joint of one's thumb, and occupy, as they stand, a space as large as the top of a coffee-cup. Nice nibble my clothes at night. I have seen but two or three centipedes, and succeeded in killing them; but there are, doubtless, more on board. But the mosquitoes! They are a torment day and night. I am comforted with the assurance that strangers suffer most with them, and hope they will not 'make a stranger of me' much longer."

The Burman new year is observed with curious ceremonies:—

"The festivities which usher in the new year (commencing at the April new moon) have, for several days past, kept the town excited. Before every Burman house is erected a slight bamboo palisade, six or eight feet long, decorated very tastefully with young palm-trees, and pots of water, filled with various beautiful blossoms. The moistened streets send up an enlivening freshness, which, with the odours of the flowers, makes the street like a charming avenue in a garden. The absurd,

yet amusing, ceremony to which these are preparations seems peculiar to Burmans. It is a general war of water. Every one is at liberty to wet his neighbour, but the compliment is chiefly paid by women to men, and men to women; the children taking the principal share of the business into their hands. I have just been riding along the principal streets to witness the scene; but no one offered to compliment me, or other foreigners, with a bowl of water. They know that foreigners, whose raiment is not so easily changed, do not relish the sport; though sometimes, out of ill-timed complaisance, they submit to it. Almost universally the people take it pleasantly; but occasionally I saw little fellows chased and overthrown in the dirt, who played off on men. It certainly requires some command of temper, to shew entire nonchalance when the children project a forcible stream from large bamboo syringes directly into the eyes and ears, creeping up slyly for the purpose, and running off with exultation. Not a native is to be seen with dry clothes; but 'holyday clothes' on this occasion are their poorest. No one can assign any origin or signification to this custom. It seems as if it must have originated in some notions of purification from the sins of the old, and entering cleansed upon the new year; but Buddhists have no idea of the remission of sins, in any way. Their only hope is to balance them with merit."

The caves near Maulmain are of splendid construction. Mr. M. says:—

"The last one we visited is on the Salwen, about fifteen or twenty miles above Maulmain. The entrance is at the bottom of a perpendicular but uneven face of the mountain, inclosed in a strong brick wall, which forms a large vestibule. The entrance to this inclosure is by a path, winding along the foot of the mountain; and nothing remarkable strikes the eye till one passes the gate, where the attention is at once powerfully arrested. Not only is the space within the wall filled with images of Gaudama* of every size, but the whole face of the mountain, to the height of eighty or ninety feet, is covered with them. On every jutting crag stands some marble image, covered with gold, and spreading its uncouth proportions to the setting sun. Every recess is converted into shrines for others. The smooth surfaces are covered by small flat images of burnt clay, and set in stucco. Of these last there are literally thousands. In some places they have fallen off, with the plaster in which they were set, and left spots of naked rock, against which bees have built their hives undisturbed. Nowhere in the country have I seen such a display of wealth, ingenuity, and industry. But imposing as is this spectacle, it shrinks to insignificance, compared to the scene which opens on entering the cavern itself. It is of vast size, chiefly in one apartment, which needs no human art to render it sublime. The eye is confused, and the heart appalled, at the prodigious exhibition of infatuation and folly. Every where, on the floor, overhead, on the jutting points, and on the stalactite festoons of the roof, are crowded together images of Gaudama—the offerings of successive ages. Some are perfectly gilded; others incrustured with calcareous matter; some fallen, yet sound;

* At Umerapoora, "Gaudama wears a form not given to him elsewhere, I believe, except in paintings, viz. that of a cock. The legend is, that when he was in that form of existence, he was king of all fowls, and, passing that place, he scratched there! Hence the sanctity of the spot, and hence the noble structure which distinguish it! The face of the stone cocks which ornament the niches, somewhat human, the bill being brought up to his eyes, like a huge hooked nose."

others mouldered; others just erected. Some of these are of stupendous size; some not larger than one's finger; and some of all the intermediate sizes; marble, stone, wood, brick, and clay. Some, even of marble, are so time-worn, though sheltered, of course, from changes of temperature, that the face and fingers are obliterated. In some dark recesses, bats were heard, and seemed numerous, but could not be seen. Here and there are models of temples, kyounga, &c., some not larger than a half bushel, and some ten or fifteen feet square, absolutely filled with small idols, heaped promiscuously one upon another. As we followed the paths which wound among the groups of figures and models, every new aspect of the cave presented new multitudes of images. A ship of five hundred tons could not carry away the half of them.

"English influence (we rejoice to hear), in a variety of ways, improves the temporal condition of these provinces. It has abolished those border-wars which kept this people and their neighbours continually wretched. None but those familiar with the country can describe the evils produced by a Burman war. The troops are drawn from the remotest provinces; and, as they march, labourers, stores, money, boats, and cattle, are taken without compensation. They have no tents, no pay, no regular rations, and suffer every sort of hardship. Every where, as they go, the people fly into the jungle; and such property as cannot be carried away is plundered without restraint. Poverty and distress are thus spread over the whole kingdom, even by a petty border conflict. Of course, at the seat of war, every evil is magnified a hundred-fold. The mode of raising troops is the worst possible. Each chief is required to furnish so many, and is sure to get rich by the operation. He calls first upon those who have money, and suffers them to buy themselves off, taking finally only those who have no money. So, if he want boats, the richer boatmen pay a bribe and get off, and the poor must go. So with carts, and, in fact, every thing. The suppression of war cuts off a large portion of the chances for these extortions. In the Tenasserim provinces, various improvements are perceptible. Coin is getting introduced instead of masses of lead and silver; manufactures are improving; implements of improved construction are used; justice is better administered; life is secure; property is sacred; religion is free; taxes, though heavy, are more equitably imposed; and courts of justice are pure, generally. Formerly, men were deterred from gathering round them comforts superior to their neighbours, or building better houses, for fear of exactions. Now, being secure in their earnings, the newly built houses are much improved in size, materials, and workmanship. There are none of those traps and trammels which embarrass courts in England and America. The presiding officer in each province, Amherst, Tavoy, and Mergui, sits as magistrate on certain days every week; and before him every citizen, male or female, without the intervention of lawyers, may plead his cause, and have immediate redress. Every where, in British Burmah, the people praise English justice; but they are not yet reconciled to regular taxation. Though the Burman government, or its oppressive agents, took from them more than they pay now, yet it was occasional; consisted chiefly in labour, and they were not under the necessity of saving any thing against a certain day—a matter to which they have been altogether unaccustomed."

From this place Mr. M. embarked for Rangoon, visited Pegu, Prome, and Ava. Passing up the Irrawaddy he says:—

"The boatmen having intimated, some days ago, that cattle were very plenty here, and that I might get a calf cheap, I inquired if they wanted veal themselves. They rather reluctantly confessed their desire, knowing me to be aware of their religious scruples; but I readily agreed that, if they would procure me a calf, my Madras servant should kill it, so that they might eat without compunction. Accordingly, at Nong-oo, the penin bought a fat yearling for a rupee and a half (nearly 3s. sterling.) But as the late owner was leading it to the river, half a dozen of the neighbours set up a clamour, because he had sold his beast to be killed; a crowd gathered, the penin slunk away, and the disappointed owner led back his heifer! The proper way to get meat is to shoot any fat animal you see, then pay its owner for the damage, and bear off your prize. The owner in such case escapes blame, and is regarded to get the money."

At Ava we are informed:—

"The Sur-ra-wa prince, to whom Mr. Kincaid next introduced me, received me with the greatest urbanity. He is the only full brother of the present king, a few years younger, and is more likely to succeed him than the proper heir-apparent." He is said exactly to resemble the king, and certainly there could scarcely be a more intelligent and manly countenance. The Alompra forehead, which distinguishes this family, slopes backward somewhat too rapidly for a good head, but is high, and has great breadth. When speaking, his countenance is lighted up with great animation. Though less literary than his uncle, the Mekara prince, he is considered more talented, and to possess more general information. He spoke in high terms of our country, and acknowledged the impolicy of the restrictions on exports, and other impediments at Rangoon. In remarking on various countries and their institutions, he shewed not only an enlightened, but a reflective and strong mind. Respecting the tribes between here and China, he gave me much valuable information. The object of my visit to the 'golden city' being explained to him, I expressed much satisfaction, in finding our missionaries here fully protected and enjoying all the rights of citizenship. He immediately drew a comparison between the liberal usages of this country, in receiving and protecting all foreigners, and the policy of China, in excluding them; invited me to place teachers in the adjacent cities; and recommended me to travel in the interior, and see more of the country. During the interview, his lady was introduced, with a lovely infant, two or three years old; and nothing occurred to indicate that odious haughtiness which so generally attaches to men of his rank in the East. On taking leave, he invited us to visit his garden next day, which we did; for I deem a garden a test of civilisation. We found a large space, perhaps an acre, well laid out, with raised brick foot-paths, plastered, and resembling stone. Marble tanks, artificial ponds, with gold and crimson fish, numerous watercourses and reservoirs, and several men engaged in drawing water from wells, shewed how much attention to irrigation is necessary to a garden at Ava. He had the peach, apple, coffee, fig, and many other foreign fruits, beside the varieties of luscious ones which are native. In an adjacent encl-

o "He succeeded the throne, on the death of his father, in 1857."

sure he had wild animals and some singular birds, perfectly gentle, and going at large. On the whole, it was a tasteful and pleasing spot. Men of rank, in this city, generally have such gardens, on which they bestow great expense. I visited one or two others, which had handsome *zayats* in them, where the owner reposed sometimes as in a summerhouse, or received his intimate friends. Not to multiply accounts of visits to great men, it will be enough to remark that I found all to whom I was introduced intelligent and affable. Having read of them as gorgeously arrayed on days of state ceremony, I was disappointed to find them dressed precisely like other men, i. e. with waist-cloth and turban only. These, however, were of the best materials. If it was the cool of the day, they wore also the *eng-yi*, or mullin coat. Their dwellings now are temporary buildings, outside of the city wall, and are, in fact, mere shanties. By what is, perhaps, a necessary precaution, in such a government, when the king goes out of the city, all the nobles must go out also, and stay out till he returns. He is now residing at his water-palace, so called—a collection of wooden houses, one story high, between the city wall and the water. During my whole visit here, Colonel Burney was in the habit of sending to me the distinguished persons who called upon him, who could give me information, from their own knowledge, of the tribes between this city and China. Among others was the lately famous Duhá Gám, who rules the largest part of the Singphoo. He came with a *sera-dau-gyee*, or chief secretary, and rode a horse richly caparisoned. The skirts of the saddle were circular, a yard in diameter, and completely gilded. In other respects, he had no marks of a prince but his intelligence. Among other inquiries, I asked if he would protect Christian teachers, and suffer them to give books, if we sent some to his tribe. He assured me that he would, and that all quiet foreigners were secure in any part of his dominions. Besides a small present of penknife, scissors, &c., he accepted a copy of the New Testament, an assortment of tracts, and a map of the world, lately lithographed by the missionaries, with the names in the Burman language. Mr. Kincaid endeavoured to impress on his mind some leading truths of religion.

* * The present aspect of the station is full of encouragement. Mr. Kincaid is completely at home in the language, and the native assistants, among whom is Ko Shoon again for a season, are laboriously engaged. Besides these, Ko Gwa, the deacon, a wise and valuable old man, is employed much of his time very usefully in private conversation through the city. He had charge of the late king's bearers, amounting to several hundred men, and possesses not only a large acquaintance, but some influence. Two or three of the other members are of very respectable worldly standing, and three young men give promise of becoming useful in the ministry. They are studying English, geography, &c. at the mission-house, under Mrs. Simmons, and two of them will probably join the school at Tavoy. All the disciples except two, who reside forty miles off, and one who is often kept away in attendance upon his sister, a maid of honour in the palace, are regularly at worship every Sunday, and attend the concert of prayer and such other meetings as may be appointed. Ava is a great centre, to which persons resort from every part of Burmah and its tributary states. Many of these come to the mission for books; not so much to hear about the 'new religion,' as to

see white foreigners, especially ladies. Except Mrs. Judson (who, of course, was little seen abroad during the war, and, as the governor's widow stated, part of the time wore the full Burman costume, to avoid molestation), no white female has ever been seen here, till the establishment of the British Residency. There they dare not go to satisfy their curiosity, and they flock to the mission-house, for the ostensible purpose of obtaining a tract. During my stay, there were always some in the house, often a complete throng, staring at every thing, feeling every thing, wondering at every thing. Often, when their attention is secured for a moment to divine truth, they begin to feel your hands, or examine the intricacies of your raiment, or the joints of your table, and you perceive your words are lost upon them. Sometimes they seem absorbed with wonder at the tract you have given them, and, in trying to find out how it is put together, pull it to pieces before your eyes. Many have heard that Mr. Kincaid has globes and an orrery, and come avowedly to see those. Our mode of eating is an especial marvel; and we generally have many spectators in the room or at the door. Such facts, together with those I have already mentioned in relation to tracts, must be remembered by the friends of missions at home, lest they make very erroneous inferences from the naked statements of missionary journals. It has been inferred from these, that persons have come hundreds of miles for a tract, or to hear of Christ, from its being stated, that a person from such or such a distant point came for tracts, &c.; whereas the person, being at the station on other business, came as a matter of curiosity. It has been inferred, too, that a general spirit of inquiry has been excited throughout the empire. Alas! the very contrary is the fact. In general, tracts are received more cordially at first than ever afterward; and often, on visiting a village a second or third time, few will accept a tract at all. A writer in America has stated that 'whole villages have been converted unto God.' There has been no such event. Two Christian villages have been formed by collecting converted Karens together, and others may yet be formed; but, as a general measure, it is deemed unsafe and undesirable. The great stumbling-block with Burmans, as with those to whom the apostles preached, is 'Christ crucified.' They cannot get the idea of an eternal God; and that Christ was a man seems to put him on a footing with Gaudama. They bring up the fact of his being 'born of a virgin' just as infidels do. Thus that glorious doctrine, which, to such of them as come to feel the power and guilt of sin, is the sweet theme that fills their hearts with peace, is, to the multitude, the 'hard saying' which they cannot bear. Yet there are some prominent encouragements at this station. That tracts and books may be distributed from hence to the remotest parts of the empire, is a very important circumstance. That they come from the imperial city, gives them augmented influence. That they are frequently taken by head-men and principal citizens, gives more. That government is fully aware of our missionary efforts, having had Mr. Kincaid several times before them, gives the people an impression that his conduct now is at least winked at. It is ascertained, also, that some thirty or forty persons in the city are so entirely convinced of the truth of Christianity, as to have forsaken the forms of Buddhism, and worship in secret, as they affirm, the eternal God. They dare not come to public worship, and some of them not even to the

missionary; but they receive gladly the visits of the native assistants; and, we may hope, will yet become decided Christians."

Returning to Rangoon, Mr. Malcom gives us some account of Arracan, now ceded to Britain, and of its towns, Chittagong, Akyah, Kyook Phyo, Ramree, &c. &c.

"The Mug population is usually given in books at 300,000, but, by the last official returns, is only 237,000. The country is divided into four districts, viz. Akyab, Ramree, Sadoway, and Aeng; of which Akyab has 108,166 inhabitants; Ramree, 68,934; Sadoway, 22,976; and Aeng, 11,751. In addition to these, there are hill tribes, not regularly numbered, amounting to about 25,000.

"Arracan was once famous for cocoa-nuts, but in former wars they were nearly exterminated. There are now scarcely any trees of this sort in the province, and quantities are imported. The fruits and vegetables are much the same as in Burmah, but in general less abundant, and of inferior quality. Oranges (called by the natives sweet limes) are very plenty[ful] and excellent. The proper lemon, I was told, is not found, but there are sour limes as large as ostrich-eggs, with skin as thick as that of the shattuck. In some places there are mangoes, and the jack is pretty common. The wild fig is excellent. Other fruits are much the same as in Burmah, but scarcer and of inferior quality. The annual fall of rain is about two hundred inches. The seasons are the same as those of Pegu."

We end with a remarkable passage, descriptive of the adjacent shores:—

"The region between Kyook Phyo and Akyah is an extensive and yet unexplored archipelago of small hilly islands, for the most part uninhabited. In winding among these, instead of putting out to sea, the scenery, though wild, is often very fine—

'An orient panorama, glowing, grand,
Strange to the eye of Poesy; vast depths
Of jungle shade; the wild immensity
Of forests, rank with plenitude, where trees
Foreign to song display their mighty forms,
And clothe themselves with all the pomp of blossom.'
Lytton.

"The shores for the most part are coral. Specimens of great size and beauty, white, yellow, red, and black, are gathered here. To walk on 'coral strands' was not less new to me than to see beautiful shells, such as are on mantel-pieces at home, moving over the moist sand, in every direction, each borne by its little tenant. The study of conchology has long seemed to me to bear about the same relation to the animal kingdom, that the study of the coats of unknown races of men would be to the human family. But to see the creatures in their robes; to watch them as they sought their food, or fled to their holes at my approach; to mark what they ate, how they made their holes, and how, when overtaken, they drew all in, and seemed dead; how they moved, and how they saw, &c., was delightful. I felt myself gazing at a new page in Nature's vast volume. I rejoiced that my God is so wise, so kind, so great, and that one day I should read his works 'in fairer worlds on high.' Some of these large shells resembled large snails, but of beautiful colours; others, still larger, and more elegant, were of the shape used for snuff-boxes; others were spiral cones, five or six inches diameter at the base. Each had claws, which it put forth on each side, and walked as a tortoise, but much faster. When alarmed, the head and claws were drawn inward so far as to make the shell seem empty. As my ignorance of conchology prevented my distinguish-

ing common from rare specimens, I refrained from encumbering my luggage with either shells or coral."

The Pilgrim of Beauty, and other Poems. By Samuel Mullen. 8vo. pp. 134. London, 1839. Clark.

THIS little volume possesses more than ordinary merit. There is a feeling and a freshness in some of the pages, that far surpass the generality of similar publications. Thoughts that, without imitation, remind us of Shelley; for the author has the same yearning for the spiritual and beautiful. Many of the verses, also, are full of harmony; words that move smoothly and sweetly along, and carry away the reader in delightful reverie; and the mind glides peacefully from page to page, pleased with the passing imagery, as if contemplating the scenery while floating on the bosom of some tranquil river. The smaller poems are not so much to our taste, although many of them are fraught with deep feeling, and here and there we stumble upon a stanza that is truly beautiful. We select the following from the opening poem:—

"The ethereal plain was spread before my view,
In one wide scene of hallow'd beauty bright,
Where flowers of every form and every hue
Displayed their glories to the eager sight,
And fill'd each sense with exquisite delight;
And plants and shrubs all odorous and divine
Were growing there, beneath that lucid light
In which things lovely still more lovely shine,
And full perfection breathes, complete in each design.

No stately dome, no gorgeous minaret,
No solemn arch, no chisel'd pillar shone,
No lofty hall in sculptured stiffness set,
No palace there of ivory or stone;
But overhead a canopy was thrown,
Of pure, divine, unmitigated light,
In whose mild radiance evermore was shewn
The holy image of that form—how bright!
The centre of desire—the cause, the end of sight.
Majestic trees—whose verdant branches hung
Long graceful shadows o'er the flowery green—
Festoon'd with creepers, whose thin tendrils clung
All lovingly around the leafy scene,
As if with their fair forms they sought to screen
Their kind supporters from the bitter breeze,—
Like some fond wife, who thrusts herself between
The coming danger which her quick eye sees,
And him whom, more than self, her heart delights to please.

A river through the living landscape roll'd,
With graceful sweeps meandering to and fro,
Whose sparkling waters glow'd like burnish'd gold,
And made low music with their rippling flow.
Clear was the wave; the golden sands below
With precious stones were studded, sparkling bright,
That consecrations evermore did throw,
In flashing rays of many-coloured light,
Which, mellow'd by the wave, flung gladness o'er the sight."

Ianthe. By Nugent Taylor. 8vo. pp. 24. London, 1839. Saunders and Otley.

THE author has evidently modelled himself on Byron, and with but little success. It requires something more than dashes, breaks in the lines, and irregular accents, to produce the "Lara's," and "Glauc's," of the most off-handed of poets. *Ianthe* is not altogether devoid of pretty thoughts; but they are so huddled together, so carelessly expressed, that it often needs great attention to discover the author's meaning. Take the following as a specimen:—

"Amid the warmth of beauty's charms,
That balm'd him to hope's fearless rest—
Dreaming that earth and love were heaven.

And have they not been heaven to me?
O yes! when all life's pains are o'er,
And I have pass'd from care to thee,
My young heart's idol, memory's store
Of thought shall linger warm in bliss
Upon the dew of love's fond kiss.
Shall linger, as the last sad tone
Of music on the zephyr'd stream,
When fancy rays with hope alone
The poet in his mental dream.

O Love, thou art my rapture's theme!
Through wroag, and sorrow, pain, and woe,
The sunny morn that lights the beam
Which warms the mind with passion's glow,
Sweeping with fond and sweet delight
The shadow from my spirit's night."

"That balm'd him to hope's fearless rest,"

and

"Music on the zephyr'd stream,"

are conceits rather too quaint for the present age; indeed, the whole of the poem seems to have been too hastily written to need much criticism. If authors will throw off their productions so hurriedly and carelessly, they must rest content with the brief remarks we make upon their works: we cannot waste hours in criticising every trifle, although we always look at quality more than quantity.

A Concise Account of the several Foreign Orders of Knighthood, and other Marks of Honourable Distinction, especially of such as have been conferred upon British Subjects. Together with the Names and Achievements of those Gallant Men who have been presented with Honorary Swords, or Plates, by the Patriotic Fund Institution. By Nicholas Carlisle, Esquire. Knight of Guelphic, Iron Crown, Dannebrog, and many other Orders; Secretary of the Antiquaries' Society of London, &c. &c. &c. Large 8vo. pp. 582. London, 1839. Hearne.

THE boast of heraldry and the toils of antiquarianism, notwithstanding their importance in many respects, have in them inherent principles of gossipry, from the exhibition of which it is impossible to dissociate the discussion of any topic within their bounds. Neither has our worthy author refrained from indulgence in this line, nor from that of a harmless vanity in parading the numerous marks of distinction which have been bestowed upon him in the course of a long and irreproachable life employed in literary and antiquarian pursuits. The man whom Hanover, Austria, Denmark, have delighted to deck with stars or ribands—whom Oxford, London, Dublin, Copenhagen, Stockholm, Iceland, Mitau, Philadelphia, Palermo, Rome, and even Newcastle-upon-Tyne, have elected into various of their learned and scientific institutions—a gentleman besides of her majesty's honourable privy chamber, which must be next to a Knight of the Garter—the man, we say, covered, as it were, all over with such trophies and decorations, has a right to parade them a little in his title-page, and show that it is truly and literally a *Title-page* indeed. What would a merchant give to have so many Orders from Germany, from the United States, from the Baltic, from the Mediterranean, from the Adriatic, from the Liffey, the Tiber, the Hudson, the Thames, and the Tyne? Would he not hand up his *Order-Book*, as Mr. Carlisle has done, with pride and exultation? Human nature could do no less: the heart must be of the same stuff as the imperial Iron Crown, that could resist the soft impeachment swelling in the bosom to tell of the high destinies which had rewarded so glorious a career.

Of the work itself we may state, that it gives an account of the Austrian Orders, the Golden Fleece, Maria Theresa, &c.; the Baden Fidelity, &c.; Bavarian St. Hubert, St. George, &c.; Belgium Leopold, Iron Cross, &c.; Brunswick, Henry the Lion, &c.; Danish, Elephant, &c.; French, Holy Ghost, St. Michael, St. Louis, &c.; Genoa, St. George; Greece, The Redeemer, &c.; Hanover, the Guelphic, &c.; Hesse Cassel, Golden Lion; Darmstadt, Louis; Netherlands, Wil-

helm, &c.; Turkish, Crescent, &c.; Persian, Lion and Sun, &c.; Polish, White Eagle, &c.; Portuguese, Christ, Tower and Sword, &c.; Prussian, Generosity, Black Eagle, &c.; Romish, Golden Spur, &c.; Russian, St. Andrew, St. Catherine, &c.; Sardinian, Annunciation, &c.; Savoy, St. Maurice, &c.; Saxon, St. Henry, &c.; Sicilian, St. Januarius, &c.; Spanish, Golden Fleece, Charles the Third, &c.; Swedish, Seraphine, Sword, &c.; Tuscan, St. Joseph; Wurtemberg, Crown, &c.; the British Orders; and some of Africa, South America, and other parts.

In a work travelling over so large an extent, and embracing so many subjects, there must of necessity be many omissions and imperfections. For some of these the author offers an apology; others, we think, might have been avoided by greater research and care. Mr. Townsend's previous publication is not liberally acknowledged as it ought to have been, and thus hostility provoked where candour might have silenced critical censure. "The Gentleman's Magazine," a good authority in such matters, points out these things; and our own opinion confirms the judgment. Another edition would enable the writer to remedy and correct what is wrong. In the meantime we select a portion of his introduction, with which we agree:—

"Foreign governments have studied to reward merit of every kind.—To the military are assigned special orders, according to their rank and service; to the civilians, are decorations and medals, adapted to every occasion; and, with a noble and wise policy, they are open to persons of all religious tenets, and neither interest, rank, birth, nor patronage, have any influence in the distribution of them,—but true merit is alone the recommendation to such distinction. Why, then, is Great Britain so sparing in civil honours? Why is this illustrious empire the only one in Europe, where there is no such dignified and generous mode of publicly distinguishing superior acquirements in science, in learning, and in liberal art? If the laws of the country are found to be unjust or imperfect, a remedy is provided by the senate. If, by some oversight, extraordinary knowledge, rare talents, and exemplary industry, be treated with indifference, why permit the reproach to continue? Is any encouragement of that spirit of emulation, which animates the civilian in his highly important but peaceful labours, to be found in the preceding regulations? If not, then let so injurious a partiality no longer exercise its chilling influence; let every class of the community be incited by the hope of national honours, to direct their best energies for the benefit and glory of a country capable and willing to reward most bountifully and gratefully civil as well as military services. I may safely predict, that the institution of a civil order would obtain the unanimous approbation of the British people, and that every national expression of gratitude would be offered at the foot of the throne for such an act of wise and liberal policy,—an act the more auspicious, as gracefully marking the commencement of the reign of a young and lovely queen."

We are aware that there is much difference of sentiment upon this point; but we cannot see if such distinctions are a stimulus to, and reward of, warlike services, why they should not produce the same effects upon men engaged in the arts of peace. Gulliver's three coloured silk threads (red, blue, and green) are very well to laugh at; but so long as there are human passions, ambition, the love of distinction, and

a just pride in believing that commendable actions are duly appreciated, so long will medals, crosses, stars, and bits of riband, be valued by the best and ablest of mankind. As we have alluded to the African order of the Palm and Alligator, we conclude by subjoining Mr. Carlisle's history of it, though in a less grave volume we might have fancied it a hoax. He says:—

"I feel a singular satisfaction in being able to record the institution of an order of knighthood by the independent kings and chiefs of the wild regions of Sudan, on the western coast of Africa, which bespeaks an advancement hitherto little known in the cultivation of the blessings of civilisation and humanity,—blessings which must greatly be increased and confirmed by the justice, protection, and philanthropy so wisely administered to them by Major (now Lieutenant-Colonel) Henry Dundas Campbell, late Lieutenant-Governor of the Colony of Sierra Leone, and its Dependencies."

In a letter from the kings and chiefs of Sudan, to his late majesty King William the Fourth, they beg to inform his majesty 'what Henry Dundas Campbell has done. He has given liberty to our country; for, before he came to the Timmanee country, the natives used to kill each other,—and sell and buy each other,—they committed all sorts of wickedness,—they disturbed all the country, so that there was no safe place for quiet people to cultivate. Nobody could travel, for they disturbed every place,—and these excesses were still committed, when the kings of Sudan met together, and sent to Henry Dundas Campbell, who came and made a treaty, and put a stop to the war, and they accepted his good regulations. They thought it better to deliver into his hands all the countries which he had governed more than twelve months. The kings came to Campbell, and went back, and said, 'We never saw any man like this Henry Dundas Campbell.'—All the nations were praying for him,—and those who heard them, said, 'It is true, for we never saw any one better than him among the kings.' All the nations of one accord said, 'We will obey and do whatever Campbell orders us to do. Campbell did not tell us any untruth,—he speaks the truth, like the Koran.' Campbell prays fervently,—he never mocks any one who prays, whether he be of his religion or not. Whoever goes to him, he receives kindly. He can laugh and play with a good man,—he cannot play with a bad one,—for every one likes him. He went to the fences, where the people were fighting,—he does not care for sickness, or pain,—nothing can hurt him. The kings are sure that God protects him, and that God has given him power to do good to their country. We, the people of Sudan, do not know how to thank Campbell, or reward him. We offered him gold,—he refused, saying, 'I came not here for gold.'—we never yet saw any Christian refuse to take gold, except this Campbell! The kings of Sudan begged him, saying, 'Accept this from us, to shew King William and his ministers how much the Africans loved Henry Dundas Campbell more than any other governor.' They have given him the order of the Palm and Alligator—none but kings can have that order. This country was under Campbell's command more than twelve months, during which time the people travelled over it in safety; the kings beg King William to let him wear that order, and to give some reward to Henry Dundas Campbell; and if the king does so, they will thank him as much as if he gave it to

them. O! King William, the name Abbas (sultan) which Campbell possesses, was given to him by us, that he might be honoured by all nations.' The deed, making Governor Campbell, Abbas, and granting him territory in the Timmanee country, is in the following words: 'All the kings and chiefs of the Timmanee country have met together to send for Henry Dundas Campbell. When they called him, he left his comfortable house and his soft bed, and came to them; he was not afraid of the suffocating and destructive climate; he came to the desert in the hot season, to the country which God had given him; when he arrived there, he found war raging terribly; but Campbell endeavoured to quiet them; he succeeded, and stopped the war immediately. Then all the natives were certain that Campbell was the cause of it, and that he came on purpose to make peace. When he arrived, he found no farms, but he began to teach them; when he did that, all the Sudan people wished to see him, which they did, and praised him greatly; and said, there is no one like him, he is very wise, he is just, and he was the means of doing us good. When the Sudan found him so affectionate and so merciful, they delivered up into his hands all their country, and they made oath to be faithful to him, and give him the country that he might restore it. They then made a treaty of peace, and put their country into his hands, after which nobody fought, but all collected together and made him Abbas; therefore, the Christians were jealous. The great name of Abbas is given to him and to all his children. The Sudan made the Abbas their leader and commander; we have made him our ruler, like the first Abbaside; we have given him the island of Royley, now called 'Ro Campbell,' and whatever portion of land he wishes to take for himself or for his children, for ever, until the end of the world.' The deed, making Governor Campbell Abbas of Sudan, and conferring upon him the order of the Palm and Alligator, is as follows:—"All the kings of Sudan have praised the Christian king, although you do not know it; but you must know for certain and be sure that we are the Timmanee, Mandingo, and Foulah nations, and Henry Dundas Campbell is our sultan. All the kings of these countries have given to him the order of the Palm and Alligator; and they have put into his charge all the country, to restore what was destroyed and ruined. All the kings of Sudan gathered together, and said, 'We have seen the chiefs, Captain Abbott, Royal African Corps, and Dr. Aitkin, who assisted our sultan in doing good to our country.' All the kings of the countries thank Captain Abbott and Dr. Aitkin, and ask God to bless them, for helping the sultan to settle our country. All the kings of Sudan have said, 'Well done!' The princes of other nations, called Dakta, Abkero, Kelora, Sager, will be gathered together of one accord, by his order, to help the sultan, for the good of our country. It is finished. All the Mussulmen who inhabit the whole of Sudan, with the inhabitants of Segou, have united together and said, 'We have made you sultan over us, like our former Abbas, who was the greatest sultan; there can be no sultan higher than Abbas, you are one of the Abbasides.' May God bless you, that you may live long, and keep your body in health; may the cold climates not injure you. O Lord, who art the lover of mankind, and whose throne is glorious, who hast life and death in thy power, and doest whatsoever thou wishest, bless him. We ask thee for the glory of thy countenance which

fills thy throne, and for the power which thou hast given to all thy creatures, and for the mercy which thou hast bestowed; there is no God besides thee. Bless him, O Lord; nourish him, O Lord God."

Bogotá in 1836-7. By J. Steuart. 12mo. pp. 313. London, 1839. Wiley and Putnam. THIS is the "narrative of an expedition to the capital of New Grenada, and a residence there of eleven months," and the author, in a desultory manner, gives us altogether the best account of the people, their manners, and many of the places he visited, that we have hitherto seen. It is to be observed, that though more remote and less frequented parts of South America have been particularly described, Bogotá and the Bogotans have, as far as we are aware, been passed over with comparatively little notice.

As Mr. Steuart does not venture upon scientific topics, and all his geography may rather be called topographical, we are not called upon to originate any mention of these matters; and may better illustrate the character of his volume by selecting a few passages which seem to us to possess the recommendations of novelty and variety. Thus having embarked in a vessel called a bonga, to pass through certain lakes, and ascend the Magdalena to Barranquilla, we learn that it is navigated by wretched blacks called bogas (*i.e.* river labourers), and that "these bogas, who are so far sunk below the grade of common humanity as to be unworthy of the name, make a great noise when poling the boats; and the most obscene and blasphemous expressions are uttered at every step they take. This, with the indecent exposure of their persons, may altogether rank them among fiends incarnate." This is finely contrasted by Nature in her scenery around. "Nothing (says Mr. S.) can much surpass the novel beauties of the scenery of this lake. The water transparent as the most polished mirror, and its surface undisturbed by a single ripple. Numerous mimic islands, or large clumps of dark green bushes, whose branches dip into the lake, are scattered in all directions. Large birds, of the most spotless white plumage, had settled on the boughs; at sight of which, joined to the perfect transparency of the sky above, and the sweet blandness of the morning air, filled as it was with delicious perfume, transported us back to the nursery tales of fairyland. All that was wanting to complete the illusion was to be shut out from the presence of those foul-mouthed beasts, the bogas, who were the only mar to the enjoyment of so lovely a scene."

Where all but the nature of man is divine.

On the second day, however, we have a different view, and it is thus journalised:—

"At daylight we entered just such another tangled passage as that we passed yesterday. This fully merits the appellation which it bears, namely, that of the 'Infernal Passage.' The 'patron' or skipper of the boat, however, did very wrong to attempt going through at this hour of the day. Had he but waited until the sun's power had been sufficiently felt, his prudence would have saved us from an hour and a half as severe purgatory as may well be conceived. For at the very moment the prow of the boat struck the thick beds of lilies, the air was perfectly filled with a species of small gnat, whose sting was instantaneous and excessively painful. There was no way of keeping them at bay. They attacked our very eyelids, lips, nostrils, and the interior of the

ears! All the flapping of hands and handkerchiefs was entirely without avail against the countless legions of such bloodthirsty and tormenting animals. As a last resource, we were obliged to roll ourselves completely up in sheets; yet within these folds, friendly as they were, we wellnigh endured all the horrors of suffocation, not daring to leave even space sufficient for respiration; for, the very moment the smallest aperture was made in our wrapper, in poured a stream of these malignant little wretches. Never should I speak disparagingly of moschetoos again after this acquaintance with the gnats that infest the Cienagas of Santa Marta. However, it was some little relief to the torment we suffered just to cast an occasional glance upon the whole company, thus busily employed; the quickness of their motions, their extravagant antics, their faces swollen with rage and bites, all joined to present a picture in which the painful and ridiculous were perfectly blended. The effects of these bites lasted much longer than those of the moschetoos, and we were obliged to use a wash made of laudanum and extract of lead in order to allay the constant irritation produced. We passed twelve or thirteen small lakes between Santa Marta and the Magdalena, all of which are connected by natural passages, and only two are as I have described them, the others having plenty of water, although in some it is very stagnant, and emits a fetid smell; the sun's rays being entirely excluded by the large, tall trees, which line very thickly either side. We saw, also, several large alligators sunning themselves, on the mud-flats."

Such are samples of the toils and sufferings to which commercial men must submit in these climes in the pursuit of gain; and, into the bargain, we are informed, "it seems to afford a pleasure to the people to witness an American or Englishman dancing about with sheer impatience, exposed to the hot sunshine, and venting his wrath at the delays which, day after day, he sees not the least probability of getting rid of. The lazy, Spanish shrug of the shoulders, the perfectly care-me-nothing expression of the countenance, and the thousand time reiterated assurance that 'Mañana, ó pasa mañana' (to-morrow, or the day after), all will be right, is the only consolation afforded."

We must, however, take a peep at the river itself:—

"Counted thirty-nine alligators, all of which were lying close together in one extended line. Some of them were very large. It is really horrible to witness them devouring that large fish called the bagre, for which they lie wait in the current and eddies of the river. They bring their huge jaws together upon their prey with a great noise and splashing, and then raise their heads out of the water in order to devour them, which occupies more time than would be expected in such a monster. Should they happen to seize upon the fish crosswise, they have great trouble in placing it in a straight position that they may swallow it, the blood running all the time over their hideous jaws. They sleep a great deal in the sun, with their mouths wide extended. Our boat would frequently get within an oar's length of one without waking it up; and, at this short distance, once or twice I poured a whole charge of duck-shot directly into his throat; but, whether he survived or not, I could not determine, as it invariably got to the water again. When we were about half a league from Los dos Caños we stopped for the night; the bogas

stretched their straw mats on a beautiful playa (sand-bar) of white sand. These mats, with their toldas over their heads, are the only beds they have. Moving around a large fire in the night, cooking their supper, with the white toldas raised around, they would form an excellent tableau for a painter. These fires are also essential for warding off the attacks of the tigers and other wild beasts, whose tracks are to be distinctly traced on every playa in the river. All night long the splashing of the caymans is to be heard as they pounce upon the unlucky fish; and it was with the greatest difficulty that I could pacify the women, and convince them of the impossibility of these animals reaching their heads above the gunwale and lugging them off."

Now for Bogotá; and, first, of the theatre. "There is one great comfort here for those occupying the rear seats, namely, the total absence of any thing like a bonnet—the ladies dress their hair with a single rose, oftentimes fresh plucked from the tree—but this comfort is counterbalanced by the constant attendance of those annoying little wretches, the fleas, which at all times and in all places scrape one's acquaintance unceremoniously enough." What a combination of fleas and roses! it seems worse than Tiberias, where the mighty monarch of these insects is said to keep his court. But from the stage to the realities of life:—

"The middling and better classes cannot be called even ordinary good liver. The few respectable foreigners here, and about three or four Bogotanos, are the only individuals who come within my ideas of comfort in the whole place. The great body of the community are wretchedly poor; and if, in the course of any lucky hit in trade, gambling, or otherwise, an individual of these becomes the possessor of wealth, he still continues to live on amid the same kitchen arrangements as before, filthy though they are. His dress he may change; the ruana will be thrown aside for a broad-cloth cloak, and a beaver substituted for the low-crowned, slouched straw hat, and he will keep a good horse; but as to his home, not a real comfort marks his ability to obtain them. Indeed, the word 'comfort,' in its truest sense and general acceptation, is not to be found in all his vocabulary; therefore not a fork, not an additional article, would be added to his table, nor a single improvement be thought of throughout his wretched household! When he is free from 'dolor de la cabeza,' he will sip his small cup of red-hot chocolate, made as thick as possible of the cocoa and sugar, the very first thing on rising in the morning; then he will light a segar, and take a turn on horseback. From eight to nine he breakfasts on arracacha soup, or rice well greased; fried eggs, seasoned with garlic; boiled potatoes, bread, and a dish of fried beef, which is cut into small strips, without a particle of fat, seasoned well with cummin-seed and garlic, and so over-done that the juices of the meat are entirely dried up; this they eat with a spoon. These people are also fond of a dish called bollo; it looks like an apple-dumpling, and is made with pieces of pork, and seasoned like the dried beef, and well smothered in hog's-lard, all enclosed in a thick paste and boiled. The coffee and chocolate are not drunk with their meat, but immediately afterward, and then the same small cup is made use of as in the morning. The disgusting habit of a whole family using one red earthen goblet, or tituma, in common for drinking from is universally prevalent. Their dinner varies but little from

the breakfast. Their hour of dinning is from one to two; and a 'dulce' of some kind is invariably added. Pork is of very general use among them, while they seem nearly unacquainted with mutton. Plantains and arracachas are seldom to be missed at table, these being their two staple vegetables; the latter, a very tasteless sort of thing, yields most abundantly; indeed, more so than any vegetable I ever saw, and would, no doubt, be a great acquisition to any country. The milk brought to market is shockingly bad, and is generally boiled to prevent it from souring. In short, their whole living is of the most miserable description. The wines generally used are wretched claret, and a sort of mixture made in the country from brandy and sweet molassa, in imitation of teneffice. Those who can afford it import their own wine; and, if brought up the river in wood, the barrel containing it should be enclosed in a box, to prevent the bogs from draining it. Tolerable port or madeira is here worth forty dollars a demijohn of five gallons; brandy thirty-five; English porter sometimes finds its way here, and is worth twelve dollars a dozen for the best. Several attempts have been made to brew a good kind of ale; but, up to this date, with very indifferent success. An English farrier and blacksmith, named Sayres, has made a large brewery, and intends making a fair trial; and no doubt he will succeed, as most excellent crops of barley can be got from the plains. The natives use a variety of sweet drinks, such as organ, raspberry, &c. The annise brandy, home-manufactured, is very good when well made and of sufficient age, that of mompoz being the best. At supper, a bowl of 'massamora' is generally taken before retiring for the night, and is washed down with 'chicha,' combined with which it forms a complete opiate. Those who can afford the luxury take tea or chocolate before this, about seven in the evening. Tea is beginning to be much used now, but it is difficult to procure it good even at three dollars per pound. The servants who wait at table are dirty-looking drabs. The coarse cloth outer petticoat which they wear is scarcely ever removed, day or night, until it is absolutely necessary to supply its place by a new one."

With this picture of the Bogotanos we would conclude, but that we are tempted by the description of a tree, thus noticed among the ruins of Honda:—

"Some parts of these ruins present a most picturesque and unique appearance, which is occasioned by the twistings and twinings of the cancha-trees about them, often forming around a broken pillar, or arched entrance, a perfect casing of the most complicated network, the great force of which, as the roots gain thickness and shoot upward, is sufficient to rend asunder the strongest masonry. I saw here a huge mass of such masonry, from, probably, eight to ten tons' weight, completely separated from the main body, and raised a full foot from the foundation. The neighbourhood of this tree is much dreaded, for should the smallest tendon once gain insertion into some slight rent or crevice in the wall of a house, it will be sure to destroy it, unless prevented in time. They also climb up to the tops of other trees, and often crush the largest of them, and run sometimes along the surface of the ground to an almost incredible distance, destroying every other plant in their course."

We have said nothing of the mercantile details in this publication, though they are of more importance than all the rest to traders

with South America, and will sufficiently recommend it to their attention.

Moseley's Illustrations of Science.

[Second notice.]

WE proceed with some further instructive extracts from this instructive volume. They require no remarks from us; as their side-heads, in italics, are sufficient to guide the reader.

"*The Agency of Capillary Attraction in Nature.*—Let it not be supposed, that the phenomena of capillary attraction are limited to mere experiments in physics, or to its applications in art. Capillarity is one of the most active principles in nature. What is it but this ubiquitous power which retains in the soil of the earth the moisture necessary to vegetation, ministering it, drop by drop, to the radicles of plants and trees; conveying it, at one time, beneath the surface, down the slope of a hill, to the valley below, or to some deep-sunken reservoir; thence lifting it up again to quench the thirst of the parched herbage; checking its progress to the streams, which it would otherwise swell instantaneously to floods—floods, whose waters, having uselessly deluged the land, would be lost as uselessly in the ocean? Take away capillary attraction, or alter it, so that the intensity of the attraction of the solid substances which compose the soil, for water, shall be less instead of more than half the intensity of the attraction of water for itself—and the earth must become a desert. Rain would fall upon it as mercury falls upon a piece of glass—it would roll off it in drops. There would be no fertilising influence in the shower; no moisture could reach the parched roots of plants and trees; vegetation would become extinct—and animal life would gasp itself away in a thick atmosphere of dust. The greater apparent elevation of water, and the greater force of capillarity in its operation in many natural phenomena than in artificial tubes, is to be explained by the extreme proximity of the surfaces between which it there acts. The elevation of water in a tube is inversely proportional to its diameter, or, between two plates, it is inversely proportional to the distance of the plates; thus, if we kept halving the diameter of a tube, or halving the distance between the plates, we should keep doubling the elevation of the fluid. Artificial tubes may thus be made to elevate water to a remarkable height: but nature provides tubes infinitely finer than any that art can reach, and to the capillary elevation of fluids in them there seems to be no limit. The same is the case with particles of earth and sand; the close proximity of their surfaces to one another, gives them a power of capillary attraction, which is almost without limit."

"*Walking.*—In the act of walking, the centre of gravity is raised, alternately, over the legs. The motion somewhat resembling that of a pair of open compasses, made to rest alternately on their points; the centre of gravity is over the fork of the legs, and may be imagined to be over the angle of the compasses. If, as the compasses are thus made to travel forwards, resting on their alternate points, these points are not placed in the same straight line, but alternately to the right and left of it, then the centre of gravity will describe a series of arcs to the right and left, and it will not be carried so far forwards, by a certain number of steps, as though these were made in the same right line; this corresponds to that ungainly motion in walking which is called waddling. It is remarkable how nearly the footsteps of a person who

walks well, are in the same straight line, as may be seen especially if we trace them in the snow: this is, moreover, remarkably the case with animals, horses for instance; and especially it is the case with birds, whose centres of gravity being for the most part very high, in comparison with the dimensions of their feet, they are taught instinctively to avoid those deflexions of their bodies to the right and left, by which they might be overthrown. Taking the width of a man's foot at about three inches, and giving him an average stature, it may be calculated that a deflexion of his body of less than two degrees would, when he rests on either foot, be sufficient to overthrow him. How justly regulated, then, must be the effort which he makes at every step, to transfer his centre of gravity from above one of his feet to above the other, that his position may be kept within this narrow limit! Put upon his shoulders a burden, and you will raise his centre of gravity, and greatly increase the difficulty he will experience in balancing himself; yet how firmly and securely does he tread! A man carrying a burden as heavy as himself, and inclining his position as he steps on each foot, only half a degree to the right or left of the position in which he would rest on that foot, would be overthrown. At each step the centre of gravity is raised, and made to revolve over the foot. It is this raising of the centre of gravity, in which the whole weight of the body may be supposed to be collected, which constitutes the great effort of walking. It has been calculated that at every step the centre of gravity is raised a perpendicular height equal to about one-eleventh the length of the step; so that a person who walks eleven miles, raises his centre of gravity, and therefore the whole weight of his body, a succession of lifts, equivalent to the direct raising of it, one mile. If six men, weighing each 182 lbs., and a boy of half that weight, walk at the rate of eleven miles in three hours, the aggregate of their labour, while thus walking, will be about equal to one horse's power; as the amount of a horse's power is usually estimated."

"*The Hammer.*—The principle of the permanence of the force of communicated motion, so far as any cause within the moving body itself is concerned—that is of its absolute permanence, except in so far as it is counteracted by some external and opposite force— whilst it lies at the very foundation of all just views of the theory, is sufficiently shewn, by the above examples, to be a most important element in the practice of mechanics. What is it, in fact, but this which constitutes the giant force of impact, and makes the hammer a weapon more powerful than any other—irresistible—in moulding and submitting the various objects around him to the uses and purposes of man? There is no machine comparable to the hammer. The force of heat, indeed, insinuates itself between the pores and interstices of bodies, and operating there, separately, upon their particles, breaks them up in detail—but the hammer encounters the accumulated force of their cohesion and overcomes it. The hardest rocks and the most unyielding metals submit to it. If man reigns over inanimate matter, shapes out the face of the earth to his use or to his humour, and puts the impress of his skill and his labour upon the whole face of nature; it is chiefly with the aid which this mighty force of impact gives him. It is this that clears away for him the trees of the forest—that shapes for him the materials of his dwelling—that beats out for him the instruments of tillage—that digs and hoes up the earth—that, after having cut for him his corn,

threshes it, and crushes it into flour—that tames for him his cattle, shapes and binds together his wagons and carts, and makes his roads; in short, there is no use of society for which this force of impact does not labour, and there is no operation of it which does not manifest this tendency of communicated force of motion to permanence. Were there no tendency to permanence in the force of motion which his hammer acquires in its descent, its power on the substance which the artificer seeks to shape out would only be the same as though he were to lay it gently down upon it; its impact would be no greater force than the pressure of its weight. So far is this, however, from being the case, that, as it is well known to the workman, a slight blow from the lightest hammer is sufficient to abrade a surface, which the direct pressure of a ton weight would not make to yield. There is no force in nature comparable to that of impact."

"There is no Principle of Diminution or Decay in the Nature of Motion itself, or in the Nature of the Force of a Moving Body."—This principle is commonly known as the first law of motion. The difficulty of conceiving or admitting it lies in this, that we observe all those forces of motion which are produced around us, continually to diminish, and eventually to become extinct, as it appears to us, of themselves. Our own bodies when we have moved them, do not of themselves move on; fresh efforts must be continually made: our carriages require the continual draught of the horses, and even if we put them on a smooth road of iron, there is required a force continually to impel them: we move a stone with our foot, and but a few steps further on we find it at rest. It is a most wise provision of Providence by which the natural tendency of all these forces to permanence is thus continually destroyed. Without it the world would scarcely be habitable. Were there no friction to check the superfluous force which we give to our bodies at every step, our state of existence would become one of incessant and involuntary motion: every thing we touched would, from that instant, become an ever-moving body; every thing not rooted in the earth, would be a sport of the winds, and men would soon desert the land, to dwell on the sea, as the more stable element. Could we diminish the resistance of friction and the air to any conceivable extent, and if it were found that, as we diminished these, the motion of a moving body approached continually to a state of permanence, so that, by thus diminishing the causes of retardation, we could make the motion to differ from a permanent motion, by as little as we chose, this first law of motion would be completely proved. For if there were any sensible diminution of the force communicated to the mass, arising from a failure in its own energies, and independent of the resistances opposed to it, then that diminution would be apparent and sensible when the resistances were so far diminished as to be insensible. Unfortunately, however, we cannot diminish the resistances of friction and the air beyond certain limits. As an absolute demonstration, this method therefore fails. Nevertheless, the fact that, diminishing the resistances to motion as far as we can, we find it continually approximating to a state of permanence, renders it in a high degree probable, that, if we could carry this diminution on indefinitely, motion would approach indefinitely to a state of permanence, and that if these resistances could be absolutely destroyed, it would become permanent."

* "The body is here supposed not to be endued with vital power."

"Feats of Horsemanship.—The horseman who would ride in a straight line, standing upon his saddle, must so alter the position of his body, with each motion of the horse, as to keep the centre of gravity of his body continually over the narrow base of his feet. This is probably an impracticable task. If, however, instead of riding in a straight line, he rides in a curve, a new force is lent to him to support his weight, acting, too, as if it acted at the same point where his weight may be supposed to act, viz. his centre of gravity; this new force is his centrifugal force. His centre of gravity has now no longer any occasion to be brought over the base of his feet, another horizontal force joins in supporting it, and, poised between the horizontal force and the resistance of its feet, its equilibrium is easily found. To the action of the centrifugal force, which would otherwise overthrow him outwards, the horseman slightly opposes the weight of his body by leaning inwards: and does he find his inclination too great, he urges on his horse, and his centrifugal force, thus increased, raises him up again. By thus varying his velocity and the inclination of his body, the conditions of his equilibrium are placed completely under his control, and he can perform a thousand evolutions, that, moving in a straight line, he could not; he can leap upon his horse, stand upon his head or his hands, whilst he is performing his gyrations, or jump from his horse upon the ground, and running to accompany its motion, vault again upon his saddle: the conditions of his stability, and even the force of his gravity, appear to be mastered. There is, in fact, given to him a third invisible power, by the act of his revolution, which is a certain modification of the force of his onward motion; this acts with him in all the evolutions he makes, and is the secret of all his feats."

(To be continued.)

MISCELLANEOUS.

Two Essays: I. An Inquiry into the Nature of the Numerical Contractions, found in a passage on the Abacus, &c.; II. Notes on Early Calendars. By James Orchard Halliwell, Esq. F.S.A. &c. 8vo. London, 1839. Parker.

WE had neglected this curious tract, when, after two or three weeks, we were put in mind of it by receiving a second edition. It consists of two essays, entirely independent of one another. The first, accompanied with a facsimile from an ancient manuscript, relates to the origin and introduction into Europe of the Arabic numerals. It seems that, about the end of the tenth century, the Christians learnt from the Arabs a mode of calculating, by means of a table (*abacus*), the divisions of which gave a certain place and value to nine characters, which represented the first nine numerals. As they are given in early manuscripts, their characters, though still somewhat grotesque, bear nevertheless a close resemblance to our modern figures, or at least to these figures as they were commonly written from the thirteenth to the sixteenth century. As the awkwardness of the table, or *abacus*, was felt, another arbitrary character, the cipher, was invented; and, by means of it, the places and value of the other figures were marked, without the aid of this table. In this manner, as it appears, originated our modern arithmetical system of notation. The inquiry into the history of the *Abacus* is one of extreme interest and curiosity. The second of these Essays contains some very curious matter

relating to early almanacs, their form and character.

A New Exposition of the System of Euclid's Elements. By Alfred Day, LL.D. 12mo. London, 1839. Hamilton and Co.

THIS little tract deserves the attention of mathematicians. For ourselves, we cannot say that we are advocates for any change in the system of Euclid. His arrangement is so good, and his enunciations and demonstrations so simple and elegant, that we would not willingly give up any part of them—not even those which are proved by what we consider the perfectly strict method of the *reductio ad absurdum*.

Mrs. Hemans's Life and Works, Vol. II. (Edinburgh, Blackwood; London, Cadell; Dublin, Cumming.)—We hail with pleasure the second volume, to the deserts of the first of which we have paid just tribute in two long articles of review within the last month's *Literary Gazette*.

Practical Observations on the Diseases of Women, by W. Jones, M.R.C.S. 8vo. pp. 326. (London and Paris, Baillière, Leipsig, Weigel.)—A publication not for us to analyse. It gives the fruits of the writer's experience, and strongly recommends to the humane the ordinary for the diseases of which it treats, to which institution Mr. Jones is surgeon.

Second Additional Supplement to London's Hortus Britannicus. (London, Longman and Co.)—About 140 pages added to this valuable work which it extends to page 742. The general index with which it concludes is an absolute necessity for all those who possess the *Hortus*.

The Historical Class-book, &c., by John Davenport, author of "The Life of All Pacha" and various books of instruction. 12mo. pp. 492. (London, Relfe and Fletcher.)—A fair and well-arranged selection of historical readings from 1817 to 1837; with the usual information for juvenile readers.

ARTS AND SCIENCES.

THE LAW OF STORMS.

THE labours of Colonel Reid have so directed and riveted general attention to the momentous questions involved in the Law of Storms, that every contribution of facts connected with the phenomena has become of public value. In this light the following may be received. "On March 30th, 1836, at 4 A.M. being in the brig *Matilda*, of St. John, N.B., off the Bay of Naples, the Island of Ischia bearing east, and distant 10 leagues, it blowing hard N.W. and thick weather, I observed a very curious appearance in the N.W. It seemed columnar, and like a lighthouse enveloped in a white blaze of fire, and continued so for fifteen or twenty minutes, and then disappeared. Immediately after the wind fell to a moderate breeze, and the weather cleared up, when we had a fine pleasant day." This is authenticated by the signature of John Buckley, mate of the barque *Barlow*, and was recently sent to Col. Reid, the recipient of a number of similar communications respecting remarkable water-spouts.

That gallant and intelligent officer, we are happy to state, has arrived in safety at his government in Bermuda: and we may add, that the men posted at the signal stations there are ordered to observe the mode of action of water-spouts, which are of frequent occurrence in these latitudes, and to describe them in their own manner, which descriptions will be published in the newspapers (including, we trust, the *Literary Gazette*). The example ought to be followed wherever an opportunity is offered. There was an instance lately seen at Bermuda, which is described as having appeared of a reddish colour in the middle, although the sun was not shining at the time! A collection of data is likely to lead to very curious and interesting discoveries in this new and important branch of Science.

ROYAL GEOGRAPHICAL SOCIETY.

JUNE 24. G. B. Greenough, Esq., President, in the chair.—Extracts from the following papers were read:—1. From a letter com-

municated by Colonel Cohen, U. S., dated Rio de Janeiro, 9th March, 1839, stating that two vessels, the *Medina* and *Mary Jane*, belonging to Mr. Burrows, of New York, had during their recent voyage to the South Atlantic rediscovered the *Aurora Islands*, six in number, and of which Mr. Burrows had made drawings. These islands, which lie about half-way between the Falkland Islands and South Georgia, were discovered, about eighty years since, by the ship *San Miguel*; forty years afterwards, the Spanish government sent the *Atrévada* to search for and examine them. Since this time, many persons — and among others, Weddell, the well-known antarctic navigator — have sought for them in vain; and they have been generally erased from our charts. Mr. Burrows describes these islands as six in number, about 300 feet high, extending north and south for a distance of 2½ miles, without any ship passage between them, and 26 miles to the southward lie some rocks called the *Shag Rocks*. The *Aurora Islands* are stated to be in lat. 53° 22' S., long. 44° 18' W. [The longitude usually assigned to them in our charts is 48° W. of Greenwich.] — 2. 'Extract from a letter from Mr. Thurnburn to Lord Prudhoe,' dated Alexandria, May 25. "The flotilla which the Pashá of Egypt had assembled at Khartúm for the purpose of exploring the *Bahr el Abyad*, or White Nile, has just returned from its experimental trip up that river, during which it was absent thirty-five days: it reached the country of the *Shelukhs* without encountering any opposition. It consists of six boats, having each fifty armed men; and it will start again, after having laid in a year's provisions, as soon as the waters begin to rise." — 3. 'An Account of the *Sinjár Hills*,' by Frederick Forbes, Esq. M.A. of the Bombay Medical Staff. Being at *Mósul*, on his way from India, at the end of September 1838, Mr. Forbes was induced to visit *Sinjár*, on account of nothing being known, except through native report, of that part of Mesopotamia. The first part of his route ran nearly N.W., along the western bank of the *Tigris*, thence leading a little to the northward of west to the ancient town of *Til 'Afar*, singularly situated on four steep, rugged hills of limestone rock, about half way between *Mósul* and *Sinjár*, and the only inhabited place in the open desert. From *Mósul* to the north-eastern shoulder of the *Sinjár* range is about eighty-three miles, in a direction nearly west. After visiting all the villages and other places worthy of notice in the hills, or rather mountains, as they rise 1500 feet above the plain, Mr. Forbes again crossed the desert from their north-western, and in a northerly direction, to *Nisibín*. The *Sinjár* hills are peopled solely by *Yezídí*, or, as they are commonly called, *Dasíní*: they worship the devil, and have many singular rites and superstitions; their number has been greatly exaggerated by report and the terror caused by their depredations; they have at present seventeen inhabited and seven ruined villages, containing a population of upwards of 6000. The courses of the rivers *Hólí*, or *Hawálí*, and *Khábur*, and the situation of the lake of *Khatiniyah* have been hitherto erroneously laid down in our maps: the first-mentioned stream joins the *Khábur* to the westward of the hills; and the lake, instead of being to the southward or eastward of them, is within a few miles to the north of the north-western end. The *Hassáwí* from *Aznówar*, the *Jakhjakhá* or *Mygdonios* from *Nisibín*, and the *Kaukab* from near *Mardin*, all join the *Khábur* before it receives the *Hólí*. That part of the *Mesopo-*

tamian plain between the *Sinjár* hills and the *Karajáh Tagh*, or *Mount Masius* of the ancients, is by no means destitute of water, and has many small rivulets of a few miles in length, but no streams of sufficient size to find their way to the *Khábur* or *Euphrates*. Besides the account of those hills, Mr. Forbes has communicated to the Society the names of all the places in the district of *Mósul*, correctly written in the Arabic characters; and a detailed itinerary of his route from *Mósul* by *Sinjár*, *Nisibín*, and *Mardin*, to *Diyarbekr*; the former part of which is incorrectly laid down in every existing map. — 4. 'On the Nile, and the present and former Levels of Egypt,' by J. G. Wilkinson, Esq. After observing that the *Delta* had not been protruded to any great extent into the Mediterranean since the foundation of ancient cities on the coast, which would otherwise stand far inland after the lapse of so many ages; and that the *Ægyptus* of Homer, from which, he says, the *isle of Pharos* was distant one day's sail, did not signify the land of Egypt, but the river Nile; Mr. Wilkinson made some remarks on the causes of the inundation in the rains which annually fall in Abyssinia, and shewed that the land in the valley of the Nile gradually rises in proportion as the bed of the river becomes more elevated; and the increase of elevation in perpendicular height (which is much smaller in Lower than in Upper Egypt) carries the water of the inundation to a greater distance E. and W. over the plain, now than in former times. For it is evident, says Mr. Wilkinson, that if the bed of the river rises ten feet (the banks augmenting in the same proportion), the water must necessarily flow in a horizontal direction much further upon the shelving slope of the desert, over which the alluvial deposit spreads; and that this elevation of the river and the land actually takes place is abundantly proved by the appearance of ancient monuments, which, when erected, stood above the level of the mud of the Nile and its inundation, and are now buried several feet beneath its accumulated deposits. This is particularly evident from the situation of the two Colossi on the plain of Thebes, whose pedestals, placed not on alluvial soil, but on the sandy slope of the desert, are buried from six feet ten inches to seven feet below the present level of the cultivated land; and is still further proved by the fact of my having found a group of statues some distance behind these Colossi, which, likewise standing in their original position, are now buried up to the waist in the alluvial deposit. The distance from the Colossi to the statues is three hundred feet; the former are buried about seven feet, the latter five feet three inches, giving on an average a difference of twenty inches in three hundred feet, for the gradual slope of the desert, on which they are placed, and on which the alluvial soil has accumulated. From this and from other observations in different parts of Egypt, the conclusion is, that the last has been raised perpendicularly by the deposits of the Nile, nine feet in 1700 years at Elephantine, or the first cataract; at Thebes, about seven; and at Heliopolis, about five feet ten inches, and so on, gradually diminishing towards the sea, though in a greater decreasing ratio, owing to the wider extent of the *Delta*. The height of the banks, and the depression of the land in the interior, are indicated by the form of the dykes, which beginning on a level with the bank, and extending in a horizontal line, stand frequently twelve or fifteen feet above the

land, near the edge of the desert; and the common notion respecting the invasions of the sand is shewn to be exceedingly exaggerated. The sand encroaches on the land on the Libyan side of Egypt, in those places where valleys open from the desert; but this bears a very small proportion to the whole surface of the country, and it is evident from a comparison of the extent of the alluvial deposit, and the partial inroad of the same, that the beneficial effects of the former far exceed the injury done by the latter, and that there is a greater proportion of land capable of cultivation now than at any previous period. The sections across the desert to the Red Sea present a gradual ascent from the valley of the Nile to the eastward, till you reach the summit of a mountain-plain of some extent, from which all the valleys or torrents running in a westerly direction empty themselves into the Nile, and those to the eastward into the Red Sea. In those parts where the primitive range joins the secondary mountains, the descent to the sea is generally shorter and more rapid, but the general character is the same; and on the Libyan side is a similar ascent to the summit of the limestone range, which forms the extensive table-land of that part of Africa. The oases are merely depressions in this mountain-plain — they vary in their depth — the *Oasis parva* being of a much higher level than the Great Oasis; from which we may infer that the springs in the former are not supplied from that part of the Nile lying in the same latitude with it, but from some distant point where the level of the river is more elevated. The water of the Nile percolates to the Great Oasis, by means of the bed of clay which forms its base, entering at some point a little to the south; and the only difference in the origin of the sources of the southern and northern oases is, that one is supplied from the river at no very great distance from it, and that the other traverses a more extensive bed of clay before it reaches the more elevated surface of the *Oasis parva*. Mr. Wilkinson's paper was illustrated by his map of Thebes; the drawing of a new map of Egypt, on a large scale; and several sections across that country, in the parallels of 27°, 28°, 28° 26', and 29°, illustrating admirably the physical features of the remarkable valley of the Nile. Among the maps and donations on the table, was the map of Tuscany in four sheets, on the scale of five miles to an inch, from a trigonometrical survey by Padre G. Iughirami, of the *Scuole Pie*, at Florence, and by him presented to the Society; a map of Northern Africa, by Segato, presented by Count Graberg at Hemes, of Florence; a large map of the N.E. frontier of India, by Captain Boileau Pemberton; the original chart of the Gulf of Cambay, in India, by Lieutenant Ethersey, of the Indian navy, exhibiting the nature and form of the shoals which occasion the remarkable bore, or sudden rise of tide in that gulf; as well its southern extension to the dangerous Malacca Banks, also surveyed by the same officer during the past year. The President announced that, in accordance with the recommendation of Major Jarvis, now on the eve of his departure for India, as surveyor-general, the Council had that day resolved that a complete set of the "London Geographical Journal" should be presented to the public libraries of the chief naval and military stations in India; namely, Calcutta, Madras, Bombay, Bangalore, Hyderabad, Mhow, Dumdum, Khanpúr, Delhi, and Meerut. The Chairman also stated, that he had the satisfaction to acquaint the Society that the trustees had signed an agreement for

a three years' lease of the house No. 3 Waterloo Place, as a temporary abode till an eligible building site could be obtained. The business of the Society would be immediately transferred to those premises; but as the house did not afford a meeting-room sufficiently spacious, we should be indebted to the courtesy of our present landlords for permission to continue to hold the evening meetings at the house of the Horticultural Society. The meetings were adjourned till next November.

ELECTRICAL SOCIETY.

TUESDAY, June 18.—Read, a paper, by Mr. Pollock, entitled, 'An Attempt to answer some Objections to Ampère's Theory of Electric Currents in the Magnet.' Experiments have been brought forward to shew the fallacy of Ampère's views with respect to magnetic action being dependent on electric currents circulating in a magnet in planes perpendicular to its axis. Mr. Pollock, however, believes that the very experiments appealed to, instead of overthrowing, tend to establish the truth of the theory. The paper contained seven objections, which were severally discussed, and their futility shewn.—Read, also, 'Experiments on Voltameters having Electrodes exposing different Surfaces,' by Mr. Gassiot. The importance and universal application of the voltameter as a measurer of the voltaic current, renders it advisable that its action should be experimentally examined under every variety of arrangement which may from time to time arise; but in order that no error or misconception may occur, it is indispensable that the experimentalist should describe as clearly as possible the size of the terminal plates, their approximation, and the strength of the acid solution used; also that the instrument should be insulated, and made in such a manner that the current or force of the battery should have free and direct action through the electrolyte or solution. These requisites have been carefully attended to by Mr. Gassiot, and the interests of science and the objects of the Electrical Society promoted. A principal one of the latter is to examine rigidly assumed facts, and to promulgate the results obtained.

LITERARY AND LEARNED. UNIVERSITY INTELLIGENCE.

OXFORD, June 21.—The following degrees were conferred:—

Bachelor and Doctor in Music (by Accumulation).—S. S. Wesley, Magdalen College, Organist of Exeter Cathedral.
Masters of Arts.—Rev. W. U. Richards, Exeter College; Rev. E. Wells, Fellow of New College.
Bachelor of Arts.—J. G. Blencowe, Christ Church.

The following subjects are proposed for the Chancellor's Prizes for the ensuing year, viz:—

For Latin Verse.—"Pestis Londinens devastans."
For an English Essay.—"Do States, like individuals, inevitably tend, after a certain period of maturity, to decay?"

For a Latin Essay.—"Miles Romanus quando primum, et quibus de causis, coepit libertati Civium obesse?"

Sir Roger Newdick's Prize.—For the best Composition in English Verse, not limited to fifty lines.—"The Judgment of Brutus."

ROYAL ASIATIC SOCIETY.

JUNE 15. Professor Wilson in the chair.—At this meeting, his highness, Sultan Mahmûd, was elected an honorary member of the Society; and a donation from his highness, consisting of fourteen volumes of Turkish works printed at the imperial press of Constantinople, was laid upon the table. Thomas Newnham, Esq., presented several ancient gold Hindu coins and medals, and three Oriental MSS., &c.; and from G. W. Traill, Esq., the Society received an immense sheet of paper, measuring

sixty feet by twenty-five, made at Kumam, as a specimen of the native manufacturers' skill. This donation was accompanied by a memorandum written by Mr. Traill, descriptive of the processes of making the paper, and of the useful quality it possessed of being invulnerable to insects.—An Analysis, by W. Morley, Esq., of a portion of the "Jamal Tuarikh," of Rashid eddin, which has hitherto been supposed to be lost, was read to the meeting. The paper stated that the original work of Rashid eddin comprised four volumes; of those, the first contained a history of the Turks and Mongols to the time of Oljaitu; the second continued the same history to the time of the writer, with several other matters; the third volume contained a history of Mahommed, and the Arab tribes from whom he descended; and the fourth was chiefly geographical. Of all these, the first volume is the only one that has been hitherto known to exist; and a portion of that volume has been recently published by the French government, with a translation by M. Quatremère. The remaining volumes are rarely mentioned even by Oriental writers, and are supposed to have been destroyed several centuries ago. The part of which an analysis was read to the meeting is a portion of the second volume. The copy is of a great antiquity, and was written in the lifetime of the author; in fact, within four years after he had completed his history. It is only a fragment; but it is well preserved; written in a beautiful hand, on large paper, and extends to fifty-nine folios, with numerous paintings, very well executed. The first part contains portions of the life of Mahommed, and is illustrated by three paintings. The second contains portions of a history of China; and is illustrated by numerous paintings of the kings recorded in the text. The names are Chinese, but the numbering of the dynasties, and the synchronisms, with historical events better known to us, by no means accord with the accounts of the history of China as given by modern writers. The third part contains the history of India; and, with the exception of one little hiatus, is complete. This is divided into two sections: the first begins with the chronology, geography, and natural history of India, and goes on to detail the history and genealogies of the kings of Delhi previous to the Mahomedan conquest; the second section contains an account of the Hindu divinities, whom it names prophets; it specifies Mahishur, Washur, and Brahma,—evidently Maheswara, Vishnu, and Brahma; and then proceeds to Shaktuni, or Buddha, on whose birth, history, and qualifications, it more especially dilates: in fact, nearly the whole of this section treats of the precepts and practice of Buddhism, or the religion founded by Shaktuni. The fourth book is only a fragment; it contains the history of the Jews, according to the Mahomedan tradition, and is illustrated by nine paintings. The reading of the paper was not concluded; but we understand it will appear in a forthcoming number of the Society's Journal. The meetings were adjourned till November.

ROYAL SOCIETY OF LITERATURE.

MR. HALLAM in the chair.—The last meeting of the season. Members were admitted, and other routine business done. A *Life of Gildas*, by Mr. Wright, was read, being a specimen of the *Biographica Literaria Britannica* in progress under the auspices of the Society; and the first volume of which, embracing the Anglo-Saxon period, is entrusted to that gentleman.

It noticed the two lives of the saint by Caradoc and a Welsh monk in the eleventh and twelfth centuries, and compared their statements with pseudo-contemporary events, with the mention of individuals by other authors, and with various chronological tests. The conclusion appeared to be that the hitherto-received biography is fictitious—a theological forgery in the quarrels between the Anglo-Saxon and British Churches. In short, the life of Gildas, instead of beginning a British, might well begin an Irish series, being the life of a Saint who never lived!! The whole paper was interesting, and the thanks of the meeting were cordially voted to the writer. A very short 'Defence of the first Demonstration of Euclid,' by Mr. Orchard Halliwell, concluded the readings. The curious metaphysico-mathematical objection, that a point, being that which "has no parts," could not generate a line, which has parts, was met by Mr. Halliwell, on the ground that the point was, and was meant to be, a mathematical abstraction, and the definition perfectly correct. *Non nostrum*; but the idea is ingenious, and it was well put.

FINE ARTS.

A Letter to Sir Martin Archer Shee, F.R.S., President of the Royal Academy of Arts, &c. &c. &c. on the Reform of the Royal Academy. By Edward Edwards, Esq., Hon. Secretary of the Art-Union of London. 8vo. pp. 44. London, 1839. Printed for Private Circulation.

THIS is a very moderate, temperate, and sensible appeal for certain alterations and reforms in the Royal Academy, and treats the question without asperity or vindictive assault. To the president it pays the honour so justly due to his high character in art, literature, and the estimation of society; and then argues its own propositions in a gentlemanlike style. The writer says:—

"The Royal Academy is, first, an assembly of honour in the arts; secondly, a chief school of instruction in the arts; and, thirdly, a directing body for the chief exhibition of current productions in the arts. I have hereafter adduced, at some length, the arguments which seem to me to be conclusive against containing the combination of all these functions in one and the same body of men, assuming that body to be always composed of the ablest and the purest men in Europe. The principal remedy which, with much deference, I have ventured to suggest, is entirely to dismember the third of these functions from the other two, so as to make the Academy a central school of instruction in the arts, and an assembly of honour in the arts, and nothing more. The exhibition I have proposed to leave to the management of an elective and renewable body, chosen by the whole of the exhibitors of a certain standing. Although fully recognising the soundness of the general principle, that it is inexpedient to make teachers the conferrers of diplomas on their pupils, yet I conceive that in the present case of the Royal Academy, the apprehended evil will be removed, as soon as the number of academicians shall become unlimited by its laws. The diploma-conferring body will then be so much larger than the actual number of professors, as to be for all useful purposes perfectly independent of them. The further reforms in the Academy, considered as an assembly of honour, which have appeared to me fairly to grow out of the collected evidence, *pro et contra*, are comprised in the full recognition of engravers and the abolition of the class of associates."

Elsewhere he contends, that

"To give to an assembly of honour, by which alone the highest claims of every artist in the country are to be adjudged, an uncontrolled power over the exhibition or non-exhibition of the works on which these claims are founded, and by which they are to be justified, is at once to give temptation to an abuse of power; and having thereby induced that abuse (the best constituted bodies being fallible), further to take away all appeal from its injustices. The object of an honorary distinction, such as R.A., is to stamp a man's pretensions as an artist with the sanction of those who are best qualified to judge of them. To the individual it is a most gratifying honour; to the public a most valuable indication. But as no imaginable association for conferring such distinctions can be made to work with unerring certainty, so the existence of them becomes an evil directly they are made indispensable conditions to the notice and favours of the public. The object of an exhibition is to afford every candidate for the favour of the public an opportunity of obtaining it, irrespective of any particular distinction or mark of honour whatsoever; and it is at once the means of judging of the propriety of such distinctions in the cases wherein they have been conferred, and the court of final appeal against real or supposed error or injustice in the cases wherein they have been refused. But to unite the control of honours and of public exhibitions in the same hands, is to place not alone the professional distinction, but also the very means of subsistence of the rising artist at the absolute disposal of a body of men who are at once his competitors and his judges. It is to vest in one fallible court the enormous powers of primary judgment and of final appeal."

We wrote this on the day that all the candidates whose hopes depended upon their acceptance and place in the Exhibition of the year, sent in their pictures; and we felt that there was much force in Mr. Edwards's remarks. An elected exhibition committee is proposed as the remedy, and Mr. E. concludes:—

"I will only add my earnest hope, that the first point to engage the attention of such a committee, would be the practicability of effecting a classification of the pictures exhibited, at least into the broad divisions of history and poetry—landscape—and portraiture. Such a step is indispensable, if it is to be really the aim of our future exhibitions to improve and elevate the public taste, and not to degrade it. It might then be hoped that our chief annual exhibition, under the management of a clearly responsible body, free from the distraction of other objects, and therefore under no undue anxiety about the amount of receipts at the doors, and free also to take public measures to promote the sale of the works committed to their charge, would both increase the immediate rewards of our artists, and powerfully contribute to bring about that enlightened and liberal appreciation on the part of the great mass of the public, which alone affords a sure basis for the future and permanent prosperity of the arts in this country. I submit, then, that the most desirable reform in the Royal Academy,—the reform which would most extend and strengthen its usefulness,—consists:—1. In the separation of its functions as assembly of honour, and as school of instruction, from those which are connected with the annual exhibition, confining it wholly to the former. 2. In the removal of the limitation as to the number of its members; the recognition of engravers as full members, forming an integral part of the

academic body; and the abolition of the class of associates. 3. In the appropriation of such a sum from public funds as shall be sufficient, when added to the proceeds of the funded property at present possessed by the Academy, to provide for the liberal increase of its means of instruction—as lectures, collections, and the like—and for its future permanent maintenance, as assembly and as central school; and, 4. In adequate provision for the official inspection of its schools, and for the publication of periodical reports upon its general proceedings. I confess I am not without a fear that the changes here proposed will be regarded by some as going too far, and by others as not going far enough; but as to the former, I have reason to believe that some of the most eminent of the academicians themselves are convinced there must be some reform, and I cannot doubt that as inquiry proceeds, it will be more and more evident that nothing short of the reform here advocated will be found adequate to the occasion."

THE NELSON MONUMENT.*

WE regret to say that the fears which we expressed in our last Number have been realised. On Saturday, the 23d instant, the committee of noblemen and gentlemen appointed to decide on the comparative pretensions of the various models and designs for the Nelson Monument, met at the Thatched House Tavern, the Duke of Wellington in the chair, and determined, by ballot, in favour of Mr. Railton's column. A column! Far be it from us to undervalue the abilities and attainments of Mr. Railton, who is an architect of great talent, cultivated by an assiduous study of the finest remains of antiquity; but we cannot think with common patience of the erection of so meagre and inappropriate a memorial to the most illustrious naval hero whom even this country ever produced. Nor can anything be more unjust towards these English artists of a higher class, who have devoted their lives to the acquisition of a knowledge of the human form, of the developments of human character, of the expression of human feelings, and of the principles by which all the great masters have been regulated in their most magnificent and celebrated compositions, than thus to hold them up to the ridicule of Europe, as a body of men out of whom it was impossible to select an individual qualified to execute the proposed subject in a manner more worthy of its national dignity and importance. And even with reference to the recent collection of models and designs, while we admit that, as a

* (The following memorial was sent from many of the artists concerned, and was read to the committee by Sir G. Cockburn, just before the ballot: we insert it without offering any opinion, at present, as the copy only reached us at a late hour.—Ed. L. G.)

"To the Committee for Erecting a Monument to the Memory of Lord Nelson.

"Lords and Gentlemen,—We the undersigned competitors for the Nelson Memorial, being convinced that the principle of publicity of exhibition previous to adjudication, as intended by your resolution of the 29th of May, is the best mode of securing a satisfactory result, regret that so small a part of the subscribers, and of the public, has seen the designs, and respectfully submit—

"That a partial exhibition encourages partial statements in the public journals unchecked by public opinion:

"That every opportunity of inspecting the designs is due to every subscriber, and the greatest publicity, consistent with the safety of the models and drawings, would be highly interesting, not only to the public, but also to the artists who have devoted so much time to a subject of national importance.

"That such exhibition may greatly conduce to the increase of the memorial fund:—

"We therefore pray your Committee to allow the exhibition to continue, without those restrictions on subscribers and the public that completely neutralise the liberal intention of your resolution of the 29th of May.—We remain, Lords and Gentlemen, your very respectful humble servants.

"Friday, June 1st, 1828."

whole, it was not what it might have been,—a circumstance which we now suspect was chiefly owing to what has proved to be a well-founded doubt on the part of some of our best artists, as to the capacity for judgment of the majority of those who were to pronounce upon the matter (a majority, we are told, of three).—we confidently assert that it contained several productions of sterling merit, the adoption of any one of which would have been honourable to all parties, and therefore satisfactory to the country, which we are convinced a mere column, with a figure of Nelson perched on its summit, like a disobedient Middy mast-headed, or a superstitious Fakier doing penance in Hindustan, will never be.

FINE ARTS IN AMERICA.

WE see by the "New York Literary Gazette" (No. 18), that the friends and admirers of Mr. Allston, have made an Exhibition of his Paintings at Boston, where, and at Cambridgeport, he has generally resided since his return to America from England in 1818. The proceeds are to be presented to him as a token of the high sense entertained by his fellow-citizens of "his pre-eminence as an artist," and "esteem and affection for him as a man." The Exhibition consists of forty-five of his productions, including several of those by which his talents were made known to the British public. Among these is "The Dead Man restored to Life," for which he obtained the first prize of two hundred guineas at the British Institution; Jeremiah dictating his prophecy to Baruch; the Triumphal Song of Miriam; Beatrice; Rosalie; the Sisters; Isaac of York; and heads of Polish Jews, &c. &c. &c. In describing them, some very touching poetry from the pen of Mr. Allston himself, as well as some by Mrs. Sigourney, are given by way of illustration; and the whole seems most creditable to American Art and patriotic feeling. The school of that country is taking the right road to advancement; and succeeding Sully, whose picture of our Queen has met with so much applause, we will venture to predict of her young Portrait-Painter, Mr. Healy, whose works enrich our present Exhibition, that when he has, like Allston, studied the great masters in Italy, he will be a most popular and worthy successor to her most gifted sons.

NEW PUBLICATIONS.

Saracenic and Norman Remains. Sketched and Drawn on Stone by G. Moore; Printed by Hullmandel. Murray.

CURIOUS and beautiful. The impressions in colours are very splendid, and shew the perfection which the art of lithographic printing has attained.

The Great Seal of England. Engraved by Freebairn, with Bates's Patent Anaglyptograph. Ackermann and Co.

IN our notice of the present Exhibition of the Royal Academy, we described an impression of the Great Seal of England, by Mr. Wyon, as a fine specimen of that gentleman's skill and taste. Whoever wishes to possess a facsimile representation of it, has the opportunity afforded him by this admirable plate; which is a striking and beautiful example of the new process of medallion engraving.

Dramatic Sketches, by R. J. Lane, A.R.A. No. VII. Mitchell.

THE present number completes the first series of this clever, and, as we predicted it would be, "popular," publication. It contains portraits

of Miss Murray, Mr. Didear, Mr. G. Bennett, Mrs. Warner, Mr. Meadows, and Miss E. Phillips. Although undoubtedly the most difficult, Mr. Lane seems to us to have been throughout the thirty plates, or rather stones, of the series, most successful in his female subjects; to which he has communicated great and characteristic expression, without any sacrifice of resemblance.

SKETCHES.

CEYLON.

We publish the following able paper upon the 'Progress and Prospects of the Island of Ceylon': it is extracted from "The Friend" (January 1839), a periodical missionary tract; and, although palpably breathing a missionary spirit, it is well worth the attention of every man really interested in the colonial possessions of the empire:—

"The situation of Ceylon, whether we regard it in its geographical, political, or religious aspect, must render it a place of immense importance in the ages to come; and it is not impossible that Ceylon may be destined to exercise upon Asia the same influence that Great Britain has exercised upon the continent of Europe. It is bound to the myriads of India by position, and to the still mightier myriads of China, Siam, and Burma, by religion; the emancipation of Ceylon from the trammels of a fell superstition will be an example to those who groan under the spell of the more ancient Brahmin; its shores may afford a refuge to their persecuted churches; and the fall of Buddhism in this island will probably be its fall throughout the world. Separated from all other countries by its insular position, it is safe, even at this early period, to grant unto the natives a degree of political liberty that might be highly imprudent, under present circumstances, if extended to the varied population of our Indian possessions. The island of Ceylon has always been regarded with peculiar interest by the different nations with which it has been connected: old Sinbad speaks for the legends of the Arabian navigators; Ravana, the giant-king, for the romances of the Brahmins; and the thousands of pilgrims who annually visit the temple of Calany, and other consecrated spots, are equal evidence of the prominent place it maintains in the bane of the atheist Budha. Its spices, gems, and pearls, have been celebrated from the most distant ages; and its groves of palms, that encircle its shores as a band of beauty in the monarch's diadem; the rich valleys of its maritime provinces; and the magnificent scenery that is presented among the cloud-capped heights of its majestic mountains, will render it an object of deep veneration to the favoured traveller, when the discoveries of science have carried rapidity of communication to its utmost limit, and converted the inhabitant of our antipodes into our neighbour. The present importance of Ceylon as a colony of the British crown deserves our especial notice. We are dazzled by the more splendid acquirements of the East India Company; and it is, therefore, necessary that we resort to calculation, and thus illustrate our subject by the details of sober fact. The entire population of the whole of the British colonies was recently estimated at 3,083,542; that of Ceylon cannot now be far short of 1,500,000, one-half of the whole amount. It has twice the population of all our West India islands, and more than twice the population of Canada, the politics of which are now arresting the attention of the western world. In revenue, as well, our island stands

at the head of the colonial list; its income is equal to three-fourths of the revenue of the whole of our West India islands, superior to that of the Mauritius and New South Wales, and double the amount of that of Jamaica. When the aggregate of revenue is divided among the whole population of Ceylon, it will assign nearly 6s. to each individual, which is less than the average of almost any European state, though more than the average presented by the dominions of the East India Company. The census of 1835 gives a population of 50 to the square mile, whilst in Great Britain the average is 268. The capabilities of the island are, therefore, very far from being exhausted; and it may be regarded as only in the commencement of its career towards the possession of wealth and importance. The commerce of Ceylon presents anomalies that require a more minute examination than we are able to give them in our present number. With immense tracts of country once cultivated, but now waste, we are annually importing grain to the value of nearly 200,000*l*. Under some circumstances this might be no disadvantage; for instance, the population might be engaged in some manufacture, or in some branch of commerce, that would be more productive than the growth of grain. But that this is not the case, we learn from the fact that one-half of the male population is engaged in agriculture, though in England the proportion is not more than one-eleventh; yet in England there is comparatively little importation of grain. Making all allowances for superior science, greater physical strength, and difference of soil and climate, it is evident that there must be an immense mass of manual power in Ceylon, now utterly inactive, that, under other circumstances, might be turned to some good account. The greatest exports last year, in the order of detail, were coffee, cinnamon, cocoa-nut oil, arrack, tobacco, and coir. All these articles are produced with comparatively little toil, and there is thus a reciprocity between the habits of the people and the productions of their country, by which wealth is poured into their lap, almost without the necessity of any effort that would disturb their general indolence. Among the imports, we regret to see the increase in opium; and among the exports, in arrack. It is the part of a righteous people to bless and be blessed; but they who engage in traffic of this description are on the way to curse and be cursed. We are not of those who scowl at commerce as at the pestilence, and would wish the whole world one vast Arcadia; nor yet are we utilitarians, to regard nothing as worthy of attention the value of which cannot be exhibited in pounds, shillings, and pence. We would pursue a middle course, and regard commerce as a blessing, not simply because of the wealth it produces, but because of the activity it calls into existence, and the facilities it affords for the progress of science and the extension of the truth. No nation can be really happy that is inactive; there may be the appearance of happiness and contentment, but it is too often only like the flower that nods to the breeze upon the surface of the swamp, when around there is corruption and death. The people of England at one time had no idea of the importance of the struggles they were carrying on in favour of civil and religious liberty. The first mariners who ventured into the unknown seas of the east and west little dreamt of the effects that were to follow their unexampled enterprise. These mighty consequences are now becoming apparent. The want of energy among the eastern nations,—

indeed the inhabitants of the tropics generally may be included,—is so common a defect, that many ages must have rolled over; under the most favourable circumstances, before they would have released themselves, unaided, from the tyranny of their priests and kings; but by the wonderful workings of Divine Providence—in which, as in the vision of the prophet, there are wheels within wheels, and in the wheels a spirit—these nations have been given for a time into the hands of Europeans, and there is thus granted unto them, without a single effort on their part, the civil and religious privileges for which the fathers of the English hierarchy, and the founders of the British constitution, were burnt at the stake or beheaded upon the scaffold. The British rule has not partaken of the character of the native population since we obtained possession of Ceylon. In Governor North, there was kindness to soothe a conquered people; in Governor Maitland, there was sternness to restore an attention to discipline; in Governor Brownrigg, there was again mildness and judgment to consolidate and mature; in Governor Barnes, there was enterprise and decision to develop the capabilities of the country, and enforce the observance of command. In Governor Wilmot Horton there was an attachment to liberal institutions, which rendered him a fit instrument to emancipate the people from oppression; and in our present right honourable governor there is apparent a sincere desire to promote the general prosperity of the people, and to further the progress of Christianity among the natives, without any of that fierceness of zeal that would defeat its own object by too great precipitation. There are few instances, we should suppose, in the annals of the world, in which a subjugated people have derived from their conquerors so many real benefits as the people of Ceylon. In the enumeration of these benefits we commence with that which is of the highest importance, religion; and we may then glance for a moment at others, which are in themselves of mighty consequence, though confessedly inferior to the subject-matter that relates to all eternity, as well as to all time. The downfall of Buddhism is now no longer a doubtful question: its outworks are tottering to their foundation, and we hope soon to sap the citadel, and raise it to the ground. The attacks of the missionaries become more powerful as they acquire a more intimate acquaintance with the idioms of the language, and a greater familiarity with the elaborate absurdities of the native books. The natives themselves are daily becoming better acquainted with the essentials of our holy religion; they see that there is an important difference between the possession of the name of Christ, and the sincere reception of that pardon and purity which are offered to all true believers through the merits of the great atonement; there are hundreds who are joined in church fellowship with the different Christian societies; there are thousands who sit regularly under the ministry of the word of reconciliation; there are upwards of 20,000 children who are receiving their education, more or less directly, through European influence; information on all subjects is eagerly sought for; the Scriptures have been widely circulated; and the church of Ceylon is beginning to present a name, a locality, purity, and a form right lovely and beautiful. To the last Calany festival, not a single person went from four adjacent villages, at a little distance from Negombo; and from four others the numbers that attended were far inferior to the multitudes of former years. The mission station at Am-

blamgotta has been re-established, under very favourable auspices. Within the year a Baptist church has been commenced in the Kandian district of Matella, connected with which there are many incidents of the most gratifying description. At a missionary meeting of the same society, recently held in Colombo, a scene of Christian charity was presented, which carried our minds forward to that bright period shadowed forth in the visions of prophecy, when all pretensions to exclusive privilege and exclusive purity shall be utterly unknown; there were seen upon the same platform, united together in the same great cause, his excellency the governor, the acting chief justice, gentlemen of the military and civil services, and missionaries of the Church, Baptist, and Wesleyan Societies. The returns of the Church Missionary Society give an increase upon 1837 of 18 labourers, 9 congregations, 53 attendants upon the ministry, 409 boys, and 76 girls, educated in the schools. In enumerating the signs of the times we may also mention, that not long ago a petition was presented to the Roman Catholic priests, signed by many thousands of their followers, demanding more constant and more efficient instruction, and threatening, in case of refusal, to appeal, for the purpose, to the pope at Rome. We would recommend these good people to become Protestants at once, for by no other means can they accomplish the noble objects they have in view. Among our social advantages, may be mentioned the number and excellence of the roads throughout the island, by which trade and civilisation are greatly facilitated; the establishment of the savings' bank, in which the amount of native deposits is regularly increasing; and the institution of societies similar to the Friend in Need Society, for the relief of the necessitous poor. At all our most important stations circulating libraries have been commenced. The natives are now accustomed to expend a little more of their money in household comforts, and their general mode of living is more respectable. We are not aware that any branch of commerce has been established, within the power of native means, which they have not embraced, and some of them are extensive cultivators of coffee. The system of clanship is becoming less powerful; the people are more willing to work at new modes of employment, if the remuneration be adequate; and they are every day increasing in industry and enterprise. The recent extension of their political privileges has performed wonders; though the natives, at first, supposed it was a pretended boon, that was designed in reality to bring them under some more powerful system of oppression. Now, admitted into the legislative council, and with the prospect of other high offices opened before them, they are awaking as from a dream; and though in some instances they have exhibited the heaviness always attendant upon the first arousing from a protracted stupor, in others they have opened their eyes fully to the light, and are embracing the privileges it presents. We could wish to see, on the part of Europeans, a greater readiness to admit the natives to the benefits of social intercourse. It is not the want of intelligence on the part of the native gentlemen that has hitherto shut them out from the European circle, but the too great readiness of many to take improper advantage of their situation, and to obtrude their own private concerns upon the notice of their more influential associates. In respectable society, any man, whatever his present rank or hereditary honours may be, is utterly detested if he talks

much about himself or his own family affairs and connexions. Were the persons to whom we refer to assume less, to be equally respectful after any attention is paid them with what they were previously, we have little doubt that their position in society would soon be raised in a very great degree. That there are native gentlemen who are worthy of any confidence that can be reposed in their integrity, has been too often proved to require additional evidence from us. We understand, that on a recent circuit, F. De Livera, Esq., the district judge of Tangalle, in the Southern Province, received from the honourable the puisne justice, a public acknowledgment of the great judgment displayed in the decisions he has pronounced since his elevation to the bench. To those most respectable individuals in Colombo, who are affording their daughters the advantages of a liberal education, the loudest applause is due; and the intelligence displayed by the young ladies themselves at a recent public examination, has earned for them a meed of praise, that must be equally gratifying to their parents, their instructress, and those benevolent ladies who have watched over the interests of the school with so much solicitude. The examination was the more memorable, as it was a circumstance unprecedented in India to see eastern females of the highest classes in such a situation; a fact which was noticed at the time, if we remember right, by His Excellency the Governor. From the natural mildness of the native disposition, we can conceive of no character more engaging or more lovely than that of a well-educated Ceylonee female, living in the fear of God. Notwithstanding these remarks, our praise is not to be indiscriminate, and our congratulations must be bounded by a proper limit. The promises of life are yet seen only on the surface of society; the mass is yet in chaos, 'without form, and void.' The circumstances of the colony require a more efficient school commission, for the general purposes of education; we have few elementary books of science in the native languages for the instruction of the rising generation; a more consistent regulation is required to enforce the sanctity of the Sabbath; slavery yet exists among us; and we have no properly-regulated system of registration, especially for the Central Province. The questions that affect only particular classes are not to be agitated through this medium; otherwise we might mention several of deep importance; but for this contest we must buckle on our arms in another arena. As a minor desideratum we may remark, that no society, as in the presidencies of India, has yet been instituted in connexion with the Royal Asiatic Society, for the purpose of illustrating the religion, topography, philosophy, and ancient history of the island. We have to regret the increase of the traffic in arrack, and the spread of intemperance among the people; and we have to deprecate, which we do from our innermost soul, the interference of the government in the appointment and maintenance of the Buddhist priesthood, a foul blot upon our national escutcheon, which is thus made to present as its crest the cross of Christ, surmounting a shield sable, on which is emblazoned a heathen temple, and of which the sinister supporter is a demon, and the dexter an atheistical priest. These are circumstances to be regretted; but there are other processes in the course of development, that warrant the indulgence of the most pleasing anticipations relative to the future destiny of Ceylon, and that convert what might otherwise appear to be the language of enthusiasm into the reality of truth. We may now be enveloped in mist and

gloom, but we can discover glorious lights playing in the horizon, and silencing the summits of the hills, that are the sure sign of coming brightness and splendour; and there are intervals even now when a few cheering rays dart down into the depths of our darkness, and surround us for a moment as with the majesty of heaven."

BIOGRAPHY.

LIEUT.-GENERAL GEORGE AINSLIE.

AN old and esteemed friend, who died at Edinburgh on the 16th of April, ought not to descend into the grave without a notice in our Literary Obituary. Lieut.-Gen. Ainslie was of a highly respectable Scottish family; and early in life entered into the military profession, to which he was long an ornament; being for a considerable period governor of Cape Sydney, and afterwards of the island of Dominica. On his return home from the latter appointment, finding the idle time of peace hang heavy on his hands, the general sought a pursuit, and fortunately turned his attention to numismatology with all the ardour of a true amateur. The particular branch to which he devoted himself was the collection of Anglo-Norman coins; and his zeal was rewarded by many rare acquisitions, and some of them of much value in determining historical dates and events. When any interesting evidence of this kind came in view, he was indefatigable in his efforts to obtain it; and years of patience, the travel of many hundreds of miles, and the procuring other coins, by which he might acquire his coveted object in exchange, were no obstacles to his industry and enthusiasm. In 1830, he published an account of these treasures, under the title of "Anglo-French Coinage, 4to. John Hearne," and sold at 2l. 12s. 6d. The work is beautifully and correctly produced, and does honour to the art and its illustrations. A sale of some of the duplicates in his possession, a year or two after this publication, attracted the attention of numismatologists, and some of the most curious were bought for the British Museum. We should suppose it likely that the whole collection would now be brought to the hammer, including a seal of the Black Prince, and other remarkable articles. Gen. Ainslie married a lady, we believe, of the Noel family, who survives him. His sister was married to the Earl of Moray. Capt. Henry F. Ainslie, of the 83d regiment, now in Canada; Capt. Frederick, of the 21st regiment, in Bombay; and three daughters, the youngest married to Capt. Mackay (son of the Hon. Mrs. Mackay, of Baker Street), are the remaining children of General Ainslie. He was sixty-three years of age.

THE DRAMA.

Her Majesty's Theatre.—Donizetti's pleasant, lively *L'Elisir d'Amour*, with the charming Persiani for its heroine, has been twice played, and we hope will be often repeated during the season. We prefer Persiani in tragedy; but are compelled to allow she is also very delightful in comedy. She plays as well as sings the part of Adina with perfect naïveté and exquisite sweetness. Lablache, in *Dulcamara*, gives full force to his truly comic part; at the same time, the value of his magnificent voice is evident, more particularly in concerted music. Tamburini is a jovial, light-hearted *Serjeant Belcour*; and very effective in his share of music. Signor Mario is somewhat in the background in this opera; his want of power is much felt in the concerted pieces, though, to do him justice, his solos are given with pure taste

and melodious voice. We never wish to hear "Una furtiva lagrima" better sung than by this gentleman.

Drury Lane.—Mr. Russell's benefit was, we rejoice to hear, a fair one; though the house was not quite so crowded as the friends of private character connected with the drama, and talent long tried upon the stage, could have wished.

Haymarket Theatre.—Mr. Kean concluded his farewell engagement last night, and has played throughout to excellent houses. A new entertainment, called the *Organ of Order*, has been produced; and well sustained by Farren, Strickland, and Mrs. Fitzwilliam; the latter of whom, in the character of a Frenchwoman, sings a capital ballad, and is nightly encored. The piece itself consists of practical jests played by Strickland, an old joker, on Farren, who is no joker at all; and the audience laugh a good deal at them, though they are rather too much repeated to amuse altogether to the end.

VARIETIES.

The Literary Fund.—On Saturday, the Sub-anniversary at Richmond, Mr. W. Tnoke in the chair, went off most pleasantly. It was a curious coincidence that on the 50th year, exactly fifty guests sat down to dinner. Among them were Lord Glengall, Mr. James, Mr. Hill, the late M.P. for Hull, Mr. Bentley, Mr. Brockedon, and many gentlemen connected in various ways with the literature of the times, and friends to this excellent and efficient Fund. The toasts were given with much neatness and genial feeling, and were received with general applause. Some agreeable amateur songs contributed to the harmony and gratification of the company.

Royalty.—In days of yore, a touch from royalty was held to be a cure for the Evil; but such is the change in our day, we see in "The Times" an advertisement of a benefit concert for a poor foreign lady,* "suddenly afflicted by paralysis, under the immediate patronage of Her Majesty, the Queen Dowager," &c. &c.

Mount Hecla, removed from Iceland to the Surrey Zoological Gardens, is really an extraordinary production. By a combination of water, scenery, machinery, and fireworks, effects are wrought which cannot be imagined without seeing them. The weather has not been favourable since the opening on Monday; but such are the attractions, that the efforts of the artist, and the liberal spirit of the proprietor, are sure to meet with the popularity they so richly deserve.

Charley Chalk (No. I., G. Berger), is another aspirant of the Pickwick school; much after the usual manner, and commencing the career of an artist. We shall see how it goes on.

H.B. has made out his six hundredth caricature. An illustration of the "Compleat Angler" represents Mr. Warburton throwing out a bait to catch a gudgeon (Lord John Russell), a most exquisite little fish, swimming off, but still hankering to rise. The Duke of Wellington says, "That was a nibble but no bite," whilst Peel declares that the angler is an old hand at the work, and will be sure to hook his fish. He has a few already in his creel at his feet, and is a humorous personation of the individual and the sport. The next is a curious instance of (unilateral) resuscitation, effected by distinguished members of the *Royal Humane Society*: the Queen and the bedchamber ladies medicating Lord Melbourne.

Her majesty is applying *sal volatile*, and exclaims, "Ah, there's a dear! now do revive." The whole scene is a capital one, and the various expressions of the pretty countenances very amusing. "A New Version of Can't Get Out" concludes the hundred. It is played by Peel, Lord Stanley, Sir J. Graham, &c. &c.; and Brougham is looking in at the window, wondering at the game, and saying, that he understands "Can't Get In" perfectly.

LITERARY NOVELTIES.

In the Press.

Narrative of a Voyage to Madeira, Teneriffe, and along the Shores of the Mediterranean, with Observations on the Present State and Prospects of Egypt and Palestine, &c. &c., by W. R. Wilde, M.R.I.A.—A Greek Lexicon to the New Testament, on the basis of Dr. Robinson's; designed for Junior Students in Divinity and the Higher Classes in Schools, by Charles Robson, Typographer.

THE TRAGEDY of GERTRUDE and BEATRICE.
"Mr. Stephens takes, and is entitled to take, rank much higher than Mr. Sheridan Knowles and Sir E. L. Bulwer; and if no other proof were existent, 'Gertrude and Beatrice' would alone suffice."—*The Canadian Magazine*.
C. Mitchell, Red Lion Court, Fleet Street.

THE TRAGEDY of GERTRUDE and BEATRICE.

Now ready at all the Libraries, in 8vo. 4s. 6d.
THE TRAGEDY of ALARCOS.
By the Author of "Vivian Grey."
"This admirable tragedy fully answers to the high reputation already attained by its writer in other departments of literature. It is one of the finest dramatic poems that our day has produced. A full of passion, finely discriminated in character, and with sufficient incident to keep the attention alive from the beginning to the close. It presents scenes of pathos and passion that have scarcely been surpassed, if equalled, by any living dramatic writer."—*Naval and Military Gazette*.
Henry Colburn, Publisher, 13 Great Marlborough Street.

THE REV. SYDNEY SMITH.
In 3 vols. 8vo.
THE WORKS of the Rev. SYDNEY SMITH.

REVIEW OF NEW BOOKS.

A Diary in America, with Remarks on its Institutions. By Captain Marryat, C.B., author of "Peter Simple," "Jacob Faithful," &c. 3 vols. 12mo. London, 1839. Longman and Co.

THE well-known ability and far-extended experience of the author have excited much expectation from the announcement of this work, to which various collateral and extraneous, or accidental circumstances, have contributed. That he would not come forth as a *Peter Simple*, all were prepared to anticipate; and the only *a priori* thought entertained at home or in the United States was, whether he would or would not prove himself a *Jacob Faithful*. He protests that he is so; and after rising from his narrative, in which praise and censure are equally, and to all appearance impartially, blended, we see no reason to doubt the spirit of impartiality with which he has endeavoured to embody his impressions of the country and the people. In some cases his remarks are extremely astute. The following strikes us as being very sound:—

"There are many causes why those who have written upon America have fallen into error,—they have represented the Americans as a nation; now they are not yet, nor will they for many years be, in the true sense of the word, a nation,—they are a mass of many people cemented together, to a certain degree, by a general form of government; but they are in a constant state of transition, and (what may at first appear strange) no amalgamation has as yet taken place: the puritan of the east, the Dutch descent of the middle states, the cavalier of the south, are nearly as marked and distinct now, as at the first occupation of the country; softened down indeed, but still distinct. Not only are the populations of the various states distinct, but even those of the cities; and it is hardly possible to make a remark which may be considered as general to a country, where the varieties of soil and climate are so extensive. Even on that point upon which you might most safely venture to generalise, namely, the effect of a democratical form of government upon the mass, your observations must be taken with some exceptions, arising from the climate, manners, and customs, and the means of livelihood, so differing in this extended country. Indeed, the habit in which travellers indulge of repeating facts which have taken place, as having taken place in America, has, perhaps unintentionally on their part, very much misled the English reader. It would hardly be considered fair if the wilder parts of Ireland, and the disgraceful acts which are committed there, were represented as characteristic of England, or the British empire; yet between London and Connaught there is a less difference than between the most civilised and intellectual portion of America, such as Boston and Philadelphia, and the wild regions, and wilder inhabitants of the west of the Mississippi and Arkansas, where reckless beings compose a scattered population, residing too far for the law to reach; or where if it could reach, the power of the government would prove much too weak

to enforce obedience to it. To do justice to all parties, America should be examined and portrayed piecemeal, every state separately, for every state is different, running down the scale from refinement to a state of barbarism almost unprecedented; but each presenting matter for investigation and research, and curious examples of cause and effect."

A disposition to hoax travellers whom they expect to publish about them, is also noticed, as a source of some misrepresentations, by Captain M.; and the habit of concealing what might seem disagreeable adds to the causes of errors and false estimates. Of himself, Captain M. says:—

"If I admit that, after the usage which they had received, the Americans are justified in not again tendering their hospitality to the English, I cannot, at the same time, but express my opinion as to their conduct toward me personally. They had no right to insult and annoy me in the manner they did, from nearly one end of the Union to the other, either because my predecessors had expressed an unfavourable opinion of them before my arrival, or because they expected that I would do the same upon my return to my own country. I remark upon this conduct, not from any feeling of ill-will or desire of retaliation, but to compel the Americans to admit that I am under no obligations to them; that I received from them much more of insult and outrage than of kindness; and, consequently, that the charge of ingratitude cannot be laid to my door, however offensive to them some of the remarks in this work may happen to be."

He adds, "America is, indeed, well worth the study of the philosopher. A vast nation forming, society ever changing, all in motion and activity, nothing complete, the old continent pouring in her surplus to supply the loss of the eastern states, all busy as a hive, full of energy and activity. Every year multitudes swarm off from the east, like bees: not the young only, but the old, quitting the close-built cities, society, and refinement, to settle down in some lone spot in the vast prairies, where the rich soil offers to them the certain prospect of their families and children being one day possessed of competency and wealth. To write upon America as a nation would be absurd, for nation, properly speaking, it is not; but to consider it in its present chaotic state is well worth the labour. It would not only exhibit to the living a somewhat new picture of the human mind, but, as a curious page in the philosophy of history, it would hereafter serve as a subject of review for the Americans themselves. It is not my intention to follow the individualising plans of the majority of those who have preceded me in this country. I did not sail across the Atlantic to ascertain whether the Americans eat their dinners with two-prong iron or three-prong silver forks, with chopsticks or their fingers; it is quite sufficient for me to know that they do eat and drink; if they did not, it would be a curious anomaly which I should not pass over. My object was, to examine and ascertain what were the effects of a democratic form of government and climate upon a people which, with all its

foreign admixture, may still be considered as English.

"Upon one point I have made up my mind, which is that, with all its imperfections, democracy is the form of government best suited to the present condition of America, in so far as it is the one under which the country has made, and will continue to make, the most rapid advances. That it must eventually be changed is true, but the time of its change must be determined by so many events, hidden in futurity, which may accelerate or retard the convulsion, that it would be presumptuous for any one to attempt to name a period when the present form of government shall be broken up, and the multitude shall separate and re-embody themselves under new institutions."

The Diary occupies the first, and two-thirds of the second volume: the remainder consists of remarks on the education, slavery, army, marine, government, religion, and other great questions, founded on the preceding personal investigations. From New York, our countryman went to Boston, Troy, Albany, Utica, Trenton, Niagara, Detroit, Lake Huron, Lake Superior, &c.; and staying a while in Canada, during the insurrection, returned to the United States, and visited Philadelphia, Washington, Lake Erie, Winnebago, Wisconsin, the Indians, Cincinnati, Lexington, Louisville, and other places not very orderly arranged, but sufficiently indicated to enable us to follow him in his routes and whereabouts.

Our first extract relates to the Shaking Quakers, of whom Captain M. speaks unfavourably. He tells us:—

"I went out to see the Shakers at Niskayuna. So much has already been said about their tenets that I shall not repeat them, further than to observe that all their goods are in common, and that, although the sexes mix together, they profess the vows of celibacy and chastity. Their lands are in excellent order, and they are said to be very rich. We were admitted into a long room on the ground-floor, where the Shakers were seated on forms, the men opposite to the women, and apart from each other. The men were in their waistcoats and shirt-sleeves, twiddling their thumbs, and looking awfully puritanical. The women were attired in dresses of very light striped cotton, which hung about them like full dressing-gowns, and concealed all shape and proportions. A plain mob cap on their heads, and a thick muslin handkerchief in many folds over their shoulders, completed their attire. They each held in their hands a pocket-handkerchief as large as a towel, and of almost the same substance. But the appearance of the women was melancholy and unnatural; I say unnatural, because it required to be accounted for. They had all the advantages of exercise and labour in the open air, good food and good clothing; they were not overworked, for they are not required to work more than they please; and yet there was something so pallid, so unearthly in their complexions, that it gave you the idea that they had been taken up from their coffins a few hours after their decease: not a hue of health, not a vestige of colour in any cheek or lip;—one cadaverous yellow tinge prevailed.

And yet there were to be seen many faces very beautiful, as far as regarded outline, but they were the features of the beautiful in death. The men, on the contrary, were ruddy, strong, and vigorous. Why, then, this difference between the sexes, where they each performed the same duties, where none were taxed beyond their strength, and all were fed and clothed? After a silence of ten minutes, one of the men of the community, evidently a coarse, illiterate person, rose and addressed a few words to the spectators, requesting them not to laugh at what they saw, but to behave themselves properly, &c., and then he sat down. One of the leaders then burst out into a hymn, to a jiggish sort of tune, and all the others joined chorus. After the hymn was sung they all rose, put away the forms on which they had been seated, and stood in lines, eight in a row, men and women separate, facing each other, and about ten feet apart; the ranks of men being flanked by the boys, and those of the women by the girls. They commenced their dancing by advancing in rows, just about as far as profane people do in *télé* when they dance quadrilles, and then retreated the same distance, all keeping regular time, and turning back to back after every third advance. The movement was rather quick, and they danced to their own singing of the following beautiful composition :

Law, law, de lawdel law,
Law, law, de law,
Law, law, de lawdel law,
Lawdel, lawdel, law—

keeping time also with the hands as well as feet, the former raised up to the chest, and hanging down like the fore-paws of a dancing bear. After a quarter of an hour they sat down again, and the women made use of their large towel pocket-handkerchiefs to wipe off the perspiration. Another hymn was sung, and then the same person addressed the spectators, requesting them not to laugh, and inquiring if any of them felt a wish to be saved—adding ‘Not one of you, I don’t think.’ He looked round at all of us with the most ineffable contempt, and then sat down; and they sang another hymn, the burden of which was—

‘Our souls are saved, and we are free
From vice and all iniquity.’

Which was a very comfortable delusion, at all events. They then rose again, put away the forms as before, and danced in another fashion. Instead of *télé*, it was *grande ronde*. About ten men and women stood in two lines in the centre of the room, as a vocal band of music, while all the others, two and two, women first and men following, promenaded round, with a short quick step, to the tune chanted in the centre. As they went round and round, shaking their paws up and down before them, the scene was very absurd, and I could have laughed had I not felt disgusted at such a degradation of rational and immortal beings. This dance lasted a long while, until the music turned to croaking, and the perspiration was abundant; they stopped at last, and then announced that their exercise was finished. I waited a little while after the main body had dispersed, to speak with one of the elders. ‘I will be with you directly,’ replied he, walking hastily away; but he never came back. I never heard the principle upon which they dance. David danced before the ark; but it is to be presumed that David danced as well as he sung. At least he thought so; for, when his wife Michal laughed at him, he made her conduct a ground of divorce. Every community which works in common, and is provided for in the mass, must become rich, especially when it has

no children to maintain. It is like receiving a person’s labour in exchange for victuals and clothing only, and this is all I can perceive that can be said in favour of these people. Suffice it to say, I have a very bad opinion of them: and were I disposed to dilate on the subject, I should feel no inclination to treat them with the lenity shewn to them by other travellers.”

At Sault St. Marie, we are informed “there are two companies of soldiers quartered here. The rapids from which the village takes its name are just above it; they are not strong or dangerous, and the canoes descend them twenty times a-day. At the foot of the rapids the men are constantly employed in taking the white fish in scoop nets, as they attempt to force their way up into Lake Superior. The majority of the inhabitants here are half-breeds. It is remarkable that the females generally improve, and the males degenerate, from the admixture of blood. Indian wives are here preferred to white, and perhaps with reason—they make the best wives for poor men; they labour hard, never complain, and a day of severe toil is amply recompensed by a smile from their lord and master in the evening. They are always faithful and devoted, and very sparing of their talk, all which qualities are considered as recommendations in this part of the world.”

Intending to resume this work, and being called on by a variety of novelties this week, we shall now conclude with a few specimens, which the Captain has facetiously thrown in to lighten the discussion of graver points.

“The Americans delight in the hyperbole; in fact, they hardly have a metaphor without it. During this crash, when every day fifteen or twenty merchants’ names appeared in the newspapers as bankrupts, one party, not in a very good humour, was hastening down Broadway, when he was run against by another whose temper was equally unamiable. This collision roused the cholera of both. ‘What the devil do you mean, sir?’ cried one; ‘I’ve a great mind to knock you into the middle of next week.’ This occurring on a Saturday, the wrath of the other was checked by the recollection of how very favourable such a blow would be to his present circumstances. ‘Will you?’ by Heavens, then pray do; it’s just the thing I want: for how else I am to get over next Monday, and the acceptances I must take up, is more than I can tell.”

“There certainly is a very remarkable energy in the American disposition; if they fall, they bound up again. Somebody has observed that the New York merchants are of that elastic nature, that, when fit for nothing else, they might be converted into coach-springs; and such really appears to be their character.”

“The radicals here, for there are radicals, it appears, in a democracy—

‘In the lowest depth, a lower deep’—

are very loud in their complaints. I was watching the swarming multitude in Wall Street this morning, when one of these fellows was declaiming against the banks for stopping specie payments, and ‘robbing a poor man in such a villanous manner,’ when one of the merchants, who appeared to know his customer, said to him, ‘Well, as you say, it is hard for a poor fellow like you not to be able to get dollars for his notes: hand them out, and I’ll give you specie for them myself!’ The black-guard had not a cent in his pocket, and walked away looking very foolish. He reminded me of a little chimney-sweeper at the Tower Hamlets election, asking—‘Vot vos my hoplions

about primaginitur?’—a very important point to him, certainly, he having no parents, and having been brought up by the parish.

“I had a genuine Yankee story from one of the party on deck. I was inquiring if the Hudson was frozen up or not during the winter? This led to a conversation as to the severity of the winter, when one man, by way of proving how cold it was, said—‘Why I had a cow on my lot up the river, and last winter she got in among the ice, and was carried down three miles before we could get her out again. The consequence has been, that she has milked nothing but ice-creams ever since.’

“I must notice the prodigious size of the lobsters off Boston Coast: they could stow a dozen common English lobsters under their coats of mail. My very much respected friend, Sir Isaac Coffin, when he was here, once laid a wager that he would produce a lobster weighing thirty pounds. The bet was accepted, and the admiral despatched people to the proper quarters to procure one: but they were not then in season, and could not be had. The admiral, not liking to lose his money, brought up, instead of the lobster, the affidavits of certain people that they had often seen lobsters of that size and weight. The affidavits of the deponents he submitted to the other party, and pretended that he had won the wager. The case was referred to arbitration, and the admiral was cast, with the following pithy reply, ‘Depositions are not lobsters.’”

At Mackinaw. “I inquired if people lived to a good old age in the island; his reply was quite American—‘I guess they do; if people want to die, they can’t die here—they’re obliged to go elsewhere.’

“Progressing in the stage, I had a very amusing specimen of the ruling passion of the country—the spirit of barter, which is communicated to the females as well as to the boys. I will stop for a moment, however, to say, that I heard of an American who had two sons, and he declared that they were so clever at barter, that he locked them both up together in a room, without a cent in their pockets, and that before they had swooped for an hour, they had each gained two dollars a-piece. But now for my fellow-passengers—both young, both good-looking, and both ladies, and evidently were total strangers to each other. One had a pretty pink silk bonnet, very fine for travelling; the other, an indifferent plash one. The young lady in the plush eyed the pink bonnet for some time: at last Plush observed in a drawing, half-indifferent way: ‘That’s rather a pretty bonnet of yours, miss.’ ‘Why yes, I calculate it’s rather smart,’ replied Pink. After a pause, and closer survey—‘You wouldn’t have any objection to part with it, miss?’ ‘Well now, I don’t know but I might; I have worn it but three days, I reckon.’ ‘Oh, my! I should have reckoned that you carried it longer—perhaps it rained on them three days.’ ‘I’ve a notion it didn’t rain not one.—It’s not the only bonnet I have, miss.’ ‘Well now, I should not mind an exchange, and paying you the balance.’ ‘That’s an awful thing that you have on, miss.’ ‘I rather think not, but that’s as may be.—Come, miss, what will you take?’ ‘Why I don’t know,—what will you give?’ ‘I reckon you’ll know best when you answer my question.’ ‘Well, then, I should’nt like less than five dollars.’ ‘Five dollars and my bonnet!’ I reckon two would be nearer the mark—but it’s of no consequence.’ ‘None in the least, miss, only I know the value of my bonnet.—We’ll

say no more about it.' 'Just so, miss.' A pause and silence for half a minute, when Miss Plush looks out of the window, and says, as if talking to herself, 'I shouldn't mind giving four dollars, but no more.' She then fell back in her seat, when Miss Pink put her head out of the window, and said, 'I should not refuse four dollars after all, if it was offered,' and then she fell back to her former position. 'Did you think of taking four dollars, miss?' 'Well! I don't care, I've plenty of bonnets at home.' 'Well,' replied Plush, taking out her purse, and offering her the money. 'What bank is this, miss?' 'Oh, all's right there; Safety Fund; I calculate.' The two ladies exchange bonnets, and Pink pockets the balance."

The Forester; a Tale of 1688. By Mary L. Boyle. 3 vols. 12mo. London, 1839. Longman and Co.

WITH some of the inaccuracies of a young writer, and a tendency to redundant local descriptions, there are high redeeming qualities in this *Tale of 1688*. The whole-length portraits of James II. and his Queen, Mary of Modena, especially the latter, are drawn, not only with a sweet sympathy, always given by the sex to misfortune, but also with more historical truth and force than could have been expected from either a youthful or unpractised author: and thus an extraordinary interest is created for those for whom we had supposed it impossible to re-create one new human sympathy. The famous Duke of Marlborough is also exhibited with much talent and appreciation of character; while the supposititious personages, Lord Fleming, Mary Savile, Sir Philip Dudley, and his mysterious sister Jane, are invented with all the skill of an experienced novelist. Some of the inferior people are not less ably portrayed: the touching sketch of Amy, the "flower of the forest," and the interpositions of her father the woodman, are pathetically and ingeniously wrought in to set off the higher affairs; and events of civil war, the royal abdication, and all the rest to the battle of the Boyne, are so well described, that the general canvass would not discredit the hand of a master, as it certainly does much honour to that of a fair lady-artist.

As the relation follows the course of actual history, we need not trouble ourselves with tracing it; but, even in this light, the following unpublished document will excite much interest. When James was stopped on the high seas, and carried back a prisoner to Feversham, the council of government, with Lord Halifax as speaker, and Lord Mulgrave as president, was sitting at Whitehall, and Miss Boyle proceeds,—

"When the news of the king's detention at Feversham reached the capital, but before they could discuss the subject fully, a young countryman made his way, in spite of all opposition, to the very door of the apartment where the assembly was held. He announced himself as the messenger of the king of England, but there were many present who no longer acknowledged James by that title. The perfidious and time-serving Halifax, dreading the effect that any appeal from their unfortunate sovereign might produce on the minds of his coadjutors, proposed, without ceremony, to break up the council. But Lord Mulgrave strenuously opposed this proceeding, and by bold and manly exhortation, persuaded his companions to remain, while the lowly ambassador of James the Second was introduced. The man looked around with surprise and awe

upon a scene so novel, and then, encouraged by the cheering condescension of Lord Mulgrave, he presented the letter, which bore no address. 'His majesty,' he said, while tears flowed down the rough cheeks of the young peasant, 'had intrusted him with that paper, desiring it might be delivered to a friend.' Alas! there were but few present who were anxious even to lay claim to that title. The president, with some marks of emotion, beckoned the man towards him, and in as steady a voice as he could command, read to the following effect:—

"Feversham, December 19, 1688.

"I had the misfortune to be stooped at Schellness, and brought in here, by a rabble of seamen, fishermen, and others, who still detain me here tho' they know me. Lord Winchelsea came to me here, but too late. But if those who detain me would let me go to Canterbury, I would not have cared: I must see if that I could not persuade them to permit it to-morrow; however, speak to some of my servants to come to me, and bring with them some linnen and cloaths; and if Fraser be in the way let him be one: direct them to come by Sittingburne, and go by this place on to Canterbury, if I be not here. I know not if this letter will get to you safe, and so say no more. Let James Graham know I shall want some money; if he could come and bring some himself, or send some, it would be but necessary, those who seized me having taken all the little I had about me, when they layed hands upon me.

'J. R.

'December 13th.

"This letter should have gone last night, but the person who was to carry it was frightened, so that he dared not shew out of this inn, being stooped and frightened. I hope he that carries it now will get through to you, tho' all the whole country are up, and have plundered most of the Catholics' houses."

"When Lord Mulgrave concluded this affecting appeal, he looked around in silence, believing that few of his associates could remain insensible to the distress and humiliation of a man whom they had once hailed as their king. But he was mistaken; for the space of several minutes the silence was unbroken, until Lord Halifax, in his office of speaker, murmured something about the regret that must ever be excited even by the misfortunes of those who suffered for their own errors; and then further remarking that the interference of the assembly in this business would be both ill-advised and ill-timed, he again proposed that the council should adjourn."

This is a curious letter, and Miss Boyle has made excellent use of it. But we have alluded to some of her faults, and ought to justify our gentle censure. They seem to arise out of the floridness of the descriptions: thus, page 3, vol. i. "In a deep recess of that window stood two persons, engaged in earnest conversation," &c.; and, in the very next passage, page 4, it is written, "But we have dwelt so long on these particulars, as might lead to the belief, that she stood in the window alone." Again, "Lord Fleming was proud, but his pride was under subjection, even though it sprang from conscious rectitude," p. 39. And why not? It was the more likely to be under subjection on that very account.

Many of the reflections of the writer breathe of her period of life; but there are a number which are almost extraordinary from so young an observer. The heroine has pledged her

vows; and the queen, with whom she is a favourite,

"Stooped forward, and kissing her young friend gently on the brow, exclaimed—'So those important words have been pronounced—those words which exercise a magic influence over the whole of our after-life! Did it never strike you, Mary, how lightly the generality of the world esteem and consider the most awful step which a woman is called upon to take in life? Until that moment, she may never have been placed in a situation which entailed the necessity of important decision; until that moment (particularly if her hand be solicited at an early period), every act of her young life, however trifling, has been probably influenced by others. With men it is a very different case: they are early under the obligation of thinking and acting for themselves; as children they enter on the stage of the world, and are compelled to be actors in its scenes: they are brought by degrees in contact with their fellow-performers, and imperceptibly acquire a comprehension of the part they may have to play in the more stirring incidents of the drama. But woman is not unfrequently hurried from utter seclusion, without any such preparation, and abruptly required to assume a new character, and to perform a most arduous part on the theatre of her own destiny, while the novelty of her situation is calculated to bewilder as well as to dazzle her.'"

The sacking and destruction of the gaol at Marlborough are told with great animation; though perhaps the colloquies within the walls are too long for the circumstances. Nevertheless, we conclude with one of the scenes:—

"In crossing one of the courts, however, Morice perceived a concourse of people flocking in one direction, and with loud vociferations inviting every one to assist in hunting the old governor out of his hiding-place. Morice joined the crowd, and gathered from the language of those who surrounded him, that they were bent on the destruction of the man he sought; while one or two frequently turned to urge the others forward, assuring them 'that they would be too late for the sport.' The forester looked round in silence, hoping to discover some of his friends among the crowd, but it was for the most part composed of liberated prisoners, and those who were connected with them; they hastened on through several passages, and up a winding staircase, into a small tower, where a room was situated immediately below the leads. There were sounds proceeding from that room which caused Morice to push forward even more eagerly than before, and forcing open the door, he found himself in an apartment much larger than is usually found in a prison, which had probably once served as an oratory; at least so it appeared, for an iron lamp was suspended from the ceiling, which burned night and day, and now served to discover a scene of horror. Across the threshold was stretched the body of a soldier, who had been killed in defending his post; an officer lay not far distant, apparently in the agonies of death; but at the other end, was a sight even more calculated to arrest the eye. Two ruffians were occupied in binding the arms of a fine old man, in a full military dress, whose long gray hair might have claimed some pity and respect at the hands of the most hardened; while a third stood guard over a lovely boy, apparently about fourteen years of age. There was a marked resemblance in the features of the father and the son, but a strong contrast in their demeanour; the old man submitted in silence, listening to every insulting threat with a scornful smile, that

* "This interesting document is in the possession of the Earl of Cork and Ormoy, by whose kind permission it is inserted here."

kindled his gray eye, and added to the dignity of his whole aspect; it was only when they coupled their menaces with the name of his son, the child of his old age, that the veteran's cheek betrayed the fear which was unfamiliar to his nature. The demeanour of the boy was of that uneven character which might be expected at an age when the lofty spirit, scarcely developed, struggles with the yet lingering timidity of childhood. At one moment, with the tears streaming down his young cheeks, he would call upon his persecutors, with the voice of an angel, to have pity upon his father; to unbind his limbs and set him free; at the next, he strove to advance towards the governor, while the coward who pinioned those slender arms, raised his clenched fist, and striking the gallant boy, caused his tears to be dried in an instant, brought the crimson blood into his cheeks, and lit the eye, which but a moment before was overflowing with sorrow. Then he would stamp his small foot upon the ground, and exasperate the wretches in whose power he was, by heaping on them every opprobrious epithet. No sooner was the door opened, and his eyes fell upon the forester, than a ray of hope cast itself over his features. There was something in the appearance of Hubert Morice that seemed to promise protection; and turning quickly round, he entreated him to deliver his father. This appeal was rewarded by a blow, which caused Morice to lay him who gave it prostrate at the feet of the boy. The men who were binding the governor's arms turned their heads abruptly; while those who had entered at the same time as Morice, stood suspended between surprise and anger."

The whole is well given, and we are sorry we have not room for it; and can only recommend these volumes to the lovers of the historical class of novels, to which, by consistent fiction, it imparts another interest, and teaches us to feel for imagined as well as real sufferings.

Songs and Poems. In Three Parts. By Thomas Tod Stoddart, Esq., author of the "Death Wake," "Scottish Angler," &c. 8vo. pp. 216. Edinburgh, 1839. Blackwood and Sons.

MANY of these songs are excellent, especially those in the first part, which treat upon the gentle craft of angling. There is a heartiness about them; and we could almost fancy, whilst reading, that we heard the voices of the "jolly fishermen" swelling out the loud chorus. The wind blows, the river flows, the trees wave, and the hawthorn sends its healthy aroma along the pages, and we are borne away to flowery slopes and rustling sedges, where the pointed reeds rattle against each other, and the drooping water-flags whisper and wave beside the stream. But we must let our readers partake of the pleasure which the volume has afforded us; and, without further apology, shall select a sweet stave or two from the work.

"O Waken, Winds, Waken!"

O waken, winds, waken! the waters are still,
And silence and sunlight recline on the hill;
The angler is watching, beside the green springs,
For the low welcome sound of your wandering wings!

His rod is unwielded, his tackle unfreed,
And the withe-woven pannier lies flung on the mead;
He looks to the lake, through its fane of green trees,
And sighs for the curl of the cool summer breeze.

Calm-bound is the form of the water-bird fair,
And the spear of the rush stands erect in the air,
And the dragon-fly roams o'er the lily-bed gay,
Where basks the bold pike in a sun-amitten bay.

O waken, winds, waken! wherever asleep;
On cloud, or dark mountain, or down in the deep;
The angler is watching, beside the green springs,
For the low welcome sound of your wandering wings."

"I've Angled Far, &c.

I've angled far and angled wide,
On Fannich dree, by Luichart's side,
Across dark Conan's current;
Have haunted Beauty's silver stream,
Where glimmering thro' the forest Dream
Hangs its eternal torrent;

Among the rocks of wild Marae,
O'er whose blue billow ever free
The daring eagles hover,
And where, at Glomach's ruffian steep,
The dark stream holds its angered leap,
Many a fathom over;

By Lochy sad, and Laggan lake,
Where Spey uncoils his glittering snake
Among the hills of thunder;
And I have swept my fatal fly,
Where swarthy Findhorn hurries by
The olden forest under;

On Tumme's solitary bed,
And where wild Tilt and Garry wed
In Athol's heathery valleys,
On Eard by green Dunelra's bower,
Below Breadalbane's Tay-washed tower,
And Scone's once regal palace.

There have I swept the slender line,
And where the broad Awe braves the brine,
Have watched the gray grilse gambol,
By nameless stream and tarn remote,
With light flies in the breeze aloft,
Holding my careless ramble.

But dearer than all these to me
Is Sylvan Tweed; each tower and tree
That in its vale rejoices!
Dearer the streamlets one and all,
That blend with its Eollian brawl
Their own enamouring voices!"

"The Breeze is on, &c.

The breeze is on the Heron lake,
The May sun shineth clear;
Away we bound through the broomy brake,
With our wands and angling gear.

The birch-wreath o'er the water edge
Scatters sweet flies about,
And round his haunt of sighing sedge
Bells up the yellow trout.

Beware! beware! his eye is bright,
As falcon's in the sky;
But artful feather hove aright,
Will hood a keener eye.

Beware! beware the water weed
And the birch that waves behind;
And gently let the good line speed
Before thee on the wind.

Oh! gently let the good line flow,
And gently wile it home;
There's many a gallant fin, I trow,
Under the ribbed foam.

A merry fish on a stallion lead
'Tis a pleasant thing to hear
On May-days, when the cownail fair
Is blooming on the mead.

When the breeze is up, and the sun is out,
And gray flies buzz or thrush
Sport in the noontide round about
The shadow of a tree.

Oh! then the heart bounds pleasantly,
And its thoughts are pleasant things,
Gushing in joyous purity,
Like silent water-springs!"

"The Angler's Invite.

Come when the leaf comes, angle with me,
Come when the bee hums over the lee,
Come with the wild flowers—
Come with the mild showers—

Come when the singing bird calleth for thee!
Then to the stream side gladly we'll lie,
Where the gray trout glide silently by,
Or in some still place

Over the hill face
Hurrying onward, drop the light fly.
Then when the dew falls, homeward we'll speed
To our own loved walls down on the mead,
There, by the bright hearth,
Holding our night mirth,

We'll drink to sweet friendship in need and in deed."

Continental Fragments. By C. R. Weld. 8vo. pp. 92. Dublin, 1839. Hardy and Walker. London, Groombridge.

MANY of these *Fragments* are very beautiful; some of them truly poetical; and what enhances their value is, that they are put forth without any vain pretence. True, the author has gone over much of the ground which Rogers and Byron have trodden before; nor can the mind divest itself of what they have done while perusing his pages. But, setting all

these matters aside, his is a work of great merit; the author thinks and feels rightly, and has set about his task with the true spirit: there is no bombast, no inflation about his style, no big-bouncing, unmeaning nothingnesses. Read the following, to judge:—

"Père is Chaise.

I would not care to call that man my friend,
Who could view all these victories of death—
The many tombs and monuments so dear
To parents, friends, and relatives—unmov'd.

'Tis a strange melancholy feel to walk
With death on every side;—to see each tomb
Inscrib'd with names and words of deep, deep grief.
And there are some which call from every breast
A sympathising sigh."

None but a true poet could have penned these few lines; if any one had recited them to us, and we been ignorant of the author's name, we should have attributed them to Wordsworth. Amid so many short but beautiful pieces, we are puzzled to make an extract: we shall therefore give the following, for no other reason than that it was the last we read:—

"Juliet's Tomb, Verona.

And this was Juliet's tomb;—this antique shell,
Of coardest marble, held that once fair form;
Here was she laid, and here the lamp was placed;
And at the side and foot were two square holes,
Through which the gentle and reviving air
Might pass, softly to wake again to life,
Though not to love, the prison'd slumberer.

It stands within a mould'ring court-yard,
And rests on one stone step, overgrown with moss.
An old and feeble woman spends her days
In caring it, and gains a scanty sum
By shewing it to curious travellers:
Yet has she too, withal, an honest pride;
And as she lifts her wand to point it out,
I envy not the man could doubting hear,
And leave the spot without a passing sigh.

The garden held it once, a wild of weeds,
And tangled shrubs, a lone neglected place,
Meat to enclose a relic, o'er which hangs
Such sad remembrances of wither'd things,
And hopes of youth, all blighted in the bud.
But pilfering strangers, worse than gnawing time,
Urged by the keen desire to possess,
Were wont to treasure up the smallest piece,
Which taken by itself were never mis'd;
But by degrees these thefts began to shew,
And bit by bit was broken off, until
A yawning gap disclosed the sacrilege:
So busy were the hands of curious men,
Yet, there was some excuse; and to thy muse,
Immortal Shakspere, it was homage paid,
For thou hast shed a magic o'er the place,
Which will exist while time shall hold its sway."

Travels in North America, during the Years 1834, 5, 6. Including a Summer Residence with the Pawnee Tribe of Indians, in the remote Prairies of the Missouri; and a Visit to Cuba and the Azore Islands. By the Honourable C. Augustus Murray. 2 vols. 8vo. London, 1839. Bentley.

BRED and trained among the invigorating mountains of the Scottish highlands; accustomed to mount to the craggy heights of the ptarmigan, and stalk the fleet and wary red deer among his fastnesses, Mr. Murray was just the sort of person to undergo the fatigues of prairie travel, and shew the Pawnees themselves that the lap of European luxury had not caused the sturdy race of Caledonia to degenerate. His activity and his rifle, his courage and his firmness, were rather superior than inferior to the standard of the children of nature with whom he ranged; and we rise from the account of his difficulties, dangers, and exploits, perfectly satisfied with the figure our representative of the white cut among the hunters and warriors of the red.

As we do not find much in the writer's remarks upon the various parts of the United States which he visited that calls for observation, as differing from the accounts of other travellers, and presenting novelty of subject, we shall go at once to the more original

matter, and set ourselves down with the Pawnees, with whom we have started from Fort Leavenworth, the most distant on the American frontier:—

"Every hour (he says) that I spent with the Indians, impressed upon me the conviction that I had taken the only method of becoming acquainted with their domestic habits and their undisguised character. Had I judged from what I had been able to observe at Fort Leavenworth, or other frontier places, where I met them, I should have known about as much of them as the generality of scribblers and their readers, and might, like them, have deceived myself and others into a belief in their 'high sense of honour'—their hospitality—their openness and love of truth, and many other qualities which they possess, if at all, in a very moderate degree; and yet it is no wonder if such impressions have gone abroad, because the Indian, among whites, or at a garrison, trading-post, or town, is as different a man from the same Indian at home as a Turkish 'mollah' is from a French barber. Among whites, he is all dignity and repose; he is acting a part the whole time, and acts it most admirably. He manifests no surprise at the most wonderful effects of machinery—is not startled if a twenty-four-pounder is fired close to him, and does not evince the slightest curiosity regarding the thousand things that are strange and new to him; whereas at home, the same Indian chatters, jokes, and laughs among his companions—frequently indulges in the most licentious conversation; and his curiosity is as unbounded and irresistible as that of any man, woman, or monkey, on earth. Truth and honesty (making the usual exceptions to be found in all countries) are unknown, or despised by them. A boy is taught and encouraged to steal and lie, and the only blame or disgrace ever incurred thereby is when the offence is accompanied by detection. I never met with liars so determined, universal, or audacious. The chiefs themselves have told me repeatedly the most deliberate and gross untruths, to serve a trifling purpose, with the gravity of a chief-justice; and I doubt whether Baron Munchausen himself would be more than a match for the great chief of the Pawnees. Let them not dispute the palm—each is greatest in his peculiar line—one in inventive exaggeration, the other in plain unadorned falsehood."

The dandyism of the youthful Pawnees is superb:—

"About the age of twenty they are allowed to hunt, and seek other opportunities for distinction. This epoch answers to the Oxonian's first appearance in London life after taking his B.A. degree. I have seen some dandies in my life—English, Scotch, French, German, ay and American dandies too; but none of them can compare with the vanity or coxcombry of the Pawnee dandy. Lest any of the gentry claiming this distinction, and, belonging to the above-mentioned nations, should doubt or feel aggrieved at this assertion, I will faithfully narrate what passed constantly before my eyes in our own tent; namely, the manner in which Sâ-ni-tâ-riah's son passed the days on which there was no buffalo hunt. He began his toilet, about eight in the morning, by greasing and smoothing his whole person with fat, which he rubbed afterwards perfectly dry, only leaving the skin sleek and glossy; he then painted his face vermilion, with a stripe of red also along the centre of the crown of the head; he then proceeded to his 'coiffure,' which received great attention, although the quantum of hair demanding such care was limited, inasmuch as

his head was shaved close, except one tuft at the top, from which hung two plaited 'tresses.' (Why must I call them 'pig-tails'?) He then filled his ears, which were bored in two or three places, with rings and wampum, and hung several strings of beads round his neck; then, sometimes painting stripes of vermilion and yellow upon his breast and shoulders, and placing armlets above his elbows and rings upon his fingers, he proceeded to adorn the nether man with a pair of moccasins, some scarlet cloth leggings fastened to his waist-belt, and bound round below the knee with garters of beads four inches broad. Being so far prepared, he drew out his mirror, fitted into a small wooden frame (which he always, whether hunting, or at home, carried about his person), and commenced a course of self-examination, such as the severest disciple of Watts, Mason, or any other religious moralist, never equalled. Nay more, if I were not afraid of offending the softer sex by venturing to bring man into comparison with them in an occupation which is considered so peculiarly their own, I would assert that no female creation of the poets, from the time that Eve first saw 'that smooth watery image,' till the polished toilet of the lovely Belinda, ever studied her own reflected self with more perseverance or satisfaction than this Pawnee youth. I have repeatedly seen him sit, for above an hour at a time, examining his face in every possible position and expression; now frowning like Homer's Jove before a thunder-storm, now like the same god, described by Milton, 'smiling with superior love'; now slightly varying the streaks of paint upon his cheeks and forehead, and then pushing or pulling 'each particular hair' of his eyebrows into its most becoming place! Could the youth have seen any thing in that mirror half so dangerous as the features which the glassy wave gave back to the gaze of the fond Narcissus, I might have feared for his life or reason; but, fortunately for these, they had only to contend with a low receding forehead, a nose somewhat simious, a pair of small sharp eyes, with high cheek-bones, and a broad mouth, well furnished with a set of teeth, which had at least the merit of demolishing speedily every thing, animal or vegetable, that came within their range. His toilet thus arranged to his satisfaction, one of the women or children led his buffalo-horse before the tent; and he proceeded to deck his steed by painting his forehead, neck, and shoulders, with stripes of vermilion, and sometimes twisted a few feathers into his tail. He then put into his mouth an old-fashioned bridle, bought or stolen from the Spaniards, from the bit of which hung six or eight steel chains, about nine inches long; while some small bells, attached to the reins, contributed to render the movements of the steed as musical as those of the lovely 'Sonnante' in the incomparable tales of Comte Hamilton. All things being now ready for the promenade, he threw a scarlet mantle over his shoulders; thrust his mirror in below his belt; took in one hand a large fan of wild-geese or turkey fea-

thers, to shield his fair and delicate complexion from the sun; while a whip hung from his wrist, having the handle studded with brass nails. Thus accoutred, he mounted his jingling palfrey, and ambled through the encampment, envied by all the youths less gay in attire, attracting the gaze of the unfortunate drudges who represent the gentler sex, and admired supremely by himself!"

Poor Bond Street, and miserable Hyde Park!

Hunting the buffalo, was the great aim and object of the tribe with whom Mr. Murray resided; and his adventures in these expeditions would have done honour to Nimrod. On one occasion he relates:—

"I was determined not to let the sun set upon my blood-guiltless head; and, as it was only about two P.M., I mounted another horse, took my rifle, and again set out in quest of adventures. I soon found a bull in a neighbouring ravine, slightly wounded by an arrow in his flank; and, as he was near the village, a large party of women and children were answering, at a respectful distance, his roaring and bellowing by their shouts and cries. They told me to go and kill him. As the horse I had then mounted would not allow me to shoot from his back, I dismounted, and shot a bullet into the bull's shoulder; after a short interval, he tottered and fell. I thought that he was just about to die, and imprudently walked up nearer to him. To my surprise, he sprang up and made at me; I waited till he came within two or three yards, then fired my second barrel, and jumped on one side. He passed over the place I had ceded to him, and, after staggering on a short distance, he fell again. I reloaded my rifle, and was obliged to fire another ball, which put him out of his pain; and then I left him to the tender mercies of the women and children, and, mounting my horse, cantered over the hills in search of more game. I was soon aware of a fine bull, enjoying its solitary range at the distance of a quarter of a mile. I gave chase, and, after a gallop of two or three miles, I came alongside the enemy; but my Indian nag would not allow me to shoot off his back; the moment I presented my rifle, he would wheel and jump, so as to preclude all possibility of taking aim. The bull chased me about fifty yards, but, finding he had no chance of overtaking me, stopped and stamped. I dismounted, and a pitched battle now ensued, in which Purday's double-barrel ultimately gained the day; but I never met with an animal so tenacious of life. He did not fall till he received my fourth ball in the heart; two having pierced him before, not more than three inches from the heart, and one having entered his eye, which I aimed at, in the expectation of thereby reaching his brain. I now returned to the camp, satisfied with my day's sport. I might have killed three times as many with half the trouble, had I chosen to remain with the chiefs in the centre of the 'cerne,' and assist in the medley massacre; but I could see no sport or excitement in a scene resembling too closely the shambles: besides which, it is impossible to have the undivided glory, as the greater number are pierced by three or four arrows, and you must either kill some other hunter's wounded buffalo, or let him kill what you have wounded; neither of which alternatives a sportsman would choose to adopt. I cannot say exactly the amount of the day's slaughter, but it was between five and six hundred. . . . And here (he afterwards observes) I may remark, that the bow and arrow is, beyond all question, the most effective weapon for killing buffalo; it would

* "The fashion of wearing the hair varies in every tribe, and in every individual of the tribe, according to the fancy of the person; but the method here described is the most prevalent among the Pawnees. The Ricaras plait a long stream of horsehair with their crown-tuft, which floats wildly in the breeze as they gallop, and gives them a terrible and picturesque appearance. I have also been informed by many of the Rocky Mountain traders, that some of the Crow chiefs (a nation to the north-west of the Ricaras) wear hair of seven and eight feet long; and a gentleman of character and education assured me that he had measured the hair of one of them nine feet. Like the faithful old Herodotus, I add, 'These things I have not seen, but give them as they were told to me.'"

be so even in the hands of an indifferent archer, because it is only necessary to have a well-trained horse, who is sufficiently fleet to overtake the game, but who will not pass them, so as to incur the danger of their formidable horns; the hunter may then gallop up behind them, keeping always on their right flank, so as to have the free use of his bow, and, when within five or six yards, shoot one or two arrows into the loins in the oblique direction, which the relative position of the parties renders easy and almost unavoidable. Even if, as I before said, the archer be but an indifferent one, and the arrows only enter four or five inches into the flank, every motion that the poor animal makes brings some new portion of his wounded interior in contact with the sharp arrow-head, and he soon seeks relief in standing still, when he is either left to a slow and lingering death, or becomes an easier mark for a deliberate aim. But, with the Pawnees, at least among the *braves* and warriors, it is very rare that only a few inches of the arrow enter; on the contrary, unless it strike full upon a rib-bone, it generally penetrates two-thirds of its length, and is often buried up to the feathers; indeed, I have seen the greater part of the feathers buried also, and have been assured by many, both Indians and white traders, that they have frequently known an arrow to be sent clean through a buffalo, and to stick into the ground; this last I never saw, but I can believe it. In shooting these animals with ball the risk is much greater, for, when wounded, they feel less pain in motion than in remaining still; and, therefore, they gallop either away from, or in pursuit of, the hunter, until they receive the mortal shot. I cannot convey any just impression of the total dependence of the remote western tribes on buffalo, for their very existence, without giving a sketch of the various purposes for which that animal is, by their ingenuity, rendered available. First, its flesh is their principal, sometimes their only, food; eaten fresh on the prairies during their hunt, and dried, in their winter villages. Secondly, the skin is put to various uses; it forms the material of their lodges, of their bales for packing the meat, of their bed by night, and their clothing by day; the coarser parts they make into saddles, or cut into laryettes, or halters; and, more than all, it is now their chief article of trade with the whites, and thus is the source whence they must derive blankets, knives, beads, and every other produce of civilisation. Thirdly, they use the sinews as strings to their bows, and the smaller fibres instead of twine or thread; the brains serve to soften and dress the skins; while (as is elsewhere noted in this journal) the hoof, at the end of the shank-bone, is made to answer the purpose of a mallet. Fourthly, the bones are not less useful; some of them being serviceable as scrapers, or coarse chisels; others are pointed, and used with the finer fibres as needle and thread; and the ribs, strengthened by some of the stronger fibres, are made to furnish the bow with which other buffalo are to be destroyed: this last is the triumph of Indian ingenuity. The first bow that I saw constructed in this manner caused so much

surprise and admiration, that I offered nearly the value of a horse for it, but was refused. When I add to the foregoing particulars, that on the barren prairies the Indians frequently depend upon the buffalo for their fuel, and on its bladder for the means of carrying water, it will not be denied that the animal is essential to their existence; and where the buffalo is exterminated, the Indian of the prairies must perish."

We shall only quote one of Mr. Murray's *djéinés*, not *à la fourchette*, and close these volumes; leaving, as we have mentioned all the rest, out of the Pawnee camp, to the readers of the work, who will find it full of incident and entertainment.

"As I trotted over the plain, I began to feel the cravings of hunger almost to a painful degree; which is not to be wondered at, as I had been twelve hours in hard exercise, without rest, and had eaten nothing on the preceding day. After riding a few miles further, I saw a small herd: upon giving chase, a young bull fell behind the rest, being so fat that he could not keep up with them. After running them a considerable distance, we came to a very narrow steep ravine; and, as I saw the leaders cross directly up the opposite side, I knew that the fat gentleman would follow them as well as he was able. Accordingly, I dismounted, examined my caps, and prepared for a comfortable shot. When all the rest had disappeared over the opposite brow, he toiled lazily up the ascent. As soon as he was exactly in the place where I wished him to be, and not more than forty yards off, I fired. He turned instantly, gave me a fierce look, and began to run straight towards me: but the ball had been too true; he required no second, and rolled dead into the ravine below. I now hobbled my horse, took off my jacket, tucked up my sleeves, drew my knife, and prepared to make my *coup d'essai* as a butcher. Previously to eating my savage and solitary meal, I looked around. There was not a human being in sight to assist me in turning over the body, which is hard work for two ordinary men, but impossible for one: so I was obliged to content myself with skinning only one side. My knife was not very sharp, and those only who have seen and proved the skin of this hairy monster can judge of the labour of the task. After an hour's unremitting work I succeeded, and then went on to open the body. Without much difficulty I got at the liver, and began to eat, certainly more like a wolf, or Indian, than a Christian man. After devouring several large morsels, I saw a hunter coming towards me at full speed. He had been unsuccessful, and was hungry. I was nearly choked with thirst, and, as soon as he arrived, made him signs, that if he would fetch me water, I would give him as much to eat as he chose. He nodded assent. We then took out the bladder of the buffalo; I told him to wash it well, and bring it back full of clear water. He went off at a gallop, and, in about a quarter of an hour, came back, having executed his commission. I cannot say that the water was quite crystal; but I never enjoyed a more delicious meal than this raw liver, and the water, such as it was. The Indian also shewed me two or three other morsels, which I found excellent; and I strongly recommend to any gentleman who may ever find himself similarly situated, to break a bone, and suck the marrow."

The Lion; a Tale of the Colonies. 3 vols.

12mo. London, 1839. Colburn.

A good title and a good deal of talent, not,

perhaps, exercised to the best advantage, nor to the extent to which its owner was capable of employing it, are the recommendations of this Tale. It is clever and unequal. Parts shew an acute observation of society and appreciation of character; but the whole is strained, and rather a caricature than a picture of the coteries attempted to be described. "The Lion," a provincial genius spoilt by favouritism and *éclat* in town, may be true to nature; but the scenes into which he is plunged are so improbable, that we feel they belong neither to the world of fashion nor reality. The personages with whom he comes into contact, such as they are, seem to be drawn from existing originals; but in his position he could not be and act with and upon them as here represented. The want, therefore, of *vraisemblance*, is the prominent defect of *The Lion*.

The first portion, with its country politics and parliamentary election, does not much interest us. The Roxburgh, Hull, Carlou, and other election committees, have placed fiction at a discount for the invention of such matters. The three sisters Warbles, however, are amusing people; and Sparker, a swaggering *parvenu*, well painted; as is Aunt Ursula, after a model of unselfish devotedness, now turning very common in our novel-writing system.

About half the work, addressed to the Lion's life in London, among blues, pretenders, literati, *roués*, and nincompoops of various denominations, will be entertaining enough even to those who do not take the trouble to guess who the frivolous Suffields, Garstons, Altons, Fullartons, Strongfells, Wicksteeds, Cottons, &c. *et cetera*, are intended to personate. They are, indeed, like Mercutio's jokes,—you may search all day ere you find them, and, when found, they are not worth the search. A Lady Merivale is the principal figure, too stately and sage to betray us into feeling much for her whereabouts; though we confess we care almost as little for her contrast with the first or second heroine—poor Agnes Gray. Among the other folks who inhabit the pages are Lord Merivale; old Brandon, a churl; one Ashmole, a sturdy puritan; one Cherry, a business-pusher; Colonel Winwood and his wife, heartless fashionables; Almond, a genuine but eccentric man of letters; and a few others of less note, who serve to fill up the measure of a three-volume novel, rather better than the average of such productions of a similar class.

Here is a sample of it. The Merivale party are driven by a storm to take shelter under a gateway:—

"They had not been here two moments, before there issued from the portly mansion to which their shelter was an appendage, the properest of middle-aged footmen, clad in a rich livery, and bursting with civility and consequence. 'His ladies,' he said, with a flourish, 'desired their best compliments, and were quite ashamed that it should hail so; but they hoped that the party would do them the honour to alight, and take shelter till the storm should be over. Miss Warble,' he added, 'would have come out herself, but for her hoarseness.' 'Miss Warble—does she live here still?' exclaimed Lord Merivale, in the blithe tone his lady had heard for many a day. 'You must have heard me talk, Isabella, of the famous luncheons she used to give me when I was a Harrow boy, shooting, down at Merivale. We shall be most happy to avail ourselves of her hospitality. Come, Isabella, here is a charming opportunity for you to practice popularity-seeking. The best soul in the world! and a little blue!' 'O, for Heaven's sake, let's see her!' said

* "The classical reader will be interested in being reminded of the singular resemblance which the details of Indian customs bear to those of the Scythians, as described by Herodotus, who notices the 'scraping the flesh from the skin of the ox with an instrument formed from his rib'; and also the method of 'scalping their enemies, and wearing the scalp-locks attached to their dress or horses' bits, he that possessed the most being esteemed the bravest warrior; every word of which description is strictly applicable to the Missouri Indians.—See 'Herod. Melpomene,' cap. 61-64."

Winwood, assisting Lady Merivale from her horse. 'Did you ever hear of any body being ashamed of a hail-storm before? It's delicious. Come, Fullarton; perhaps they will give you some luncheon. Miss Dereham, I hope you will keep your countenance!' A few steps across a court-yard, and the purdy Mercury throwing open a glass door, ushered the Merivale party into the mansion of the Warbles. Comfort was every where visible, even in its outworks—soft carpets—massive shutters—doors, through which no wind could pierce. A rich, but not coarse odour of cookery, suggested the neighbourhood of a kitchen; while works of art, numerous rather than choice, in the shape of framed embroideries, landscapes, maps, &c., hung about in the passages—proved that the owners of this paradise were liberal in mind, as well as in purse. The voices of more talkers than one broke upon the ear, as John, throwing open the mahogany door with an air, announced, 'Lord and Lady Merivale and party.' Lady Merivale dared hardly look round; there were times when she was uncomfortably alive to whimsical impressions, and the present was of the number. 'O, my lord! O, my lady! O!' . . . was the greeting of the foremost Miss Warble, as she ambled forward to receive her guests—'What a pleasure is this! What an honour!'—and a cluster of tassels, which hung from her broad-spreading turban, nodded, responsive to her welcome. 'I was saying, do you know, to our good friend, the archdeacon, only yesterday, that I really thought I might venture, for old acquaintance sake, to pay my respects to your lordship at the Abbey—but now! . . . My lady, will you allow me to present my sisters to you?'—Miss Joanna Warble—Miss Pyarea Warble—and two more turbans nodded sociable things, as the party sat down. Miss Warble, however, continued to be the principal speaker. Miss Joanna, in fact, was a trifle serious, as it is styled, and not disposed to be fluent, save in her own *colerics*: but did any poor Christian, out of its pale, depart this life—she would descant as eloquently concerning 'his account,' as if she kept the book in her own hands. She was, nevertheless, a pious, charitable woman. Miss Pyarea had yet fewer claims on society; she had little to say, save to echo her sisters; but she had accomplishments—was indefatigably notable. The queen had seen some of her cuttings in paper at a bazar, and had asked who had done them! 'Now, I am sure, I had quite a presentiment at breakfast time—had I not, Joanna?—that something was about to happen to-day! Well, my lady, and so you are really come back to make us all happy, by settling among us?—and Lord Merivale, too, going to do our town honour! It is quite delightful! I was saying so to the girls this very morning. You've enjoyed your tour, I'm sure: but then you travel every where with such advantages. Now with us poor spinsters it is up-hill work! I declare I always put Mrs. Warble upon my trunks, when I go about—and it is hard, for I'm as fond of a journey as I was when I was sixteen. Would you not take any thing after your ride? Agnes, ring the bell for Crombie.'

The visit is prolonged, and so are the exhibition and conversation of the Warbles; of whom we take this abrupt leave, to give one other specimen of *The Lion*. Lord Alton is a pseudo-author, and invites the hero to assist him in a projected publication:—

"One does not know (he tells his auditor) how their things will be stolen! I forgot what it was that I happened to give out, some-

where or other—I don't know, you see! but, Gad! before ten days were gone, Byron had got hold of it, and printed it in the 'Bride of Abydos;' and you know how that sold . . . I suppose they'll want fifteen thousand copies of this novel of mine. Shut that window, Mr. Brandon, we shall be quieter.' Nothing but an intense appetite for the whimsical sustained Robert under the offensive pressure of Lord Alton's inane pomposity. He was anxious to see what the productions of such a brain would prove. 'You see, I call my tale 'Orombello the Splendid,' said he, 'or the Sorrows of the Chieftain of the Brenta.' A title, you know, is half the battle, depend upon it; a . . . and when my book's out, Lady Gillingham will say that I've drawn myself as my own hero. I didn't, on my honour. We must get it contradicted . . . 'A romance, then, I presume,' said Robert, with very spasmodic inclinations to laugh—'of the middle ages . . . 'There's no romance about middle age—ha! ha! ha! Now, if that Mr. Suffield were here, he'd have that, and pass it off for one of his own good things. It would be a dinner in his way. No—mine is a story of the last days of Venice.' Robert bowed . . . 'And the heroine is Zingana—a gipsy, you know; a splendid being. You're not to mention this at Lady Merivale's . . . 'Assuredly not, my lord; and is the plot historical?' 'I have no plot—I thought it would be good, by way of variety, to have no plot; any body can make a beginning, middle, and end, you know . . . So I dash off at once in the middle of a wood by moonlight . . . You'll see what the style is in five minutes. Read a little; I like to hear how it sounds, of all things. Claude reads me to sleep with it every night I'm by myself. When it's published, we'll fix a reading of it at Lady Merivale's—I might have had her in my mind's eye, when I was writing. Ah! she's a delicious creature;' and then, abandoning himself to a flow of exquisite sentiment, one eye complacently taking in the booted tip of a long and flat foot, which was excruciated into shape, Lord Alton sunk back into the downy depths of his arm-chair, and prepared to listen to his own productions, and praises of the same. 'There is some poetry, my lord,' said Robert. 'O—read that particularly; my dedication, it is. There is a great deal of poetry interspersed. I've worked a play of mine into my novel, you know; and so, when the thing's dramatised, which they always are . . . you know, it will do very well for the actors, without alteration. A good idea, is it not? But don't mention it; and don't tell Lady Merivale, by the way, that I've dedicated my book to a lady. There's such jealousy among them! Now begin.' It was not without much faltering of voice, that Robert made his way through the following:—

Dedication.

To the fairest Lady of my Menage.

Queen of my bosom! Most lovely of thy sex!
Whom virtue and whom valour both respects,
With lips vermilion, and with cheek that glows
Like setting beacons upon a bank of rose;
Thy smile illumines my genius, in a tale
Of beauty, like thine own most magical,
Of love like mine, though unreturned, alas!
(So mortal hopes and pleasures fleet and pass!)
Look on my page with favourable praise unheard,
And thy opinion shall be my reward.—Alton.

'Ha! ha! I really had no idea it sounded so tolerably. One does these sort of things at a breath, you know.'

A very fair quizzing critique, some points of which, we fear, the writer might have applied to his own *Lion*, where the calf-skin is most prominent.

Malcom's Travels.

[Second and concluding notice.]

A HORDE-INVASION of new works so overwhelms us, that we are obliged to abridge our intended review of Mr. Malcom's volumes; to which, however, having offered tribute due in our last *Gazette*, we are the less uneasy at not having room to do sufficient justice.

The second part consists of digested notes on the Burman Empire since the British war; and, without going into the general statements, we select a few traits to illustrate this division.

After describing the practice of tattooing, Mr. M. says:—

'A few individuals, especially among those who have made arms a profession, insert under the skin of the arm, just below the shoulder, small pieces of gold, copper, or iron, and sometimes diamonds or pearls. One of the converts at Ava, formerly a colonel in the Burman army, had ten or twelve of these in his arm, several of which he allowed me to extract. They are thin plates of gold, with a charm written upon them, and then rolled up.'

'During my whole residence in the country (he states, in bearing testimony to the national manners) I never saw an immodest act or gesture in man or woman. The female dress certainly shocks a foreigner by revealing so much of the person; but no women could behave more decorously in regard to dress. I have seen hundreds bathe without witnessing an immodest or even careless act, though, as in the case of woman's dress, the exposure of so much of the person would, with us, be deemed immodest.'

The school of medicine is not much superior to the European Mesmerism or Morisonism:—

'There are many medical men, but few who are respectable in their profession. As a body, they are the worst of quacks. They are divided into two schools. One is called *Dat*; literally, 'element.' These give no medicine, but operate wholly by regulating the diet. They are, in general, the most respectable class, and, in many cases, succeed very well; particularly in fevers, where they allow an unlimited quantity of acidulated drink, particularly tamarind water. The other class is called *Say*; literally, 'medicine.' These go to the opposite extreme, giving enormous doses of the most heterogeneous substances. They sometimes boast that a particular pill is made up of forty, fifty, or sixty ingredients, deeming the prospect of hitting the cure to be in proportion to the number. The medicines are generally of a heating kind, even in fevers. In all the bazars are stalls of apothecaries, who display a most unimaginable assortment of roots and barks, pods and seeds. I have seen English walnut-shells exhibited prominently; indeed, whatever is astringent, is carefully saved. Mercury and arsenic have long been in use, and are, in general, given with discretion; but nearly all their remedies are drawn from the vegetable kingdom. Both classes of doctors, occasionally, add conjuring and charms to their other practices, and many medicines are vended to neutralise the effects of these dreaded mysteries. As to anatomy, they know nothing. They indeed make pretensions to this science, and have books upon it; but the sum of their knowledge is, that the human body has three hundred and sixty bones, nine hundred veins, nine hundred muscles, discharges impurities by nine apertures, &c.! Dissection is never thought of.'

They are, with all this knowledge, the proudest people in the East; "both their

religion and government contribute to this pride. Holding it as certain that they have passed through infinite transmigrations, they are sure they must have been highly meritorious in former states of existence to entitle them to be human beings, who are but little lower than Nats, and stand the highest possible chance for heaven."

As for their preparations for the journey thither, they are curious enough. "No sooner is a person dead, than the nearest female relatives set up loud lamentations, talking the while, so as to be heard far and near. The house is soon filled with the friends of the family, who suffer the relations to vent their grief, while they assume all the necessary cares and arrangements. The body is washed in warm water, and laid out upon a mat or couch, in good clothing; generally white, which is the mourning colour. A coffin is prepared, ornamented more or less, according to station, in which the corpse remains several days, when it is carried in procession to the place of the dead, and there burned, with the coffin. Sometimes the place of the viscera, and parts of the coffin and funeral car, are stuffed with gunpowder; so that, when the conflagration reaches a certain point, the deceased is blown up to the Nats!—exploded into heaven!"

If they do not observe this line of march, "when a rich man dies, the body is cleansed of the internal viscera, and the fluids squeezed as much as possible from the flesh. Honey and spices are then introduced, and the body, encased in bees'-wax, remains in the house sometimes for months. When the time for burning arrives, the town wears the appearance of a holiday. Musicians are hired, relations are feasted, and throngs of people attend in their best clothes. The body, when brought out, is placed on a sort of triumphal car, some resisting, and others propelling, with such earnestness and confusion, that the coffin seems in danger of being dropped between the house and the car. One party cries, 'We will bury our dead;' the other vociferates, 'You shall not take away my friend.' When placed in the car, the same struggle is renewed, and two or three days are spent in this manner; the people manifesting all the jollity of a festival. It is, of course, understood that the resistance must not be serious; and the party who carry out the body ultimately succeed."

After leaving Burmah, Mr. Malcom returned to Calcutta, and devotes a considerable portion of his second volume to his views of that place, and of Hindustan throughout. Malaya, Siam, and China, were subsequently visited. Mr. M. declares that the doctrines of our old friend Ramohun Roy have laid no hold of the population of India, and that his sect are all but extinct. Of Singapore, he contradicts Mr. Martin's account, and asserts that, so far from the houses being "generally of stone," with "superb granite stairs," neither the one nor the other can be found in the city (p. 97).

"The Malay peninsula (called by the natives Tanah Malayu, 'the land of the Malays') is the only great country wholly occupied by this race; and is now divided into the kingdoms of Keda, Perak, and Salengore, in the west; Johore, in the south; Pahang, Tringano, Calantan, Patini, and Ligore, in the east. There are states in the interior less known; viz. Rumbo, Johole, Jompole, Gominchi, Sungie-Ojong, Scrimenanti, Nanning Ulu, Calang, Jellye, Jellaboo, Segamet, Kemoung, &c. Some of these are divided into separate tribes; as, for instance, Jellaboo consists of the tribes of Bodoanda, Tannah-Dottar, Muncal, and Battu-

Balang. Scrimenanti embraces twelve tribes, though the population does not exceed ten thousand. Sungie-Ojong, Johole, Scrimenanti, and Rumbo, are called 'Menangkabo states.' The entire population is very small; some of the states numbering not more than two thousand souls. The whole peninsula, except Rumbo and Johore, is claimed by Siam; but many of the tribes are independent, and of others the subjection is but nominal. Scattered over the peninsula, without specific districts and locations, are several wild tribes, of whom almost nothing is known. East of Malacca are Udai, Sak-kye, and Rayet-Utan, and some negro tribes. These all go under the name of Orang-Benua, or country people. These have each a language, or dialect, but largely tinged with Malay. Further north, on the mountains, are negro tribes; but evidently distinct from the African race. Of these tribes we hope soon to know more. They seem to be a distinct variety of the human race; differing both from the African, and the Papuan of New Guinea; and inferior to both. The average height of the men is about four feet eight inches. These Malay negroes are thinly spread over a considerable district, in and in the rear of Malacca, and thence northward to Mergui; amounting in the whole to but few thousands. There are at least five tribes of them—the Joc-ons, Samangs, Oo-dees, Sak-ais, and Ry-ots. All of them are much below the Malays, and some scarcely above the apes; dwelling in trees and clefts of the mountain. A few have learned a little Malay, and occasionally venture among adjacent tribes, to purchase tobacco and utensils; but of letters they know nothing. Nor have any religious observances been discovered among them.

"In no part of the East is slavery more common than among the Malays. Not only do princes sell their vassals, often without fault, parents their children, and debtors their creditors, but a slave trade is kept up with activity, both by sea and land, and in various places. One of the chief resorts for this purpose, on the west coast of Sumatra, is Pulo Nias, the largest and most populous island of that region. The Acheens, and several other maritime tribes, both in Sumatra and elsewhere, have, for many years, been systematic and vigorous in this horrid business."

Of Siam, all we can quote is the following:—

"No place is, on the whole, so favourable for diffusing Christian books into China as Bangkok, as is evident from the statements I have made touching the trade by junks. It is important, however, to make the publications more idiomatic and intelligible before we spend heavy sums of money in this work. There should be at least eight Chinese missionaries in Siam, without reference to supplying China itself hereafter. Each of the four principal dialects,—viz. Mandareen, Canton, Taychew, and Hainan, should have two brethren, that a single death may not abolish a whole department. The adjacent villages, and even some of the ports in the Gulf of Siam, would engage their attention in part. The junks would not only supply opportunities for sending into China any number of tracts, but regular congregations, for several months together. The great difficulty in multiplying missionaries at this point is, the refusal of government to allow them to rent or purchase land for residences. It has been erroneously supposed, that from Bangkok, direct overland intercourse might be had with the frontier of China. No part of the Siam frontier approaches China within less

than about three hundred miles. The intervening space is inhabited by various tribes, living insulated from each other, and is traversed by mountains probably not passable by caravans. Zemmali is the nearest point to Bangkok from whence the western borders of China may be approached, and that station must necessarily depend upon Maulmain, in Burmah, both for epistolary intercourse with America, and supplies of clothing, printing-paper, &c."

On the subject of missionary labours altogether, we rejoice to be told

"Our visible encouragements are greater than at any former period. The number of converts within the year 1837, connected with missions from the United States, exceeds the whole number of converts during the first twenty years of the existence of missionary operations! In the same missions, religious truth is now being printed in nearly sixty languages, and at the rate of millions of pages per annum."

With this we close these interesting volumes. A few errors in printing want correction: thus, page 153, we are told that the word Lukwai, fruit, is from luk, offspring, and wai, wood; and in another place, quoted above, it is stated, by mistake, the debtors sell their creditors into slavery!

Altogether, however, both for missionary and other information, we can most cordially mention this publication; to which a number of woodcuts adds additional value.

MISCELLANEOUS.

Gazette, &c. Pp. 211. London, 1839.

Saunders and Otley.

HERE is another of those waste-paper volumes, beautifully got up, delicately bound and gilded outside, but filled with sheer nonsense—as devoid of poetry as a growing skewer is of beef. These are the volumes which the cheesemonger's boy calls for every quarter, and brings his largest bag. He knows to an inch where to look for them; and, when he delivers his "stilton," is sure to ask if we have any "pottery" to give him to wrap up in, should the housemaid by chance have removed them. Nay, even she is sure to look there, when she has to kindle her fire in a hurry. As for ourselves, we can detect them at the glance: one line is sometimes quite enough for us; one page is torture indeed: but to read the whole volume would be death. What can possess authors to publish such stuff? What can their friends be doing not to dissuade them? Why do publishers lend their names to such productions? What becomes of such books? To us these are matters of mystery, and in future (no matter from whence they come) we shall pay no attention to them. It is but a waste of time, both to ourselves and our readers.

St. Stephen's; or, Pencilings of Politicians.

By MASK. 8vo. pp. 246. London, 1839.

Cunningham.

A SORT of radical biography of some of the leading peers and commoners of the day, in which the virtue and genius is pretty well all on one side, and the wickedness and stupidity on the other. The writer speaks of Sparta and "Licurgus;" and tells us that Lord Normanby tried to govern all parties in Ireland "with impunity," which we do not understand. George IV. was "a heavy-faced hog from the sty of Epicurus;" and Burdett, Stanley, and Graham, have a separate part as "three turncoats." Mr. MASK humorously states, that his lucubrations are intended to be data for future historians. The Premier himself,

with good intentions, is but "an old man without domestic ties to keep him at home,—precisely one of those men whose society women delight in, with whom they can take liberties without danger, and form a familiar friendship without scandal!!!" The Duke of Wellington is "a man ignorant either to lead or obey public opinion;" and O'Connell, though a "magnus Apollo," never rendered one peasant in Ireland a whit the better for all his labours, which only tend to exalt the Catholic church and gentry.

The Age of Chivalry: a Prize Poem. By Alexander Macleod. 12mo. pp. 215. Glasgow, 1839. Smith and Son; London, Longman and Co.

If this was the best poem offered for the annual prize at Glasgow College (which it seems the author won), the worst must have been bad indeed. We give the opening:—

"The moonbeams fall on Caledon,
On mountain, lake, and stream—
As a bard at wooing, all alone,
The muse of youthful dream.
Nor yet alone—beside him lay,
An instrument of elder day—
A harp—'or whose responsive strings
The wind, with childlike fingerings,
Would often pass so sweet, guess,
Such bard was not companionless.
—Yet he was sad, and vacantly
He gazed upon the scene,
As if his mind were dreamingly
Thinking on what had been."

Such "childlike fingerings" are beneath criticism. Such writing is as far from true poetry as the opposite poles.

The Life of the Black Prince. By G. P. R. James, Esq. 2 vols. fcap 8vo. London, 1839. Longman and Co.

This is an extremely neat second edition, and accordingly in a form well calculated to extend the popularity of a work, the intrinsic merits and interesting subject of which would make it popular in any shape. Mr. James has done every justice to it.

The Psalter; or Psalms of David in English Verse. By a Member of the University of Oxford, &c. Pp. 393. Oxford, 1839. Parker.

We know not how it is, but we are so deeply imbued with an admiration of the simplicity and sublimity of the originals, that we feel as if even successful modern composition was injurious to them. The quaintness of the old versifiers pleases us better; and it is not from a dislike to more refined style, but perhaps from a connexion of ideas associated with infancy and education, that we cannot fancy this new edition of *The Psalter* a poetical improvement.

A New Theory of Pulmonary Consumption; its Causes, Nature, and Prevention. By Francis Eagle, Surgeon, &c. 8vo. Pp. 88. London, 1839. Benbow.

MOISTURE is the cause of consumption; saline dryness its prevention. SALT is the cure. Salt is good for almost every disease. Salt is general over the earth, because it is of general utility. Salt, if consumed to double the extent it is by every individual in Britain, would show a wonderful difference in the bills of mortality. Salt,—salt,—salt; and why not? Mr. Eagle supports his theory by some curious facts, opinions, and arguments. The same gentleman has just published an Expostulation with Professor Buckland against what he terms his "unscriptural and illogical theory on Death" (pp. 16). Mr. Eagle entertains peculiar ideas on the nature and action of light.

The Life of a Sailor, by Captain F. Chamler, R.N. (London, Bentley.)—A new and neat edition for Bentley's "Standard Library," and very appropriately illustrated by Cawes.

The Penny Cyclopædia of the Society for the Diffusion of Useful Knowledge, Vol. XIV. (London, Knight.)—This volume carries us from the lemon, *Limonia*, to the American province, of Massachusetts; and is executed in manner quite equal to the preceding volumes.

ARTS AND SCIENCES. ZOOLOGICAL SOCIETY.

VISCOUNT BRAYBROOKE in the chair.—Nearly 37,000 persons have visited the Gardens during the past month. Balance carried to Society's account, on July 1st, 1196*l*. 9*s*. 7*d*. The death of the young giraffe, in consequence of inflammation of the intestines, was announced. The apparent health and playfulness of the animal, till within a few hours of its death, gave no reason to suspect the fatal malady which was raging within. The following particulars respecting it, accidentally omitted last week, are interesting:—This young stranger at the Zoological Gardens, Regent's Park, came into the world like other ruminating animals, with its eyes open, and giving forty inspirations per minute; it bleated lowly. It is still refused the nipple; but this is considered as natural in animals of this class: the young dromedary, for instance, was not allowed by its mother to suck for six weeks after birth. After that long period, all the feelings of the mother became apparent. As a *suc-cedaneum* for the mother's milk, that of the cow, warmed, is presented to the young giraffe, who sucks it eagerly from a bottle. The mother's gestation is supposed, on pretty good grounds, to have been about fifteen lunar months: hence the compact and well-knit limbs of the young one. It is six feet ten inches in height; the girth of the trunk is two feet nine inches. Ten hours after birth it walked, though rather awkwardly; its hoofs were soft and yellow. The mother hitherto has shewn no parental affection; only once something like such a feeling was exhibited: the young thing approached her mother, she pushed it down, and then, with a look apparently of mingled pity and tenderness for a moment regarded her sprawling offspring.

LITERARY AND LEARNED. UNIVERSITY INTELLIGENCE.

OXFORD, June 27.—The following degrees were conferred:—

Doctor in Medicine.—S. B. Watson, St. John's College, one of the Physicians to the Radcliffe Infirmary.

Doctor in Civil Law, Grand Compounder.—A. Waddilove, Trinity College.

Masters of Arts.—Rev. A. Arrowsmith, Rev. E. J. Gosling, Magdalen Hall; Rev. R. Billing, Worcester College; Rev. H. G. Cooper, Rev. J. T. Johnson, St. John's College.

CAMBRIDGE, June 29.—On Tuesday and Thursday last, the Members' prizes for Latin prose compositions were awarded as follows:—

For Bachelors of Arts.—1. Edleston, 2. Bayley, Trinity College. Subject—"Quamnam commoda Britannia percipiat ex Colonis transatlanticis."

For Undergraduates.—J. M. Neale, Trinity College. Subject—"Inter Antiquorum et Recentiorum eloquentiam comparatione facta, utri palma sit deferenda." No second prize adjudged.

ROYAL SOCIETY OF LITERATURE.

DURING the pressure of many literary and scientific meetings every week, which required to be reported in our Journal, we could do little more than briefly notice some of even peculiar interest to our national literature. Now there is a pause, we have pleasure in reverting to Mr. Thomas Wright's 'Papers on the Anglo-Saxon period,' read before the above Society, and which contained so many matters of novelty and curiosity for the general reader. The papers, it will be remembered, form the Preface to the "Biographia Literaria Britannica," under the auspices of the Royal Society of

Literature; the first part or volume of which Mr. Wright has engaged to supply. It opens with the following general remarks:—

"An Essay on the State of Literature and Learning under the Anglo-Saxons.—It may truly be asserted that the literature of no other country can boast of the preservation of such a long and uninterrupted series of memorials as that of England. Even through the early ages of Saxon rule, though at times the chain is slender, yet it is not broken. We want neither the heroic song, in which the *scop*, or poet, told the venerable traditions of the fore-world to the chieftains assembled on the 'mead-bench,' nor the equally noble poems in which his successor sang the truths, as well as the legends, of Christianity. We have history and biography as they came from the pen of the Saxon writers; science, such as was then known, set down by those who professed it, and these written sometimes in the language of their fathers; whilst, at other times, they are clothed in that tongue which the missionaries had introduced, and in which the learning of Bede and Alcuin was revered, when the Saxon language was no longer understood. We have the doctrine of the Church, both as it was discussed among its profoundest teachers, and as it was presented in simpler form to the ears of the multitude. Lastly, amongst the numerous manuscripts which the hand of time has spared to us, the lighter literature of our Saxon forefathers presents itself continually under many varying forms."

After treating of Anglo-Saxon poetry, religious works, &c. &c., Mr. Wright proceeds to the interesting topic of Education; and we think the subjoined extracts on that subject, shewing how our ancestors acted above a thousand years ago, will be perused with much gratification.

"The schools of the Anglo-Saxons appear, in system and form of teaching, to have been the prototypes of our old grammar-schools. Before the time of Alfred, English was not taught in them. The elementary treatises on grammar, the first subject in their course of studies, were written in Latin; and it is probable that the teacher, or *magister*, in the first instance, explained and translated them orally, whilst the chief task of his scholars was to commit them to memory, and to repeat the teacher's comments. At the same time, they were continually exercised in reading and chanting in Latin. As the boys made themselves masters of the first elements of grammar, or the accidence, they were taught Latin dialogues, to make them acquainted with the colloquial forms of the language in which, as scholars, they were expected to converse. In the same manner, up to a very late period, the 'Colloquies' of Cordeus, and the 'Janua Linguarum' of Comenius, were the first reading books in our modern schools. The scholars were long practised in these elements of learning, before they were introduced to the higher branches. Grammar, in its more extended sense, included generally the study of the ancient authors; and since, as was before observed, it was in the study of those authors, that our forefathers, in this remote age, learned science, the name of grammar was often popularly applied to the whole course of study: so much so, that, in comparatively recent times, even the supposed power of the magician and conjuror was frequently designated by the same appellation of 'grammartye.' It is singular enough, that most of

"In the old legend of Charlemagne we are told, 'Premierement fist Karlemahe paindre dans son pa-

the ways of giving a popular form to elementary instruction, which have been put in practice in our own days, had been already tried in the latter times of the Anglo-Saxons. We thus find the origin of our modern catechisms amongst the forms of education then in use. Not only were many of the elementary treatises on grammar written in the shape of question and answer, with the object of making them easier to learn and to understand, as well as of encouraging, the practice of Latin conversation, but also the first books in the other sciences. We find this to be the case in many of the tracts written by Bede and Alcuin, as well as in those which were fabricated in their names. Afterwards, when in England the Latin tongue seems to have ceased to be to the same extent as before a conventional language among the learned, various attempts were made to simplify the steps by which it was taught. First, the elementary grammars were accompanied with an Anglo-Saxon gloss, in which, separately from the text, each word of the original was repeated with its meaning in the vernacular tongue; and then, as a still further advance in rendering it popular, the Latin grammar itself was published only in an Anglo-Saxon translation. We have seen the old Latin school-grammar pass through similar gradations in our own time. We owe to Alfric the Anglo-Saxon translation of the Latin Grammar, which, from its frequent recurrence in the manuscripts, seems to have been the standard elementary book of the day; and in the preface to that work he repeats the complaint, which had been made more than once since the days of Alfred, of the low state of Latin literature in England. Much about the same period came into use introductory reading books, with interlinear versions, which differed not in the slightest degree from those of the Hamiltonean system of the present day. A singularly interesting specimen of such books, composed also by Alfric, has been preserved in two manuscripts, and is printed in Thorpe's 'Analecta Anglo-Saxonica'; the text, which is a dialogue between persons of different professions, is so arranged as to give within the smallest possible space the greatest variety of Latin words, and so to convey the largest quantity of instruction. This curious tract is valuable to the historian for the light which it throws upon the domestic manners of the age in which it was written. Among many other things, we learn that even the school-boys in the monasteries were subjected to a severe course of religious service; and that the rod was used very liberally in the Anglo-Saxon schools. Amongst other Anglo-Saxon forms of instruction which have retained their popularity down to modern times, we must not overlook the collections of arithmetical problems which are given in all our old elementary treatises, and are still to be found in such books as 'Bonycastle's Arithmetick.' The Anglo-Saxons had a regular series of such questions, many of which are identically the same as those found in modern publications. This ancient collection is printed in the works of Bede, and again in those of Alcuin, but it is probably not the work of either of those writers. It is given anonymously in a manuscript in the British Museum, which is certainly not of a later date than the tenth or

eleventh century. The first problem in the list is this: 'The swallow once invited the snail to dinner: he lived just one league from the spot, and the snail travelled at the rate of only one inch a day: how long would it be before he dined?' The following question, in various shapes, was very popular in our old school-books: 'Three men and their three wives came together to the side of a river, where they found but one boat, which was capable of carrying over only two persons at once: all the men were jealous of each other: how must they contrive so that no one of them should be left alone in company with his companion's wife?' Again, 'An old man met a child, "Good day, my son!" says he; "may you live as long as you have lived, and as much more, and thrice as much as all this, and if God give you one year in addition to the others, you will be just a century old:"—what was the lad's age?' It may be observed that none of the problems in this collection are very complicated. The title, in some copies, tells us that they were made *ad comendos juvenes*. The other sciences, as well as arithmetic, were often the subject of questions intended at the same time to try the knowledge, and to exercise the ingenuity, of the person questioned. Among the most curious tracts of this kind, are the dialogues which go under the name of Saturn and Solomon; or, in one case, of Adrian and Rithmus. The subjects of these dialogues are sometimes scriptural notions, at others fragments of popular science, but in most cases they are of a legendary character. Thus, to the question, 'Where does the sun shine at night?' The answer is, 'That it shines in three places, first in the belly of the whale called leviathan, next it shines in hell, and afterwards it shines on the island which is called Glith, where the souls of holy men rest till doomsday.' Again, to the question, 'Where is a man's mind?' The answer is, 'In his head, and it comes out at his mouth.' 'Tell me where resteth the soul of man when his body sleapeth?' is another question:—'I tell thee it is in three places, in the brain, or in the heart, or in the blood.' Among other things we are informed that there are in the world fifty-two species of birds, thirty-four kinds of snakes, and thirty-six kinds of fishes, which shows the very limited knowledge of our forefathers in natural history. At Cambridge, there are also preserved some fragments of a metrical Anglo-Saxon dialogue between Solomon and Saturn, in which the questions discussed are much more mystical than those which we find in the present. There is also printed among the works of Alcuin, a Latin tract entitled 'Disputatio inter Pippinum et Alcuinum,' which bears in some parts a great resemblance to these dialogues. Among a multitude of other questions, we find some in this tract that are of a most fantastic character, such for example as,—'How is man placed? like a candle in the wind.—What is the forehead? the image of the mind.—What is the sky? a rolling sphere.—What is man? a painter of the earth.—What is grass? the garment of the earth.—What are herbs? the friends of the physicians, and the praise of cooks.' The following definitions of a ship remind us of the metaphorical language of Anglo-Saxon poetry:—'A ship is a wandering house, a hostile wherever you will, a traveller that leaves no footstep, a neighbour of the sand.' After going through a variety of other questions, more or less singular, the dialogue at last becomes a mere collection of enigmas, such as, 'What is that from which if you take the head, it becomes higher?' *Answer*—

'Go to your bed, and there you will find it.' The joke seems to lie in the ambiguity of the expression: as it is not the bed, but the head, which is raised higher, when removed from the bed."

FINE ARTS.

On Painting in Oil and Water Colours, for Landscapes and Portraits; including the Preparation of Colours, Vehicles, Oils, &c. Method of Painting in Wax, or Encaustic; also on the Chemical Properties and Permanency of Colours, and on the best Methods of Cleaning and Repairing Old Paintings, &c. Illustrated with plain and coloured Plates. By T. H. Fielding, Teacher of Painting in Water-colours to the Senior Classes at the Honourable East India Company's Military College, Imperial St. Pp. 159. London, 1839. Ackermann and Co.

OF theoretical disquisitions on the fine arts, by persons who never handled a pencil, a chisel, or a graver, we have had abundance. Without meaning to disparage such productions, some of which, indeed, are exceedingly valuable, it has long been our opinion that, with respect to the principles on which his practice ought to be regulated, an artist, in addition to the possession of high original powers, must "work out his own salvation" by the active cultivation of his faculties, and by the gradual accumulation of general knowledge. But as to the practice of his art, the case is somewhat different. Only the ignorant or the affected will deny the importance to an artist of technical information and dexterity. A fortunate hint may enable his hand to carry into effect the suggestions of his mind, with a facility, certainty, and perfection, which he might otherwise have passed a long life without attaining. In this point of view, the work before us is calculated to be eminently serviceable; for we presume that few professional men can read it without more or less of advantage. To the amateur it must be extensively beneficial. It is true that a considerable portion of it, especially that which relates to oil-painting, encaustic, &c., is principally derived (always, however, with due acknowledgment) from old authorities; but even here much of novelty occurs; and the part which is devoted to the illustration of the modern system of water-colour painting, is full of useful information. We subjoin Mr. Fielding's general description of that system:—

"A great variety of methods have been used since the invention of the present transparent water-colours; to enumerate them would be of little benefit to the reader, the intention of this work being to point out the most approved system of painting now in use, and which has been found so successful, that little more (if any thing) is left to be wished for. This system is the simplest than can be devised. It consists in merely mixing colours to the hue required, and laying them in their proper places; and as it is quite impossible to get the various delicate and prismatic tints of distances and skies at the first painting, we must rather attempt them by preparatory colours (not shadows), and finish by repeated and mild additions, when these are wanted, or by taking out the colours where too dark, or of a hue so far wrong as to be unconquerable by any other method. The brilliant lights in every part of the picture, where they cannot be left untouched, are to be produced by taking up the colours and then finishing them to the requisite hue, proceeding throughout to use the warmer colours of the pictures before the colder tints, as shadows, &c., are used. This is the

lais grammes, qui m'rent de de tous les arts.—'Jubnal, Rutebur', vol. ii. p. 417. In the metrical 'Image du Monde,' a work of the thirteenth century, we find one of those mystical reasons, then so common, why grammar held this high rank.—It is the column of words, and by the word God created the world!

'Par parole fut Dieu le monde,
Et tout le biens qui est habundant.'

broad outline of the practice in use by the best artists of the day, and is as widely different from that which was in use on the invention of our present water-colours as the pictures of the two periods differ in quality of every kind, in colour, richness, depth, variety, effect, &c. &c. The great point in which these two styles differ is, that the principle of the earlier mode consisted in using a mixed colour, called neutral tint, and this being made up into a cake of colour, served indiscriminately for the shadows of every kind of subject and season, whether the picture was to represent a land or sea piece, stone or brick buildings, evening or morning, sunshine or storm, summer or a wintry snow-piece. The neutral tint shadows were first laid in, and very frequently (perhaps we should say invariably) served also for distances, clouds, and foregrounds, and every kind of object; cattle, sheep, and the bronzed faces of their attendant shepherds, were most impartially shaded with the same neutral tint; after which, a variety of thin washes of colour was thrown over these leaden-coloured shadows, on which they produced so little effect, that the designation they received in the older catalogues of the Royal Exhibitions, viz. 'water-tinted drawings,' or 'a water-washed drawing,' was the best that could be given to them. We well remember these 'water-washed drawings,' and their ineffective appearance, although many of them were executed with such an exceeding accuracy of pencilling that, in fact, they became untrue to nature when applied to the distances. In general, the artists of those days trusted to their execution with the black-lead pencil, or reed pen, for the finish; both very ineffective instruments, especially the former, for producing a natural appearance in painting. The black-lead pencil is very feeble, and the reed pen much too coarse (except in very skilful hands); and both too frequently are used to represent an outline where no outline should be visible, as on the light sides of every kind of object, &c. These remarks on the neutral tint style of painting, sometimes a little varied by using Indian ink, or sepia, now fortunately obsolete, or nearly so, are merely given as beacons; for it is too palpable that every season, every kind of object, and every degree of distance, must have their peculiar shadows, as in nature they have their own proper colours, to require any arguments against this wrong system, more especially as it is hardly any longer in existence, excepting with a very small number of old practitioners; yet these in the handsomest manner acknowledge the superior effect of the modern style. This style may date its true origin with the invention of the modern water-colours, viz. in 1781, about which time Thomas Girtin was in his twelfth year, being born in 1773; and it is to this celebrated and highly gifted artist that we are indebted chiefly for pioneering the way in their proper use, and by his excellent works throwing out of estimation the 'water-washed drawings' of his time; these, however, still continued in use for some years after the world had learned, as well from the works of Girtin, Turner, and others, that the newly invented colours were capable of rivaling the hitherto unrivalled art of painting in oil. Since their first invention, they have been considerably improved; their different degrees of permanency, &c., are better known, and chemistry, now almost an entirely new science, has lavished her treasures in aiding the colour-maker's art: so that we have not much left to wish for, unless some means could be devised to render fixed a few of

the beautiful but fleeting colours, as some of our yellows, and the different tints obtained from the cochineal insect."

This is followed by a variety of details, into which it is not our province to enter, and for which we must refer our readers to the volume itself.

The Rhine: Legends, Traditions, History, from Cologne to Mainz. By Joseph Snowe. 2 vols. 8vo. London, 1839. Westley.

To those who have wandered for weeks along the banks of the Rhine, but whose lot it now is to be, like ourselves, pent up in cities, or live far away from the waters of that "exulting and abounding river," the volumes before us will afford hours of enjoyment and delightful retrospection. They will peruse the romantic legends here faithfully collected, which give an individuality to every mountain, and ruin, and crag, until, though in reality by their own firesides in England, they fancy themselves once more pilgrims of the Rhine: nay, if troubled with ardent imaginations, mail-clad knights, gnomes, or nixes; for the legends seem so natural and at home in those scenes, as to chain "Old Father Rhine" to the past; and the sojourner by his waters may be pardoned for forgetting the present (of which, doubtless, he has had enough), and fancying himself absolutely living in the age of romance. Let the happy mortal who has visited the Rhine open this book, and the noble though unfinished cathedral of Cologne (the more interesting because seeming to refuse to submit to the hand of the modern architect); the castled crag of Drachenfels, and the lovely Nonnenwörth beneath, sleeping in the midst of the stream; the still shores of the Laacher See; the overhanging rocks of the narrow Zweitzer Thal; old Lurley; and the Binger Loch, where the Nahe gladly pours his coloured waters into the Rhine;—all will again rise up before him and freshen his heart.

And to those whose occupations or means have hitherto prevented them from visiting these fairy regions, the book before us offers the best possible compensation, making them familiar with the scenes depicted. Nor need the fancy be too sorely taxed; for these volumes are interspersed with splendid plates—for the fidelity of whose representations we may honestly vouch. To all, then—to those who have—to those who have not, but yet may—or to those whose fortune it may never be to luxuriate on the banks of the Rhine, Mr. Snowe's book is a valuable offering.

We have a host of guide-books, itineraries, &c., on our shelves, but none of them were to us what this book would have been, had we fortunately possessed it. It embodies every thing on the subject—not confined to mere legendary lore, its pages present the *real* as well as the imaginary history of this German stream: with it, the traveller is amply and satisfactorily supplied. Mr. Snowe appears to have spared neither labour nor research in making his book worthy of public patronage. He is evidently not only acquainted with the German language, but imbued with the German spirit; and the mass of curious and instructive information, assiduously collected from a variety of sources, does great credit to his industry. Both the text and plates will render it an acceptable addition to a library, and no inelegant ornament to the boudoir.

SKETCHES.

NIGRITIA.

"THE Times" of Thursday last has given a

translation from a Turkish article in the "Cairo Journal," of 6th Sefter, A.H. 1255 (20th April, A.D. 1839), which contains an interesting account of an expedition of Mehemet Pasha, in person, into Upper Egypt and Nigritia. The mixture of political and scientific information is altogether curious; but as our readers do not look to us for the views of the ruler of Egypt upon Sennar, Darfour, or Abyssinia, we shall endeavour to compress into a smaller compass all that is material in the history of his highness's travels, as it relates to geography and other scientific intelligence.

Having formed the project of visiting his southern provinces in person, that he might introduce there agriculture and civilisation, the viceroy, having learned from geographical accounts that Nigritia furnished several articles of commerce, such as skins, gums, elephants' teeth, and auriferous dust, sent mineralogists to Fasangor to ascertain the existence of gold-mines, who, after having visited the country, confirmed the truth of the previous accounts. The possibility of working these mines, and of rendering them serviceable, being once established, his highness the viceroy appointed Colonel Hagreddin Bey inspector-general of the mines; charging him, above all, to facilitate the journey from Egypt to Nigritia by opening passages through the rocks which form the numerous cataracts of the Nile; an undertaking which, from its extreme difficulty, was so much the more necessary to insure travellers against dangers which too often proved fatal to their lives. With the design of adding to the stock of geographical knowledge, and of furthering science in general, his highness the viceroy ordered that accurate geographical notes should be taken, particularly of the lake called Cartoum; which on the north is washed by the White River, and on the east by the Blue River, which mix their waters, and become confounded at a short distance from the port of Cartoum. To attain this end, an expedition of 60 persons of the Egyptian navy was ordered, accompanied by three draughtsmen and an editor, whose duty should be to collect the observations made. This expedition sailed in three dahabias, which were furnished with every thing necessary for a search of long duration. The details of the ascent of the river, and the dangers in passing the cataracts, are full of interest; and the gallant conduct of the brave old viceroy (aged 71) quite a romance. Having waited two days at Dongolah, he, on the 27th, arrived at Ambiboughi. According to the information he received, it was possible in seven or eight days to proceed thence to Cartoum by way of the desert, and to avoid the circuitous passage caused by an elbow of the river at this place. His highness resolved to travel by land. In the desert some trees were found petrified by a long course of years. By exerting himself, the viceroy reached Gebel Rougam, on the 3d of Ramazan, towards daybreak. Mohammed Medin, younger brother of the Sultan of Darfour, had the honour of presenting himself to his highness. This young man can read and write, and is capable of being educated. The states of the King of Darfour border on those of the Cordofan; and his highness, in order to facilitate commercial relations, had sent to this savage monarch valuable presents by Ahmet Bey Giddani, who was accompanied by ten of his servants and ten other persons in the service of the Egyptian government. Among these presents there was a magnifying mirror, in which after the King of Darfour had contemplated himself, he sent Ahmet Bey Giddani, with

all his suit to prison, and out of the twenty-one persons eighteen perished; the Bey, with two of his servants, being the only survivors. Such an affront is highly distressing to the friends of Egypt; but his highness holding as a principle that "every thing has its time and its end," addressing himself to Mohammed Medin, said—"I will make you Sultan of Darfour in place of your brother, I will give you the *takie* embroidered with gold (a kind of regal cap in this country), and the gilt sabre." A few years ago Cartoum was a small place consisting of five or six hamlets, but the ex-governor of the Sennaar, Kouschid Pasha, who had observed the excellent air of the country, built there a palace and a mosque, planted vineyards and gardens, and attracted thither a population. Cartoum now reckons from 400 to 500 houses, with hospitals and *casernes*; and travellers find there delicious fruit for the climate, such as figs, grapes, and pomegranates.

The passage from Ambalouk to Cartoum, made by his highness in six days, could not have been performed by the dahabies on the river in less than thirty. During this interval, the court of his highness having been occupied with the chase, they killed gazelles and birds, which were presented to the viceroy, who visited Wady Medine, where there are 200 or 300 houses, a hospital, a *dépôt*, and a *caserne* capable of holding a regiment. He decreed that a fair of three months' duration should be annually held in this city. The limits of the Sennaar and Servé were passed without difficulty and with satisfaction. On the passage from Cartoum to Rosseres, a great quantity of geese, cranes, and wild fowl were met. The viceroy stayed fifteen days at Rosseres, and giraffes were hunted. His highness tasted the flesh of this animal, and it was agreed that the flavour was the same as that of veal. The mining engineer and ten officers, translators of French and Arabic, with the vessels containing all the instruments for working mines, arrived. On the 26th of Chamel, they quitted Rosseres, and after having put up at night, successively at Firuste, Gelule, and Akabad, they finally arrived at the Gebel de Fazoglou, which is twenty-one days' journey from Cartoum: On the morning of the 28th, the emerald-coloured tents of his highness were pitched, and without any loss of time the construction of a hospital, a *caserne*, and a magazine for provisions, were commenced. The inhabitants of Nigritia are Mussulmans of the sect Maliti, but the slaves are of no religion. They are divided into Beledi (inhabitants of towns), Bedavi (inhabitants of the plain), and Gebeli (inhabitants of mountains). They are generally in a state of simple nature, wild and wandering. Those who have no *meriss* or *bulbul* (the beverage *bousa*) eat the bark of trees. Nevertheless, they are fat and robust. A piece of stinking skin covers them in front. Life, that precious gift of Heaven, is passed by them in ignorance; their thoughts tend to nought but the sale of their fellow-creatures. They pay no attention whatever to agriculture, and those who have a sorry bed formed of some pieces of wood (which is called *aucari*), or can afford to drink *bousa*, are envied by their fellows, who come at night to rob them, the inhabitants of the interior committing outrages on those who dwell on the border of the Nile. [An action with the natives took place here, in which some were slain, and 541 prisoners taken, who were afterwards liberated, and their sheikhs conciliated.] At the Cordofan, in compliance with ancient usage, many negroes are enslaved, one by an-

other. His highness the viceroy issued a severe order, in pursuance of which all were set at liberty, and the choice was left them of settling on the borders of the Nile or of returning to their own country without impediment. Before the departure from Cairo, a messenger had arrived from his excellency Ahmet Pasha, informing his highness that the King of Abyssinia had sent a letter with presents, and that Ahmet Pasha had judged it right to send in return other presents worthy of Egypt, and a letter. In consequence of this intelligence, his highness had ordered at Cairo further presents more conformable to his own grandeur and munificence, with the intention of sending them to Abyssinia; but being told "the Abyssinians are savages, and it would be exposing yourself to treat with them thus,—it is even possible that they might act like the King of Darfour," he deemed it prudent to await the return of the persons sent to Abyssinia with the presents of Ahmet Pasha. He would then know from their treatment by the Abyssinian king what position he must take, and act accordingly. On the subject of commerce it may be remarked, that the culture of indigo belonged to the Miri, and that his highness ordered that it should be given up to the inhabitants of Dongolah and Berber, and put in the possession of those who were willing to pay attention to this branch of cultivation, the tools and implements of his manufactories. These engineers were sent to visit the gold mines as far as Hourideheb, opposite Fasankor, near the banks of the Nile. According to their report, they found that the gold of these places is not inferior to that of higher parts. A city is ordered to be founded, but the site is not very clearly indicated; it was, however, to be named after Mehemet Ali, and to be built in such a manner as to be unequalled by any other in Nigritia. Such were the orders left to Ahmet Pasha, and the kindness with which the viceroy expressed his satisfaction, excited the admiration of all the sheikhs in Nigritia, who promised his highness to collect 24,000 families to work in the mines; and, in compliance with the statements of the engineers, that a great part of the work would require mechanics, it was found expedient to add 1500 families to the 24,000 of Fazoglou, to form the primitive population of the new city, Mehemet Ali. It was also ordered that the reports of the engineers should henceforth be inserted in the "Cairo Journal." The mountains and valleys of Nigritia abound in all kinds of curious animals. There are birds with four wings, and others of every shade of colour. Vegetation offers the vine and wild fig-tree, from the branches of which the birds, with their varied and melodious warbling, cheer and entertain the traveller. Vegetation is surprisingly abundant and prolific; a single grain of seed generally multiplies from fifty to sixty-fold. Cultivation is carried on at Dongolah by means of small instruments, such as pickaxes, &c.; but higher up even these are unknown, the only utensil being a small-pointed stick, which serves to make holes in the earth for the reception of the seed. The doura and cotton grow with extraordinary rapidity, and the plant of the latter exceeding the height of a man, astonishes connoisseurs; for in Egypt, notwithstanding the care bestowed on the cultivation of this shrub, it is far from thriving as in Nigritia, where it is evident that the plantations will produce an excellent result. "Egypt, which is but three hundred and sixty miles long, and two hundred and forty broad, is every where renowned for the plenteousness of its harvests, but that plen-

teousness can only be obtained by labour. Nigritia, without speaking of the shores of the White and Blue Rivers, has the isle of the Sennaar, which is of itself ten times larger than Egypt. Men cannot thrive without labour." Thus spoke the viceroy to the sheikhs, and added, "If you will send your children to Egypt, I will feed them, clothe them, have them instructed in the schools I have founded, and when they are grown up, and their education is finished, my greatest satisfaction will be to return them to your arms." All the sheikhs promised to send their children, and the sheikh of the isle said, "Your highness, I have no children, but I will send you my brother's son." The foundations of the buildings, which will serve for the working of the mines, are begun. Twenty engineers have been left in Nigritia; and although by virtue of their appointment they have been supplied with every necessary by the government, his highness has granted to each of them one hundred feddans of land, on condition that they shall cultivate it, and they each shall instruct in agriculture two of the natives, to whom they are to furnish every assistance, in giving them seed and necessary implements, that they may afterwards till the soil on their own account. These engineers are to cultivate the sugar-cane, indigo, and cotton, the government exacting no duty until further orders; and even when this duty shall be exacted, it is not to exceed 10 per cent. [Returning to Cartoum, the viceroy issued many orders for the encouragement of agriculture and industry.] There are at Cartoum many Christians, of various sects, who have shewn a desire of worshipping God together in one place. His highness at once granted them a firman for the foundation of a church. Suleiman Cachef, who has been fourteen years in this country, has been appointed Bache Bou (commander-in-chief) of the White River. The Frenchman, Ibrahim, has been joined with him as lieutenant, to whom his highness has granted an income of 1000 piasters per month: and this expedition, furnished with provisions for a year, as well as with instruments necessary for observation, has been ordered to ascend to the source of the river, as far as is possible, with the aid of the rains and annual inundations. The commodities of Nigritia being current in Egypt, his highness has ordered an iron-way. The engineer, M. Lambert, declared that the iron of the country was more than sufficient for the undertaking. This engineer was commissioned to examine into the possibility of making a canal from the Nile to the Cordofan. His highness considers the region of the Nile to be a very fine country, but thinks that Nigritia will in a hundred years appear like a new America. The beauty of the country is wonderful: the air is so pure and favourable, that his highness the viceroy, who is 71 years of age, appeared to have become as young as 25. His highness quitted Cartoum on the 1st of Zilhegge. In crossing to the cataracts, the dahabie struck and shipped water. The viceroy joked and laughed at the alarm of his travelling companion, M. le Chevalier Tessiera. The barks were repaired; and on the 10th of Zilhegge they arrived at Abou Hamet. From this place it was decided to cross the desert on dromedaries; and his highness distinguished himself in this mode of travelling, invariably leaving his suite very much in the rear. On the 20th, they reached Korosa. The last cataracts were crossed in barks. Throughout Upper Egypt, his highness gave administrative orders; and, after a journey of five months and four days, arrived safely at Cairo,

to the great delight and satisfaction of every body.*

ORIGINAL POETRY.

HAWKING IN THE OLDEN TIME.

*Suggested by the Magnificent Painting of Landseer's, thus entitled.
By Charles Swain.*

THE olden time, the golden time,—
The good, old, merry time:
It is the beauteous morning prime,
I hear the opening chime!
Green mount and dale, and woody vale,
With earthly voices sound;
For lord, and knight, and lady bright,
Ride forth with hawk and hound:
In the olden time, the golden time,—
The good, old, merry time!

With hawk and hound athwart the plain
Their gallant coursers sweep,
And silver curb—embroider'd rein—
May scarce their mettle keep,
As forth they ride to river-side
Their noble game to seek:—
And soon the heron's plume of pride
Bleeds 'neath the falcon's beak:
In the olden time, the golden time,—
The old, romantic time!

When Edward, king of England, shewed
His "royale hawkynge free,"
Full thirty gallant falconers rode—
All men of high degree:
While tercel-hawk, and merlin bold,
On each gloved hand was known;
Whose silken jesses gleamed with gold,
And many a precious stone:
In the olden time, the knightly time,—
The royal hawkynge time!

When Hal the Eighth his hawk pursued,
Fast by its forest goal,
The merry monarch swiftly rued
His false, dialoyal pole!
The traitor wood looked stout and good
Till tried the leap its strength;
Then snapt,—and down roll'd king and crown
Within the ditch's length!
In the olden time, the laughing time,—
The good, old, frolic time!

When next the royal maiden came,
What pageant might compare
With nobles first in England's fame,
And England's beauty there?
The princely from his hall of state,
The student from his book,
The abbot from cathedral gate,
Their courtly joyance took:
In the olden time, the peerless time,—
The good Queen Bessy's time!

See! flash of wings from out the ford,
The wild hern speeds her way;
The towering merlin, like a sword,
Hangs o'er his watchful prey!
He darts! at one mad swoop the hern
Avoids the destin'd blow;
They chase—they fight—o'ertake—return,
Amidst the cheers below!
Of the olden time, the golden time,—
The manly, sportive time!

For mnsic, song, and banquet-room,
Who'd give his bounding steed?
The healthful breeze, the morning bloom,
His falcon's wing of speed?

The sport with grace and spirit light,
The heart-exciting call,
For all the boasted charms of night,
The masquers and the ball?
Of the olden time, the festive time,—
The gay and gorgeous time!

Hark! heard you not those ringing notes?
The winged war of birds?
Lo! far in air the white swan floats!
Was it her shriek we heard?
Ah, no! 'twas Landseer's glorious hand
His mantle o'er us cast;
And filled Imagination's land,
With visions of the past:
Of the olden time, the courtly time,—
The old, illustrious time!

And never form of ancient line
A loftier presence wore;
Ne'er leapt a bolder steed than thine
In "hawkynge trayne" of yore!
And never nobler lady graced
Her sable courser's side,
Than those Immortal Art hath traced
Upon the canvass wide:
Like the olden time, the stately time,—
The brave old English time!

I've seen the young dove in its nest,
The young rose blooming wild,
But here—upon its mother's breast,
More beauteous seems this child!
The very dogs that wait around
Grow gentle in its sphere:
If angel o'er on earth was found,
She left her sweet looks here!
Like the olden time, the golden time,—
The old Elysian time!

And when the present shall be named
But as an age gone by,
Still Landseer lives—the prized, the famed,
For *Genius* cannot die!
Whilst proud ones of a future day,
Whom thy great works engage,
Shall ask—"Who now the mind display
Which filled that gifted age?"
The poets' time, the painters' time,—
The old, Victoria time!

THE DRAMA.

Drury Lane has, we are told, been taken by a Mr. Blake, an American manager, in connexion with Mr. Bunn.

Covent Garden is about to close. We advise our readers who have not seen *Henry V.* not to omit it, for it will long be a bright recollection of the stage, and, under circumstances, they may never look upon the like again.

Haymarket.—On Monday, and during the week, an interlude, called *Foreign Airs and Native Grasses*, has been played with partial success. It appears to have been hurriedly put together, since the dialogue is positively silly; and we hear an uncle talk of marrying his niece, in order to disappoint his son: in fact, it appears to us a bad version of *The Four Sisters*. Mrs. Fitzwilliam works through a laborious part cleverly, but certainly not pleasingly. Strickland, Buckstone, Brindal, and Mrs. F. Matthews, as mere accessories, also make as much as can be of poor parts. On Thursday, *The School for Scandal* was produced, with new scenery, rich and appropriate costume, and in a style altogether deserving of very high approbation. The scene with card tables at *Lady Sneerwell's* is a splendid *tableau*. The characters generally are excellently instanced. It is too late in our week for particular criticism; but we can strongly recommend the whole as a treat in

the way of sterling comedy, such as has not been witnessed for a long time. Mr. Kean renewed his engagement for six nights, and has filled the house on every appearance.

Strand Theatre.—Cruikshank's *Lord Batsman* has been embodied here, in the most laughable style of burlesque. Oxberry is the *Chorus*, as Vandenhoff is in *Henry V.*; and the illustrative pictures are quite as ludicrous as the acting and other humorous travesties. It is impossible to see it without great merriment.

Sadlers' Wells.—They are playing *The Devil* here.

Recollections of the Scenic Effects of Covent Garden Theatre during the Season 1838-9. By G. S. London, 1839. Pattie.

THE clever and spirited sketches, with entire propriety dedicated to Mr. Macready, to whom the drama and the public are so much indebted for the originals, reflect great credit on the talent of a youthful artist. The last No. (No. 6) presents us with *Henry V.*; the preceding five having given *William Tell*, *Lear*, *The Tempest*, *Richelieu*, and the *Lady of Lyons*. Each consists of three etchings, and they are indeed very happy memoranda on which those who have seen these plays, got up in so accurate and splendid a style, may refresh their recollections; while to those who have not had the good fortune to witness them, they will convey a lively idea of what the stage owes to the enterprise and genius of the gentleman who is now about to close his arduous managerial career. We strongly recommend these little *fasciculi* to the lovers of the dramatic art and patrons of the theatre.

MUSIC.

Exeter Hall.—On Friday evening, the oratorio of "Joshua" was a fine performance; and supported by the vocal talent of Phillips, Bennett, Miss Birch, and Miss Wyndham. The audience completely filled this noble room. The choruses were very fine, though in our judgment rather too loud. Some of the recitatives and airs were beautifully sung. "Hark, to the Linnet and the Thrush!" by Miss Birch, and "Heroes when with Glory burning," were exquisitely given by Miss Wyndham. The soliloquy of Caleb, "Shall I on Mamre's fertile Plain," by Phillips, breathed of the hallowed land of the East, of the noble simplicity and power of the patriarchal days.

On Thursday, the morning concert at the Hanover Square Rooms was for the benefit of the Russian family, Matweisch, the members of which gave their usual performances. Mlle. Roeckel, Herr Rudersdorf, Signori Ivanoff, Giubilei, Messrs. Handel Gear, Croft, and Sedlatzck, and others, contributed their instrumental and vocal aid. We have enumerated the contributors in the order, and according to the degree to which our gratification amounted. Mlle. Roeckel on the piano, and Herr Rudersdorf's fantasia on the violin, were highly delightful. The concert was thinly attended.

Concert.—Mrs. Seguin's and Mrs. Hullah's concert, on Friday morning, was one of the most delightful of the season. Doras Gras and Albertazzi shone with great lustre in the vocal parts; Mrs. Hullah herself was exquisite on the pianoforte, and Mrs. Seguin sang delightfully.

VARIETIES.

A New Projectile.—Very early on Thursday morning, a new projectile was tried at Kingstou

* On the subject of African discoveries, we may take the opportunity of mentioning to those who take an interest in them, that the last "United Service Journal" contains a very able exposition of the Niger question, by Captain Allen—perhaps the best living authority on the subject.

on a pleasure-boat. It was launched from the land, lifted the boat out of the water, and shivered it literally into splinters. The explosive power was but about 2lbs., and more effective than forty times as much of powder as used at present. The effect far surpassed the promises of the projector, Capt. Warner, and was admitted at once by the parties engaging for it. The explosion shook Kingston, and was supposed to be that of a powder-mill at Hounslow.

Sleep.—"Tired Nature's sweet restorer, balmy Sleep," has, we see, by an advertisement in our columns, again sent her deputy, Mr. Gardner, the hypnologist, to town. The Queen (bless her!) need not have an uneasy head, but defy politics and all their changes: her bed may be a bed of roses, and so, in fact, may be her ministers' beds. What a discovery! to bid the world and all its troubles "good night."

Vauxhall.—A new species of amusement has been produced at these gardens by Mr. Ducrow, under the title of *Curriculum*. It consists of horse and chariot races, and displays all the powers and qualities of his stud. The entertainments take place in the afternoon.

The Sutherland Collection.—The Bodleian Library has lately received a very important addition to its treasures from Mrs. Sutherland, of Merrow. This magnificent present consists of the folio edition of "Lord Clarendon's History and Life," together with "Bishop Burnet's History of his own Times," inlaid, interleaved, and bound in sixty-one folio volumes; those volumes being illustrated with 19,223 prints and drawings of persons and places recorded in the noble and learned historian's account of the eventful periods of which they treat. This unequalled collection has long been well known. There are 335 prints of King James the First; 1340 of King Charles the First; 989 of King Charles the Second; 624 of Cromwell; 508 of King James the Second; 803 of King William the Third; 328 of Queen Mary; 311 views of London; 168 of Westminster. To enhance the value of the collection, it was accompanied by a complete catalogue, of which a few copies only were struck off, in two volumes quarto.—*Oxford Herald.*

Dividing the Hold of Ships no Novelty.—Franklin, in a letter to M. Le Roy, in 1785, writes as follows:—"While on the topic of sinking, one cannot help recollecting the well-known practice of the Chinese, to divide the hold of a ship with a number of separate chambers, by partitions tight caulked (of which you gave a model in your boat upon the Seine), so that if a leak should spring in one of them, the others are not affected by it; and though that chamber should fill to a level with the sea, it would not be sufficient to sink the vessel." [We are not sure that we have not noticed this before.—*Ed. L. G.*]

The Pressure upon the Axis of a Revolving Body.—When a body revolves round a fixed axis, the parts of it, situated at different distances from that axis, having different velocities, have different centrifugal forces; and a yet greater difference in the centrifugal forces of different parts is introduced, if they have different weights. These centrifugal forces act all directly from the axis; since all the parts of the body are describing circles round it. If the axis pass through the mass of the body, to the centrifugal force of each part, there is that of some other, on the opposite side of the axis, opposed. It is a possible case, that all these opposite centrifugal forces may exactly

balance one another; there will then be no pressure upon the axis. The general case is, however, that they will not thus balance one another, and that a certain residuum of force will have to be borne by the axis itself, constituting the pressure upon it.—*Moseley's Illustrations of Science.*

Accumulation and Destruction of the Force of Motion in a Moving Body. Distinction between Force of Motion and Force of Pressure.—Let the force of gravity be imagined to become for an instant extinct, and a ball with a string attached to it, to be placed, in the void space, at some distance above a table, in the top of which is a small hole through which the string passes. Gravity being extinct, the ball will rest, unsupported, in the position in which it has been placed. Suppose now that the string is pulled, through the hole in the table, by a series of impulses, communicated to the ball: the force of motion communicated to it by each of these impulses the ball will retain, for nothing opposes itself to its motion, and the force of motion in a body is indestructible, except by the action of some opposing force. Retaining thus the force of motion communicated to it by each impulse, the ball will at length strike the table with an aggregate force of motion, equal exactly to the sum of all the separate impulses which it has received. Moreover, this will manifestly be the case whether it receives many or few impulses before it reaches the table, whether each of them be great or small, and whether they be communicated at longer or shorter intervals of time. Thus it is true, if the impulses be infinitely near to one another, or if the string is pulled continually. Now, if the string be thus pulled continually, the number of impulses which the ball receives before it reaches the table, must be infinite; so that the sum of all these must be infinite as compared with any one of them, and therefore the force of motion with which the ball strikes the table, infinite as compared with the force with which the string is at any instant pulled. Now, let the ball rest upon the table, and let the string be pulled with precisely the same force as before, each separate impulse of the force with which the string is pulled, will now be encountered by the resistance of the table, whilst before it was the accumulation of these impulses which it had to encounter. Moreover, each separate force is infinitely small as compared with their sum. The table, then, encounters in the one case a force infinitely greater than in the other. In the one case the force exerted upon the table by the ball was one of motion, in the other, one of pressure: this example points out the characteristic difference between them, and thus it is seen that any force of motion is infinite as compared with any force of pressure, every force of motion being the accumulation of an infinite number of elements, of which accumulation, every force of pressure is in the nature of one element. It has, in fact, been shown in the immediately preceding articles, that force of motion in every case requires a finite time, and the operation of a series of impulses to its production, and is never generated instantaneously. It is in its nature an accumulation; these impulses are the elements of that accumulation, and this time is necessary to their aggregation. That force of pressure and force of motion thus stand in the relation of parts to a whole, sufficiently accounts for many remarkable analogies between the phenomena of these two descriptions of force, and therefore between the sciences of statics and dynamics. Since force of motion is

the sum of a series of impulses, it is evident that a series of such impulses in an opposite direction is required in any case to destroy it; and thus it is sufficiently explained why force of motion is never destroyed instantaneously.—*Ibid.*

Sonnet on the Anniversary of the Battle of Waterloo.

When the dread Corican, in flaunting pride,
His blood-red banner to the winds unfurled
(That cast deep twilight-gloom o'er half the world),
When Freedom to the earth her farwell sigh'd,
And back to heaven on trembling pinions fled:—
Who from his iron throne the despot hurled,
And gave once more fair Freedom to the world?
"Twas Wellington! she gave our annals back.
A hero thou indeed! To thee must yield
Phillip's proud son and Rome's imperial lord;
For noisy fame she heaped the chateauged field,
And one enslaved his country with his sword:
But thou, for suffering Freedom drew thy steel,
Struck for thy country's and for Europe's weal!

LITERARY NOVELTIES.

LIST OF NEW BOOKS.

The Works of the Rev. Sydney Smith, 3 vols. 8vo. 36s.
—The Forester, by Miss L. Boyle, 3 vols. post 8vo. 11. 11s. 6d.
—G. Robert's Dictionary of the Language and Terms of Geology, fcap. 6s.
—Poetry of the Affections, 32mo. 3s.
—The Book of Experiments, by J. S. Dalton, 16mo. 3s. 6d.
—The Helms, a Tale, 18mo. 3s. 6d.
—The Lord's Prayer Contemplated, by the Rev. F. Griffith, fcap. 3s. 6d.
—Dr. N. Wheman's Reply to Turton, on the Eucharist, 8vo. 6s.
—On National Education, by Mrs. Austin, fcap. 3s. 6d.
—Old and New Logic Contrasted, by Justus Brennan, 3s.
—Byron's Narrative of the Loss of the Wager, 32mo. 1s. 6d.
—Illustrations of Faith, by Rev. J. Cornsack, 18mo. 2s.
—The Flower Basket, by the Rev. C. Schmidt; a Story for Children, fcap. 3s.
—Lectures on the Jews, by Ministers of the Scotch Church, 18mo. 4s. 6d.
—Education of the People, by Mrs. H. Tuckfield, fcap. 3s.
—Ecloges Cicconianæ, edited by A. Allen, 18mo. 4s.
—The People's Library of Select Christian Authors, Imperial 8vo. 8s.
—The Emigrant's Friend: Canada, by E. H. Rollet, 18mo. 2s.
—R. Wallace's Pocket Guide to Book-keeping, 32mo. 2s. 6d.
—The Acoucheur, by J. Craig, 18mo. 3s.
—The London Saturday Journal, Vol. I. 8s. 6d.
—The Standard Library: Poetry, 10s. 6d.;—Manners and Ends; or, Self Training, by C. M. Sedgwick, 18mo. 3s. 6d.
—Library of Anecdotes, fcap. 4s. 6d.;—Parables, by F. A. Krummcher, D.D., fcap. 3s. 6d.;—Church, Patrons, and Pastors; or, the Establishment, by the Rev. W. G. Cole, 18mo. 4s. 6d.
—Twelve Sermons on the Faith and Practice of a Christian, by Rev. C. Gregory, 18mo. 4s.
—Literal Translation of the Apostolic Epistles and Revelation, 8vo. 12s.
—Prose Forget-Me-Not, 32mo. 1s. 6d.
—My Adventures during the Late War, by Captain O'Brien, R.N., 2 vols. 8vo. 28s.
—Temptation; or, a Wife's Perils, 3 vols. post 8vo. 11. 11s. 6d.
—Course of Nature on the Principles of Analogy, by the Rev. F. Vally, 18mo. 6s.
—The Song of the Bell, and other Poems, translated from Schiller, 8vo. 4s.
—Guide to the Antiquities of Treves, by J. H. Wittenbach, translated by D. Turner, 8vo. 8s. 6d.
—Thirty-Six Years of a Seafaring Life, by an Old Quarter-Master, 8vo. 8s. 6d.
—Selections in Pathology and Surgery, by P. Davies, 8vo. 6s.
—Protestant Manual; Sermons and Tracts, edited by J. Cochrane, Vol. I. 18mo. 2s. 6d.
—Reflections on Prayer, by Maria D. Young, 18mo. 2s.
—Pharmacopœia of the Royal College of Physicians of Edinburgh, 18mo. 5s.
—Outline of the Flora of the Channel Islands, by C. C. Bahington, 18mo. 4s.

A PRESENT for the YOUNG.

STORIES for the FIRESIDE; or, Moral Improvement Illustrated.

By MISS RIGNALL.
London: Simpkin, Marshall, and Co.

ECCLESIASTICAL BIOGRAPHY; or,

Lives of Eminent Men connected with the History of Religion in England; from the commencement of the Reformation to the Revolution. Selected and illustrated with Notes. By the Rev. CHRISTOPHER WORDSWORTH, D.D., Master of Trinity College, Cambridge, and Rector of St. Dunstons, Essex.
Third edition, with a large Introduction, some new Lives, and many additional Notes. Printed uniformly with the "Christian Institutes," by the same Editor.
J. G., and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

TRAVELS IN SOUTH-EASTERN ASIA.

In 2 handsome vols. post 8vo. with many Wood Engravings and an Original Map, price 16s.

TRAVELS IN BURMAH, MALAYA, SIAM, CHINA, and HINDUSTAN, with a full Account of the Manners and Customs, Society, Commerce, &c. &c. of the Burmese and other Inhabitants of South-Eastern Asia.

By the Rev. HOWARD MALCOM.
Charles Tilt, Fleet Street.

THE GRESHAM PRIZE MEMOIR.

THE LIFE of MARGARET BEAUFORT, Countess of Richmond and Derby, and Mother of King Henry the Seventh. Founderess of Christ's and St. John's College, Cambridge. Being the Historical Memoir for which the Honorary Premium was awarded by the Directors of the Gresham Corporation, 1836.

By CAROLINE A. HALSTED,
Author of "Investigation," &c.

Smith, Elder, and Co. 65 Cornhill.

In 1 vol. price 10s. 6d. bound in cloth, with numerous

Comic Woodcuts.

GAMMER GRETHLE; or, German Fairy Tales and Popular Stories; from the Collection of M. M. Grimm, and other Sources, with Illustrative Notes.

London: John Green, 121 Newgate Street.

LIFE of SIR WALTER SCOTT, Vol. IV.

New edition, to be completed in 10 Volumes.
Waverley Novels. 48 Vols.

Scott's Poetry. 12 Vols.
Prose Writings. 28 Vols.

All Uniform, with 100 Engravings.
Robert Cadell, Edinburgh; Whittaker and Co. London.

Price 16s. in boards.

DODSLEY'S and RIVINGTONS' ANNUAL REGISTER, for the year 1838.

Printed for J. G., F., and J. Rivington: Longman and Co.; J. M. Richardson; Jeffery and Son; J. Booth; Hamilton and Co.; Whittaker and Co.; Simpkin and Co.; G. Lawford; J. Dowling; J. Rodwell; Sherwood and Co.; Booksellers and Co.; H. Rendshaw; W. H. Reid; and Waller and Son.
Lately published, the Volume for 1837, price 16s.

MR. BENTLEY'S NEW PUBLICATIONS.

8 New Burlington Street, July 5.

Victories of the British Army.

By W. H. Maxwell, Esq.
Author of "Stories of Waterloo," &c.

8 vols. 8vo. with characteristic Illustrations and Portraits.

Hamilton King.

By M. H. Barker, Esq. ("The Old Seller"),
Author of "Tough Yarns," "Greenwich Hospital," &c.

8 vols.

Precaution.

By J. F. M. Cooper, Esq.
Author of "The Pilot," "The Spy," &c.

New edition, revised by the Author, complete in 1 vol. embellished with Engravings, price 6s.

Forming the New Volume of

The Standard Novels and Romances.

* This new edition of Mr. Cooper's earliest work of fiction, has been revised throughout by the author, expressly for the Standard Novels. The copyright of the work has been assigned to Mr. Bentley, by Mr. Cooper.

New Works just published.

The Hon. C. A. Murray's Travels in North America.

During the Years 1824, 1825, and 1826.
Dedicated, by special permission, to the Queen.

8 vols. 8vo. bound, with Plates.

History of the Reign of Ferdinand and Isabella, the Catholic, of Spain.

By William H. Prescott, Esq.
2d edition, revised, 8 vols. 8vo. with Portraits.

Captain Chamier's Life of a Sailor.

Complete for Six Shillings.
Printed and embellished uniformly with the "Standard Novels," form.

THE NEW VOLUME OF BENTLEY'S STANDARD LIBRARY.

Richard Bentley, New Burlington Street,
Publisher in Ordinary to Her Majesty.

THE ANALYST.

Price 4s. No. XXVIII. being the First of a New Series of

THE ANALYST; a Quarterly Journal of Science, Literature, Natural History, and the Fine Arts.

Edited by EDWARD MAMMATT, Esq. F.G.S. &c.

Contents.

1. Observations on the Origin and Progress of the Liberties of England.

2. Rambles in West Switzerland and the Jura.

3. Sketches in Natural History—the Hyena Family.

4. Essay on the Expediency and Means of Elevating the Office of the Postmaster in the Estimation of the Public.

5. The Monk: a Story of the Pygæ.

6. The Love Songs of the Troubadours.

7. The Musician about Town.

8. Music on the Continent.

9. The Volage and Travels of Sir John Maundeville, Kat., Illustrated with Woodcuts.

10. Critical Notices of German Works.

11. Meteorological Observations on the Nature of Fog.

12. Outlines of Periodical Literature.

London: Simpkin, Marshall, and Co.

MR. ROBERTSON'S NEW WORK.

In 3 vols. post 8vo.

SOLOMON SEESA W.

With Illustrative Enchings.
By the Senior Author of "Letters on Paraguay."

"A faithful and spirited picture of real life. The style is lively and good, and the sketches and engravings, in the manner of Pickwick, are excellent."—*Bel's Messenger*.

"It is altogether a clever production, happily illustrated by Phil. The volumes are written throughout in a humorous spirit, and it is but justice to Mr. Robertson to say that his scenes are amusing and laughable in a high degree."—*Observer*.

Sanders and Otley, Publishers, Conduit Street.

Agents—for Ireland, J. Cumming, Dublin; for Scotland, Bell and Bradfoot, Edinburgh.

THE

BRITISH ANGLER'S MANUAL; or,

the Art of Angling in England, Scotland, Wales, and Ireland. With some Account of the Principal Rivers, Lakes, and Trout Streams, and Instructions in Fly-fishing, Trotting, and Angling at the Bottom, and more particularly for the Trout. The work is highly embellished with numerous Engravings on Wood and Steel, of Landscape Scenery, Fishes, Flies, &c., from Original Pictures and Drawings by the Author.

By T. C. HOFLAND, Esq.

Price 11s. 1s. post 8vo.; or 11s. 1s. large paper. Proof Plates.

Fifty Sets only of India Proof Impressions of the Steel Plates before Letters have been printed; also Fifty Sets of India Impressions of the Wood Engravings. Price One Guinea each Set, in a Portfolio.

"Not only is the 'Angler's Manual' a perfect text-book for the fisherman, in every variety of the art, but the tourist in Great Britain can hardly have a more agreeable or elegant companion."

—*Sporting Review*, June 1.

"The result of thirty years' experience as an angler is here given to the brethren of the 'gentle craft.' As a dicer to the veteran, and an instructor of the tyro, Mr. Hofland appears to be equally competent."—*Spectator*, June 2.

"This is the most comprehensive work on angling that has yet appeared in this country. The author is an artist and an angler, and his pencil illustrates the descriptions and instructions given in his text."—*Bell's Litter*, June 2.

"It is directed for several kinds of fishing, its descriptions of scenery and the various fishing stations, with its very beautiful illustrations, render it valuable to the class for which it was especially intended."—*Argus*, June 2.

"An agreeable present to the Waltonians."—*Sunday Times*, June 2.

"Mr. Hofland's own charming pictures and drawings are transferred to wood and steel, in a manner to gratify not only every brother of the angle, but every admirer of the fine arts and of nature. It is a very complete view of the art, with much practical information, and is a capital companion for every angler."—*Literary Gazette*, June 15.

"A remarkably good practical work. It is a very valuable addition to the class to which it appertains."—*John Bull*, June 16.

Whitehead and Co. 78 Fleet Street; and R. Ackermann, 191 Regent Street.

13 Great Marlborough Street, July 5.

MR. COLBURN has just published the following NEW WORKS.

I.
Temptation; or, a Wife's Perils.
8 vols.

II.
My Adventures during the late War.
By Capt. D. H. O'Brien, R.N.

Dedicated, by permission, to Her Majesty.
8 vols. 8vo. with Illustrations, bound.

III.
The Lion; a Tale of the Coteries.
8 vols.

IV.
The Life and Times of the Right Hon. Henry Grattan.
By his Son, Henry Grattan, Esq. M.P.

8 vols. 8vo. with Portrait, &c. (Just ready.)

V.
Crammer; a Novel.
8 vols.

"Friendship, love, Christian benevolence—the balm and the blessing of life."—*Attorney*.

VI.
The Courtier of the Days of Charles II.
By Mrs. Gore. 8 vols. (Just ready.)

Henry Colburn, Publisher, 13 Great Marlborough Street.

DR. MANTELL'S WONDERS OF GEOLOGY.

In 2 vols. fcap 8vo. price 12s. in cloth, the 2d edition of

THE "WONDERS OF GEOLOGY."

By GIDEON MANTELL, Esq. LL.D. F.R.S. &c.

This edition is much enlarged and improved, and illustrated by Ten Lithographs, and nearly One Hundred additional Engravings, with coloured Plates and Sections.

A few large paper Copies are published, the size of the Bridge-water Ensay, price 30s.; to secure copies of which, immediate application should be made, as a very limited number only have been printed.

London: Selfe and Fletcher, 17 Cornhill; and A. H. Maltby, Newmarket, Connecticut.

In 1 vol. 8vo. price 7s. cloth,

PRODRUMUS; or, an Inquiry into the

First Principles of Reasoning, including an Analysis of the Human Mind.

By Sir GRAVES CHAMNEY HAUGHTON,
K.H. M.A. F.R.S. &c. &c. Member of the Institute of France, &c. &c.

"All men are as the vulgar in what they do not understand."
—*Burke*.

London: W. H. Allen and Co. Ludlow Street.

In 12mo. price 2s. in extra cloth,

THE Necessity of Zeal and Moderation in

the present Circumstances of the Church enforced and illustrated, in Five Sermons, preached before the University of Oxford.

By the Rev. W. GRESLEY, M.A.
Late Student of Christ Church.

J. G., and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

Printed by JAMES MOYSE, of Brook Green, Hammersmith, in the County of Middlesex, Printer, at his Printing Office, Number 30 Castle Street, Leicester Square, in the said County; and published by WILLIAM ARMISTEAD NICHOLSON, of Number 12 South Molton Street, in the Parish of Saint George, Hanover Square, in the County aforesaid, at the LITERARY GAZETTE OFFICE, Number 7 Wellington Street, Waterloo Bridge, Strand, in the said County, on Saturday, July 5th, 1839.

REVIEW OF NEW BOOKS.

Prodromus, or an Inquiry into the First Principles of Reasoning; including an Analysis of the Human Mind. By Sir Graves Chamney Haughton, K.H., M.A., F.R.S., &c. &c. 8vo. Pp. 263. London, 1839. Allen and Co.

"*PRODROMUS*" is the introduction to a new and, in our opinion, beautiful system of philosophy; in which Sir Graves Haughton traces the entire connexion which links Physics, Metaphysics, and Morals together, in a necessary and inseparable union; and deduces the whole from the first great Cause, the fountain of all which this world contains, all realities and abstractions, all that can be appreciated by sense, and all that can be conceived by mind. It is a work which, if men will take the trouble to think, must make a powerful sensation: for we do not hesitate to say that neither Plato, nor Aristotle, nor Newton; Pythagoras nor Confucius, have gone so deep into the mysteries of our nature, or contrived and comprehended so perfect a view of universal existence. It is, indeed, a remarkable production, and well calculated to make an epoch in the history of mankind.

In the dedication to the Earl of Munster, the author modestly observes, "I am induced to hope, that the public at large may be roused to feel the high importance of the subject, as well as the value of correct notions with regard to it in physical science; and that every man of reflection may become aware of the true nature of that upon which, as the adjunct of reason, is founded the moral excellence of the human race." This applies to the vitally important subject, *the nature of language*, without strictly ascertaining which, no philosophy can be other than a mass of confusion, contradiction, and error.

Unable as we are in a journal like this to go into an analysis of so profound a scheme, we would fain excite the attention of the public to its prodigious importance, and obtain for the author the gravest consideration. He offers, himself, the following remarks:—

"Should any one be of opinion that the truths I have brought to light have been previously discovered, he should point out where the various topics have been discussed with system, or investigated with the exactness and fulness they deserve. He should remember, that, in this instance, as in many others of human knowledge, the remark of Solomon must, from the greater age and activity of the world, gain fresh strength every day. If it were true in his time, that 'there is nothing new under the sun,' it must be much more so after the lapse of two thousand five hundred years; and during a period that has been stored, by the invention of printing, with the memorials of other men's thoughts, to an extent that would have formed at least one exception to the remark of that wise monarch. The mention of Solomon's name recalls to my mind a story relating to him, that is current among Mahomedan nations, and which, I think, will help to illustrate the design of the following observations. Pious Moslems are of opinion, that much of the glory of the Hebrew

sovereign's reign resulted from the great ability and skill of his prime minister, Asaph; whose knowledge of the occult sciences was so profound, that it enabled him to control the gins (genii), a race remarkable for their stupidity and malevolence. The fear these beings had of Asaph was such, that during his lifetime they refrained from every act of annoyance to mankind. Solomon, however, was resolved that his subjects should continue to benefit by the terror which his vizier had inspired; and, on Asaph's death, he had him embalmed, and then placed in the treasury; where he was dressed and set up, resting on his staff. The gins, who were ignorant of his death, stole from time to time to the treasury, and peeped in slyly at the window, to see what their tyrant was about; when, observing him always in a vigilant attitude, they invariably fled, lest he should punish them for their impertinent audacity. In this state of ignorance they remained for a long time; but, at last, it happened that some white ants, so well known in the East for their destructive ravages, found their way into the treasury; and, attacking Asaph's staff, he fell upon the ground: upon which the gins, finding out the trick that had been practised upon them, began to vex and harass the human race, as they had been in the habit of doing before. Now, reader, what is the whole host of metaphysicians that have formerly existed but so many Asaphs, merely preserved for the purpose of imposing upon mankind? and what are all their abstract words, but the staves upon which they rested their arguments while living, and which still continue to prop up their systems now they are dead?—and, finally, what are these few pages but so many white ants, that will, I trust, destroy their props, and let those arch-deceivers fall to the earth, never to be set up again, as bugbears to our race?"

"Having (he continues) been long engaged on a work which is intended to demonstrate the necessary connexion, relation, and dependence of Physics, Metaphysics, and Morals, I found the whole of these topics a perfect chaos, from the deceptive character of language; and I felt, accordingly, that there was no chance of giving a profitable direction to my labour, without bestowing a thorough consideration upon that indispensable instrument of thought. The following remarks were accordingly written by way of preliminary observations. As it may be some time before that work is ready, I have thought it as well to send forth this little messenger, to ascertain what degree of chance exists for its meeting with a favourable reception. It is my hope that I shall be able to lead the reader

'Through Nature, up to Nature's God;'

and bring home to him, with irresistible conviction, the inconsistencies and absurdities of *materialism*. With this view, I have laboured to clear away the rubbish that has been heaped up so high from antiquity to the present time, as scarcely to allow us more than a glimpse of truth. Berkeley has well said, that 'we first raise a dust, and then complain we cannot see;' but he neglected to analyse the nature of this

dust, or mankind would have been in possession of the means of laying it, whenever it clouded their vision. Should any unforeseen circumstance prevent the accomplishment of my entire plan, I feel I shall not have lived in vain, if the completion of this portion of it shall help to liberate the Human Understanding from some of its strongest bonds of self-delusion and absurdity."

This is accomplished in a very extraordinary manner; though we can only afford a glimpse of it. Thus:—

"*Of Things.*—I have already said, that concrete terms relate solely to what is made known to us by our senses, or by indubitable inference. But, besides these, there are many sensations which we are almost invariable in the habit of mistaking for the things which produce them. Thus, the sensation of heat is commonly mistaken for the *something* which excites it; and this is fully felt and acknowledged by chemists, and other writers on natural philosophy, who have consequently been obliged to introduce the word *caloric*, to prevent the confusion of thought that must follow from the use of the word heat in two opposite senses: but no one appears to suspect that the same kind of mistake is made with regard to light, though such is the fact. All the beautiful illumination, seeming to be caused throughout nature by the sun, is but a sensation; and if there were no eyes in the world, every thing would be dark; yet that which produced the sensation of light in us would still remain. When we say we see a light, or a flame, or a colour, we make the same mistake as the person who thinks heat and caloric to be one and the same thing. So does he, who supposes that what makes the air vibrate is the sound he hears; and he who thinks that the odour he smells is identical with that which passed from the flower he holds in his hand, or that the taste he relishes so much is in the morsel he is pressing against his palate, falls into a similar error. These subjects are merely alluded to here, that the reader may not commit the mistake of classifying under Concrete Terms, what are really Abstract: for Sights, Tastes, Smells, Sounds, and Feelings, are all Abstract Terms; and the things that produce these effects on our senses, whether they be material or immaterial, are alone represented by Concrete Terms. This is as much as I believe it is necessary to say on the subject of what is Concrete; and I shall therefore proceed to the next division of the inquiry, namely to Abstract Terms, which are all included under the word *State*.

"*Of States.*—Every Abstract word implies either a *State* or an *Action*. Thus, *goodness* is the *State* of a man who is good, that is, a *good-man's-state*; and *vibration* and *movement* are *Actions* of bodies which *vibrate* and *move*. If any one wished to generalise further, he might say that all Abstract Words imply a *State*; for we can speak of a *state of action*, and so talk of *THE STATE of vibration*, or *THE STATE of movement* of a body, still the distinction will be found to be useful in practice, as will be seen when I shew what Abstract Words are in reality: but I must first recall the reader's

attention to the way he has been in the habit of employing them. He will remember that he talks of *goodness, virtue*, and other Abstract States, as something as palpable as the class of Concrete words already alluded to; and he accordingly says, when occasion requires, *IN goodness, FROM goodness, BY goodness, &c.*, just as he would employ *IN, FROM, BY, &c.*, in speaking of a *house*, or any other tangible object; though I shall shortly prove to him, that this indispensable and necessary use of language, in the common business of life, is the root of the most glaring fallacies, when we have occasion to reason on the fundamental principles of things in general. Having thus far introduced the reader to this branch of the inquiry, I wish to inform him that it is my intention to shew, that though we can TALK of *goodness, virtue, blackness, whiteness, &c.*, we cannot THINK of them. If any one will take such a word as *goodness*, and decompose it, he will find it to contain *good* and *ness*. If he will do the same for other compound words implying a State, he will always find that he has an adjective, and an unmeaning termination.* In a similar manner, any word implying an Action, such as *movement*, may be reduced to the verb *move*, and to *ment*, a syllable of no sense. Hence it is clear that any word implying a State is derived from an adjective, or a verb neuter; and every one signifying an Action, from a verb active. Nearly every word in English ending in *tion* is derived from a Latin *verb*, and the termination *tion*,† which is void of sense. We thus see that these States and Actions have no existence, except as words; and, consequently, that there are no such things as *abstract ideas*, but only *abstract words*. Did Abstract Ideas exist in the mind before such terms were brought into use, we must equally admit that it had in it the Ideas of *saltness, sandiness, sponginess, ropiness*, and similar words, before we knew of *salt, sand, sponge, rope*, or any other thing we may in time discover, or fabricate. Should this assertion, that we only employ Abstract Words, and have no Abstract Ideas, create a doubt, let any one try to form to himself the Idea of *saltness, sandiness, sponginess, or ropiness*, without any reference to *salt, sand, sponge, or rope*; and, if he still fancy that he can, let him try to conceive the Idea or image of these qualities, without calling to mind the sounds that express them, or the things from which they have been abstracted. He will, I believe, discover this to be impossible; and, to prove that there is no fallacy at the bottom of the assertion, let him, by way of contrast, try to call to mind a *house, a horse, a dog*, or any other object that has been made known to him by one or more of his senses; and let him do this without any reference to the names they bear in his own or in any other language; and he will, I think, find that he can do it without any difficulty. His dreams, too, may be called in to the proof of this fact. In them, he sees and feels such things as he may have seen and felt in his waking moments; but his Abstract Ideas have

disappeared, though no one will deny but that it is quite possible to dream of *salt, sand, a sponge, a rope, &c.* It is no doubt very startling to have this fact brought home to us, perhaps for the first time; nor can such a rooted prejudice—that is, an opinion founded before judgment has been exerted—be at once eradicated from our minds: but it is only necessary for any one to consider it with the attention it merits, and he will not fall, however liable he must be, from habit, to continual relapses, to feel its full force.”

On these foundations Sir Graves proceeds, and after discussing a number of abstract general and particular terms, such as principle, quality, property, motion, &c.; also scientific reasoning on attraction, *vis vite*, &c., the mind, and the metaphysical categories of Plato, Gotama, Zoroaster, Jina, Locke, Kant, and others, finally concludes:—

“From the preceding observations, it is evident that Metaphysical Systems are mere creatures of the fancy, and that they are as much in contrast with one another as could be expected with reference to the nature of their origin. The low estimate in which they have been held by the common sense of the bulk of mankind has not been without justice, though it has only arisen from a sort of blind instinct. Men may be dazzled by what they hear, particularly when it is accompanied by the charms of a pleasing style and graceful imagery; but if the foundation be not laid in nature, it makes no more impression on the mind than a passing cloud in summer; for nothing can produce lasting conviction, or create a desire for closer acquaintance, but what is the very image of truth.

“Reasoning, it must be seen, is entirely dependent for its existence upon Abstractions, and differs but in its greater variety and extent from Calculation. The last process, every one feels, is merely effected by symbols; and the former, I believe, I have clearly demonstrated, is accomplished by means precisely similar. The intellect is as dependent upon such words for its efforts as the arm is upon the fingers, by which it grasps whatever it has the strength to hold up; and we are as much driven to the use of language by *instinct*, as we are to that of our teeth and jaws for biting and mastication. Above all other points, however, the reader should ponder on the wonderfully curious nature of Abstract Words; on the principle of which we cannot too deeply fix our attention, from its high importance and universality. We must see, that *we are impelled* by nature to the employment of one or more words that are equivalent, by usage, to the Term STATE: and when we search for the original of this most mysterious symbol—which is, in fact, whether expressed or understood, the foundation of all Abstract language—we find that the human intellect can give no account of that by which it is rendered the god of this nether world!”

We have only to repeat, that we deem Sir Graves Haughton's system the most complete and beautiful that has ever been offered to the consideration of mankind; and we trust that the attention of every philosophical inquirer, at home and abroad, will be directed to its earnest and mature examination.

Temptation; or, a Wife's Perils. 3 vols.

12mo. London, 1839. Colburn.

“THE object of the authoress in the following work has been a moral one. She has endeavoured (however imperfectly) to shew, first, that innocence of heart, and natural good

dispositions, are utterly insufficient of themselves as a preservation from danger; and that in order to be secure, the principles must be first solidly grounded on, and afterwards governed by, religion:—secondly, that misery and remorse, of the bitterest kind, must invariably follow any wrong exercise of the affections, even in this life:—and thirdly, that where those affections are turned towards the Divine Being, their true source, not only can no outward circumstance of misery or bereavement destroy the peace and hopefulness of the Spirit, but that greater happiness will be attained under those very trials than could be enjoyed under any circumstance of outward prosperity, where the heart is not with God.”

Had this been proposed in a religious essay, or a sermon, we should not have been astonished; but as the *test* for a novel, we confess that we read it with some degree of surprise, and with no little doubt as to the possibility of working out a tale of fiction on such a plan, which should possess the chief recommendable qualities of works of the class, *viz.* variety, amusement, incident, character, passion, and interest. The writer has, however, overcome much of the difficulty which beset her undertaking, by the skill and ability with which she has treated it. There is variety, both in the scenes and circumstances; amusement, in sketches from life; incident, natural yet unexpected; character, well drawn and original; passion, of the deepest humanity; and interest throughout the whole conduct of the tale, hardly impaired by a *dénouement* to demonstrate the important principles involved in the design, though so entirely unlike the usual termination of similar productions.

Yet, notwithstanding these merits, we cannot but think the attempt, as a moral inculcation, a very dangerous one. There may be persons in whom the noblest sentiments prevail, whilst they are pursuing the most erroneous courses; and they may thus, perhaps, be saved from actual guilt. But for one such, there are thousands who would fall prone into the abyss; and few or none, we believe, who could have their Mortons, Mrs. Wyndham, and Mrs. Claverings, to interpose between them and absolute criminality. But there is even a stronger objection to the general scope of this drama. Vernon, the virtuous adorer of another man's virtuous wife, who more than adores him in return, is not so entirely as could be wished the immaculate being from whom we could anticipate such singular and devoted disinterestedness.

“Had Helen resembled any other woman, he would not have scrupled a single moment to make love to her,—to try his chance, and occupy himself with this new interest for a time, if he did nothing more. But with her it was impossible: he would not insult her innocent purity by such a thought! Already he loved her too much, to dream of telling her so.

“Morton was a man of the world, as well as Vernon; and he was quite aware that, under Lady Montgomery's peculiar circumstances, most of that set, termed men of fashion, would think nothing of endeavouring to turn her from the path of duty, for the mere amusement and gratification of the hour, and afterwards scruple not to boast of their triumph to the world, and, perhaps, abandon her the moment she wearied them, or any newer object excited their sickle fancy. Such a man he believed Vernon to be; but he did him injustice. Vernon, it is true, had lived in the world, and, to a certain degree, conformed to its principles. For instance,

* “The apparent significancy of such terminations as *ness, ship, hood, head, &c.*, will, if they are referred back to their original forms, be found to be quite delusive; for instance, *ship* does not mean a vessel, nor *head* the upper part of the body; and so of the rest.”

† “Some will perhaps prefer restricting the termination to *io*, instead of *tion*; as the abstract nouns formed with this affix always incline in their formation to that of the past participle, and not to the present tense. For example, *secretio, actio, &c.*, are more connected with *secretus, actus, &c.*, than with *secretum, ago, &c.* The reader can choose which form he likes best: my object, on the present occasion, is not with etymology, but simply the elucidation of a general principle of language, for which I endeavour to find the readiest means.”

nobody had flirted more with married women, and nobody had had more reputation for *success* than he; but then it had always been with those whose characters were suspected, whose purity was far from undoubted. He had never seduced one virtuous heart from the principles of duty; his conscience could not accuse him of anyone's ruin, though he might have taken advantage of the ruin which others had occasioned. He was, besides, by no means devoid of feeling—that kind of feeling which the world does not patronise. He was never known to boast of his success with any woman; he considered it dishonourable to take advantage of her weakness, merely for the sake of gratifying his own vanity. In fact, Vernon was essentially different from the set he lived in, though, in his outward conduct, he might conform to its habits and mode of life."

This may be fashionable Virtue, and by comparison it is so; but it is in reality Vice, and Vice without disguise. Our authoress seems to think that not boasting of "success" with females is a man's passport to great commendation. Except fools, idiots, and liars, we should suppose few men were ever guilty of such an atrocity; and that even the mere man of pleasure was, for his own sake, too clear-sighted to indulge in so empty a triumph. But the following is still worse: after Vernon and Lady Montgomery having mutually confessed their burning love:—

"And did you really never love till you knew me, Vernon?" said Helen one day, when he had been relating to her one of the many *Nelsons*, which had formerly occupied his attention, without ever interesting his heart. "Never, dearest!" was the earnest and enthusiastic reply. "And this, perhaps, may be the reason why I love you so intensely, so engrossingly! You are, you have been, all in all to me. None has ever divided with me the affection you possess! None ever can do so! I cannot look back, and remember the time when another was dear to me as you are! when I lived on another's smile, and was blessed in the light of another's presence! Until I saw you, my heart had been cold and untouched!"

And so would a common lover talk to every new flame; but none, except an ass, would entertain her with the history of his preceding "many *Nelsons*."

Were this novel of an ordinary order, we would not apply to it the severity of critical remark, which is more just towards productions of a graver class: but poison is most fatal when administered in the form of medicine; and the superior talent displayed in *Temptation* renders it the more incumbent upon us to warn the reader against that which may be misleading and hurtful to an excellent purpose. But as we are not going to lecture upon the subject, we shall now proceed to copy a few extracts as specimens of the author's talents, which are indeed displayed to great advantage in delineations of the strongest emotions of the heart, in traits of character, in pictures of various grades of society, particularly where children are concerned, and in general observations upon life and manners. When Helen, the charming girl of seventeen, has married the doltish, apathetic, and good-natured Earl of Montgomery, it is told:—

"My lord is quite ready, my lady, he bid me say, whenever your ladyship is," Helen started from her reverie. "My lady!—your ladyship!" The words sounded strangely, but not unpleasantly in her ears. And was it really so?—Yes, she was married!—and a

countess! In the morning she had been simply Helen Gardner; an humble, insignificant individual,—and in a few short hours she had been metamorphosed into a married woman, and a peeress of the realm. She looked at herself, to see if there was no change in her appearance since she rose. She almost doubted her own identity. But, no!—there she was—the same Helen as before—it was but the change of a name!—and, "What's in a name?" says Shakspeare:—a great deal, sometimes:—at least Helen thought so."

This same lord, who is cleverly and originally painted, had one constant practice of always telling people what o'clock it was; as if he had been by nature predestined for a cuckoo. But we pass that, and his gross blindness, whilst his wife's early attachment to another is brought about, to give an instance of the author's skill in observing life. Lady Montgomery's infant daughter has been rescued from the jaws of death, and the doctor informs her anxious parent that nothing would be more likely to restore her than asses' milk:—

"Of course, Helen was all anxiety to get a donkey immediately. 'You must see about it, Cox,' said she to the butler. 'I wish you would inquire every where in the neighbourhood yourself. Of course, there is such a thing to be had?' 'Indeed, I can't say, my lady; but I should think so,' replied Cox, not a little pompously; and he retired, somewhat indignant that a person of his importance should be deputed to make inquiries about asses! 'My lady is not, by no means, what I call considerate,' said he to Mrs. Wilson, the housekeeper. 'Only think of her setting of me to find a jenny for Lady Susan! I've lived in many situations, but I must say I never was desired to do such a thing as that before; and I consider it *thly* supererogatory!' 'Dear me!' said Mrs. Wilson (who, happening to know that Cox had saved a very pretty penny in his different 'situations,' and was rather thinking of settling in a small way of business, whenever he should leave Lord Montgomery's family, took care to flatter and court him as much as she could), 'dear me! Mr. Cox, don't you know my lady's a silly young thing, that don't know nothing of what's due to a person like you? And it ain't her fault, neither; for she's never been taught to reprimand, as a lady should. I'm sure, my lord, poor old fool! he ain't capable for to learn her them nicer sort of things! But you'd better send the groom; he'll soon find her a jenny, without your putting yourself out of the way. The groom happened to be in a very surly humour (for even grooms think they have a right to sulk, like their superiors), and he received Mr. Cox's order with no great satisfaction. His business, he considered, was to ride with my lady, and not to find her asses. Besides, the horses required rest,—they had been worked so much more than usual lately, what with one thing and another. However, if he must go, he must; but he would take it very leisurely, and not put himself the least out of the way. Accordingly, he sauntered along at his ease, inquiring every now and then at places on his way; and hearing of no milch donkey to be had, after a time, turned his horse's head again towards Norburn, and returned home; having been absent long enough to scour the country in every direction. And half an hour after his return, Mr. Cox proceeded upstairs to Lady Montgomery, and, with a very grave countenance, informed her that he had made every possible inquiry in the neighbourhood, but that there was not such a thing as a milch donkey

to be had for love or money. 'Dear me!' said Helen, with a very mortified face; 'are you quite sure? It seems extraordinary one should not be able to get one! Did you inquire particularly yourself, Cox?' 'Yes, my lady; I've been to a number of places, and I made every possible search, but I couldn't hear of such a thing not nowhere, far or near. However, I'll go on inquiring, of course, my lady; and I dare say, in a few days, we shall hear of one to be had.' A few days was a long time to wait; but there was no help for it, so she must submit; and she went upstairs to the nursery, quite melancholy to think that little Susan could not yet begin to be made strong."

The female society of Cheltenham is also cleverly and piquantly sketched; and Aunt Letty, Lady Douglas, Lady Scone, &c. &c., are all truly figured. Mr. and Mrs. Smithson and family are also good of their kind:—

"When dinner-time arrived, so did the clergyman and his wife; the former, a worthy inoffensive man, who was never so happy as when he was surrounded by his group of ruddy-faced boys and girls,—whose number his wife generally made a point of increasing regularly every year, to the very great astonishment of the older ones, whose curiosity to know where babies came from, grew more and more intense, every time a fresh baby appeared! 'Pa! do tell us how little Jacky and Susan came?' was a request so often repeated, that, at last, it became a positive nuisance. 'I know they didn't drop from the clouds, as nursery said, because, how could they have come through the ceiling, you know? and, besides, how could ma tell when to expect them?' And 'pa' was obliged to have recourse to the old method of sending the young fry out to look for babies under the gooseberry bushes, and catch sparrows by putting salt upon their tails, in the hope that bodily exercise might check in some measure this ardent thirst for knowledge (which, however beautiful in theory, is sometimes inconvenient in reality), and that they might come home too tired to plague him any more. As for Mrs. Smithson, she was in no way remarkable, excepting, as we have before said, for her prolific qualities, which seemed as though they could never be exhausted, and which continued to manifest themselves with unabated vigour, till even her good-natured husband, fond as he was of children, and proud as he felt of his own, was tempted to cry out, 'Hold, enough!' It was a great comfort, indeed, to see such a fine family; and a 'fine family' they were universally allowed to be, probably because there was a greater proportion of flesh and weight amongst them than is usual, and a set of lungs capable of producing a more considerable volume of sound! For it seems it is not beauty that creates what is called 'a fine family,' but merely the right number of legs and arms, and great fat rosy cheeks; and, not unfrequently, 'a fine family' will grow up into a set of very ordinary-looking men and women. Still, 'a fine family' is considered a most desirable thing, and Mr. Smithson thought so; but it seems his servants did not; for it was found almost impossible to get any maid, however hard-working and obliging, to bear long with the noise, the kicking, and cuffing of this 'fine family.' 'Very sorry, master, to leave you,' was a speech the parson had had more than once to listen to; 'but, really, the young ladies and gentlemen is so rude and *mischievous*, that I can't put up with it no longer.' Mrs. Gardner had a perfect horror of this 'fine family,' and she always made a point, when she called upon Mrs. Smithson, which she did

very rarely, to choose the time when she knew them to be all out,—it would be too much to face such a tribe of little savages! Of course, this happy pair were all anxiety, as soon as they arrived, to see Lady Montgomery's children,—which request brought forth many compliments from all sides upon their own 'fine family,'—and they were both in the height of good-humour, when little Susan and the baby made their appearance; then, the noise and confusion became perfectly indescribable. Mrs. Smithson caught Susan by the hand, and dragged her upon her knee, whilst her husband seized the baby from the arms of his nurse, and began crowing to it in every variety of tone;—patting its cheeks, and roaring out in a stentorian voice, 'Gumpity, gumpity, gumps!—gumpity, gumpity, gumps!' 'One can see that you are accustomed to children, Mr. Smithson!' said Lady Montgomery, smiling good-naturedly, but, at the same time, feeling quite unhappy for poor Lady Douglas's nerves, and longing that she could give him a hint. 'Oh, yes! to be sure, my lady! got so many of my own, you know—plenty of olive-branches, ha! ha! Gumpity, gumpity, gumps!' 'Dinner is ready, ma'am; said a servant, entering,—but the parson was deaf to every sound but that of his own voice. 'Gumpity, gumpity, gumps!' roared he. 'Come, Lady Susan, my dear!' said Sanders, 'it is time for you to go to bed.' Upon this, Susan, who was listening to a very amusing story about something very naughty that some little boys and girls had once done, set up a squeal! Sanders remonstrated with her; and this joined to Mr. Smithson's crowing, and 'gumpity, gumpity, gumps!' produced a chorus of sounds, such as had not often disturbed those quiet walls before. At length, however, Mrs. Smithson contrived to make her spouse understand that he must leave off vociferating. The party, with their one man, proceeded to the dining-room, and peace was again restored."

We are now called upon to conclude; and we do so with some reflections, which, though of an ordinary nature, are well expressed, and can hardly be too often repeated, too deeply impressed:—

"There is something in our nature which renders us singularly incredulous in grief. We know that death has found out our dwelling; we know that we have really lost one we loved; yet we ask ourselves, again and again, Whether it can be really so, whether it can be possible that we shall see him no more; that he will no more appear in his accustomed place—never more speak to us gentle and endearing words as of yore—never more be conscious of our care or our affection? Our reason, indeed, assures us it is so; but our hearts refuse to believe it. I remember a few touching words, uttered by a mother who had suddenly lost her daughter in the prime of her life and beauty, by an insidious disease;—'At first I could not believe,' she said, 'that I should never behold her again; never see her enter the room as she used to do; never hear her voice any more! I knew it, but I could not believe it.' To me, there was something very affecting in this simple sentence. I could so well sympathise with the feeling—it conveys volumes of quiet, enduring sorrow, to my mind! for, oh! how much must be borne before the heart becomes reconciled to that sad word—Never! Sometimes I have thought that no means would be so certain of controlling our tempers, and restraining any impatience or irritability, to which we may be prone towards our more intimate connexions, than the idea

continually recurring to our minds of what we should feel, if they were suddenly taken away from us by death. Could we be told that one among us would be summoned away a few hours hence, how should we vie with one another in shewing that one every kindness, in bestowing upon him every proof of the tenderest love during the short time we were still blessed with his presence! How should we regret every instant of pain we had caused him, and implore his forgiveness for every fault of which we had ever been guilty towards him! Yet how often do we act with harshness and unkindness towards one whom it would well-nigh break our hearts to part with; forgetting that, perhaps, the morning sun may rise, and he may be no more! never again able to receive kindness at our hands, nor to listen to the assurance of our love. Ah! why is death so constantly forgotten? why do not we live always as though we were about to die?"

We think it evident that the writer, if she does not belong to, has had opportunities of observing much of, the upper classes of society.

My Adventures during the late War; comprising a Narrative of Shipwreck, Captivity, Escapes from French Prisons, &c., from 1804 to 1827. By Donat Henchy O'Brien, Esq., Capt. R.N. 2 vols. 8vo. London, 1839. Colburn.

If ever there was a truly personal biography, this is it. The gallant captain's portrait is in front, his rare adventures in every page, and pictures of the most striking incidents to illustrate the whole. Lamenting, in common with our race, that no man can be a hero in the eyes of his *Walley-de-Sham*; it is some consolation to us to think that every man is more or less, in some degree or other, with some cherished fancy about his own endowments or actions, a hero in his own contemplation. Few, perhaps, have had so many reasons to indulge in this pleasing notion as Captain O'Brien; and therefore it is that we receive these two thick volumes from his pen, descriptive of his various fortunes, in good part; though there is enough of the same sort of hair-breadth 'escapes, of being sold to the insolent foe, of his redemption from captivity, and of his exploits, battles, and other exploits.

Behold him, then, a midday, blown into Brest in a storm, his boat taken, and himself and shipmates marched off prisoners to Verdun. During twenty-nine days, and covering seven hundred miles of road, they endured many hardships; and found but sorry lodgings at the end of their travel. From this moment our author was incessantly occupied in attempts to escape; for he was one of those whom nothing but their own Parole of Honour seemed capable of retaining in confinement. In 1807, he traversed France to Boulogne, hiding in woods, and enduring every species of distress; when he was discovered on the very shore of the sea, and in sight of the white cliffs of Albion, and carried back, more cruelly than before, to the dismal and fatal fortress of Bitch.

At one place he tells us, and it may serve as a general specimen:—

"Our route was through Hesdin, and St. Pol, to Arras, where we saw several of our countrymen, who were not so extremely cautious as Mr. Kemp, although we were conducted through the main street, loaded with chains. The gaoler here behaved with kindness and civility to us, and (with the exception

of one) was the most humane man in that situation I ever knew."

The horrors of imprisonment at Bitch were insufferable; and, in spite of every precaution, Mr. O'Brien again escaped, and in eight days reached and crossed the Rhine by the bridge of Kehl. The anxieties and escapes of the parties who undertook these perilous flights are beyond fiction. Our poor countryman was retaken in Bavaria; and we learn:—

"It was on a dreary Sunday night, the 29th of November (1807), that I was led into this gaol. The gaoler and his keepers placed me in a tolerably decent, well-furnished apartment, with a bed, stove, table, and chair. This was ample for the accommodation of unsophisticated man, but external conveniences are not a substitute for the cravings of hunger; and even if not, to contradict the words of the poet, a man could cloy the hungry edge of appetite with bare imaginations of a feast, it had been such a length of time since I had fed on any thing save roots and raw vegetables, or had tasted, at best, any thing but the scanty and meagre fare of road-side inns, or of gaol allowances, that it was far beyond my imagination to form an idea of what a feast meant. I therefore pointed out to my keepers the exhausted state of my body, and begged that I might have some refreshment, however humble or however small. This they granted; but they previously searched me—stripped me—took away the whole of my clothes, with all that my pockets contained—which consisted, however, of nothing but a knife, a razor, and a few pieces of silver. They assured me that all my property should be returned to me at a proper time; but I entreated them to leave me at least my pantaloons. With this they at length complied. With respect to my shirt, as the collar and ragged sleeves were all that remained, I was indifferent to the comfort of preserving it. I expostulated with my persecutors, and begged to know the reason of such cruel treatment. They surlily replied, that it was the custom of their country, and that they would take care to prevent my getting away again. 'People who had a great talent for getting out of gaols ought to be treated accordingly,' they said, and they added that they would prevent my escaping from their clutches. Saying this, the morose brutes swung to the massy door, and my ears were greeted with the noise of locks, bars, bolts, and my eyes with the prospect of chains, that seemed heavy enough to secure the bodies of a regiment or an army. In this state of nudity and solitude I began, with inexpressible grief and bitter affliction, to meditate upon my unfortunate destiny. At length, a thought flashed upon my mind. Although my cell in its masonry seemed as strong as the bomb-proof casement of a fortress, and my ears had informed

* "And in dire necessity of his humanity, were we all at this moment; but more especially myself, for so completely knocked up was I from excessive fatigue and exhaustion, by the length of this day's journey in chains, that I found my head quite dizzy, and had actually swooned and fallen against the prison walls before the gaoler could conduct me to my cell. Some gentle young men of the town, to whom Tuthill and Essel had contrived, in passing to the gaol, by signs, to make known that they were freemasons, obtained permission for both to accompany them, for the night, to their houses, where they were most hospitably entertained; whilst Ashworth and I were left upon straw and scanty prison fare in the dungeon. This circumstance determined us to be made masons whenever an opportunity offered; and which subsequently took place, with respect to myself, at the Freemasons' Tavern, Great Queen Street, Lincoln's Inn Fields; for I consider it a solemn, moral, and useful institution, and that it is impossible for a conscientious freemason to be otherwise than a worthy member of society."—[This is a strong recommendation of Freemasonry and its golden rules.—Ed. L. G.]

me of the massive strength of the door, and its ponderous securities or fastenings, yet it struck me that there might be some point of weakness, of which I might avail myself to effect my escape. It is astonishing how Providence, in its mercy, at the hour of the most bitter afflictions, supplies us with hope to alleviate our sufferings. It does not signify that the hope is delusive, for it answers the object; and the pleasure of indulging in it is longer and greater than the subsequent pain of disappointment. In this disposition to hope, every thing tends to gratify or favour the inclination; and I even inferred, from their taking away my clothes, in order to prevent my escape, that they were conscious that the gaol was weak in some point or other. In this pleasant delusion I waited with anxiety till daylight, that I might make all the observations in my power; and I felt determined to be off on the following night, even if I should be stark naked afterwards. Except when these hopes and frail calculations passed my mind, I was a prey to the most cruel torments. I never slept—I merely slumbered; and in those brief slumbers I was dreadfully agitated. At one time I was seized with the idea, that all my late companions were safe, and that I was the only unfortunate wretch of the party that was doomed to suffer. In another paroxysm I was tormented with the thoughts of the ease with which I could have avoided the fatal gateway, had I been aware that I was on the road that passed it. With what bitterness did I reproach myself for want of circumspection: in short, I found myself in a state of distraction. I endeavoured to tranquillise my mind with the hope of being able to get out of my present prison, or, at all events, of escaping from my guards on our march back into France; I had already got away from the most strict guards in the universe, the French *gens d'armes*. These ideas proved to be a kind of salutary balsam to my tortured bosom. It is hardly possible for persons who have never experienced any thing like the distress I had undergone, to form any idea of the dreadful manner in which the mind is agitated on such occasions. I found myself excessively cold during the night. A severe frost and snow had set in; and at this season of the year I could not expect it to be otherwise. In the morning, at an early hour, an old lady (the gaoler's wife) presented me with a cup of coffee, which I eagerly swallowed: the poor woman felt very much for my distressed situation, and actually shed tears. I begged she would provide me with materials for writing a letter to the commandant; her husband brought me them, and I remonstrated with the Cerberus on his cruelty in having me stripped of my clothes in a gaol (which, to my grief, I now discovered to be too secure), when he could have no idea of my being able to get away from it. I begged, at least, to have a neck handkerchief and cap returned to me, and desired he would order the money I had been deprived of to be laid out in purchasing a coarse shirt and pair of stockings, which I very much wanted. I also requested I might be allowed one of the military surgeons to dress my feet, that were still in a very bad state: all these demands he had the kindness to grant. The secretary came and informed me, that I should be detained until they received orders from the government at Ulm, which would be in about twelve days; he expressed great sorrow for my misfortunes, and retired. Great consolation was this to a poor devil without clothes! At length the surgeon came, and humanely dressed my sores; and he expressed his astonishment at how I could have travelled with my feet in so sad a

condition. When I looked at their lacerated state, my astonishment was not less than his; nor was that astonishment lessened by the extreme pain they now gave me. The mind at ease can scarcely form a conception of what the body can undergo when influenced by the stimulus of danger; and although I freely confess, that at this moment I enjoyed any thing rather than mental tranquillity, I was still amazed at how I could have walked such an immense distance with feet so swollen and so cut to pieces. After the surgeon had quitted me, I went to bed, and I felt a little more calm in spirit; but vain were all my efforts to close my eyes. Pain would keep me awake, and busy thought, cheerless of the past, and hopeless of the future, would crowd into my restless mind. In this state I lay till noon, when the old lady, the gaoler's wife, brought me my dinner. It was a tolerably good meal, considering the quarters I was in. She informed me that I was allowed nothing but water to drink. This I considered very inhuman, as my miserable state required something more stimulating. I thought it unkind that the surgeon did not order me a small portion of wine as a medicine."

Such is the tenor of this narrative of escapes, the third of which was crowned with success, for the party penetrated into the Austrian dominions (where they were safe), and thence got to Trieste.

Here, however, a misfortune of another kind attended Mr. O'Brien; he was wounded in a boat-action as he was leaving the port for the Amphion frigate, and very nearly made prisoner again. He was now appointed lieutenant in the Warrior, and thence moved to the Amphion. He fought in all the splendid Mediterranean and Adriatic services of Captain Hoste, and then proceeded in the Slaney to South America and the Pacific. Here, to vary our theme, we shall copy out three fishing extracts.

"On quitting the beach, I was struck with amazement at the extraordinary manner of fishing in this country; and yet the supply of fish is so superabundant, that tons and cart-loads of it are to be found lying in a state of putridity on the fields and road-sides. To see fishermen standing upright on the backs of horses, half of their bodies, and all the horses, excepting the heads, being under water, struck me with astonishment. The mode of fishing is, however, simple in principle, though the practice is difficult of attainment. A seine, or long net, is extended along the sands or flat part of the beach, fairly laid out and spread, and to each end of which the fishermen, in a proper manner, attach or harness a horse, then mount and ride into the river, keeping the net fully distended, until they perceive by the exertions made by the horses in swimming, that the net is becoming ponderous; when they cross each other, close the apertures of the net, so as to preclude the possibility of losing the fish, and return to shore, where a large party is waiting their arrival, ready to empty the seine and bear its contents away.

"Whilst we were in this harbour, we were frequently visited by whales; and they seemed so ignorant of the inhuman propensities of man for destruction, or so prone to consider us as a better species of our biped species, that they would pass close to our ship. Notwithstanding this generous confidence in our humanity, we used to consider them as fair targets for practice, and occasionally fired a nine-pounder at them; but whether we were bad marksmen (which, by the by, on other occasions our men proved themselves not to be), or that the whales were nine-pounder proof, the fact is, that we

were guiltless of the crime of whale-slaughter. The natives against the mussels were by far more potent than our nine-pounders against the whales. I could scarcely credit their method of catching their shell-fish, if I had not myself witnessed it. A man and a woman in a canoe push off from the shore to a certain depth, when the man, with a long pole, ascertains the depth of the mussel-bed. He then sticks the pole, which is sharpened at the end, into the bed, and makes it serve as the anchor or mooring for the boat: the woman, who is almost in a state of nudity, and ready with her arms around it, makes it her line of descent. With this as a conductor, she slides, or slips down, and soon reappears, with her arms crossed round the pole, but with both hands as full as they can hold of mussels. Having deposited her handfuls in the canoe, she descends again and again for six or eight times, until her cargo is complete. The time of their keeping under water appeared to me extraordinary. I know that, amongst scientific persons, a difference of opinion exists as to the time which the human body can suspend respiration under water; but I have accurately marked these people by my watch, and found that they could remain immersed for three minutes. On one occasion, I recollect expressing to a man my great surprise, not unmixed with regret, or almost indignation, that he should impose upon the women this difficult, or even dangerous duty, instead of undergoing it himself. The fellow seemed greatly surprised at my ignorance of the merits of the case. He explained to me, that this diving was a privilege of the sex, and that no man would be, or dared to be, so unmanly as to rob a woman of her birthright.

"On our passage back to Valparaiso, we caught a shark, only ten feet long, but of immense bulk. On opening her we found eight young ones of the size of salmon poul, alive and perfect in form, with ten others equally lively, but of the size of mackerel, and, as far as we could judge, of a distinct breed. A physiologist, or a comparative anatomist, would have travelled far to witness such a dissection, or *post mortem* examination; but all my crew thought of was eating the fishes, and they seemed to relish their capture very much, albeit it was not of the most tender or delicate description: and, with respect to the parent of the numerous progeny of voracious fishes, they confined their ravenousness solely to the tail. The notion that carnivorous and voracious animals bring forth only one at a time, or one *per vitam*, was here disproved; for this shark was as prolific as any sow or rabbit that could be produced as an extraordinary instance of fecundity."

A Continental Trip.—On his return, a post-captain, Captain O'Brien, with his lady and child, took a continental trip, and revisited the scenes of his early sufferings. From this we shall merely copy a passage, and conclude:—

"When I had last travelled on the road over which I was now passing, I was an unfriended, poverty-stricken, broken-hearted fugitive, amidst implacable and vindictive enemies, dreading even the sound of the human voice, or to hear my own, lest I should be again captured and led back once more to chains and dungeons. Then I had been upwards of eleven years in the naval service of my native country, five nearly of which had been spent in cruel captivity; I was but an humble midshipman, and the precious, inestimable, and irrevocable time for gaining honour and reward in my profession was wasting in almost hopeless anguish. My lurkings in woods and caves by day; my wanderings by night, with all my sufferings

from pain, fatigue, hunger, and inclemencies of the weather, passed in review before me. How great was now the contrast, and how excessive my gratitude to Divine Providence for the unbounded mercy I had experienced! My services had advanced me to the rank of post-captain in the royal navy, which I idolised. Fortune had bestowed on me all pecuniary means of happiness, to a mind disposed to be satisfied, and I was surrounded by every comfort, and with the means of fulfilling every wish which a rational mind ought to form; and, greater than even all these, I was accompanied by a most affectionate wife, and was the protector of my boy, the first and beloved pledge of our happy union. Life was sweetened by numerous friendships, in which I was conscious that I possessed the attachment and the esteem of men of honour and merit whom I valued. These were now my feelings in travelling my old beaten track, and I must leave the sketch to be filled up by the feeling minds of my readers."

Memoirs of the Life and Times of the Right Hon. Henry Grattan. By his Son, H. Grattan, Esq. M. P. 2 vols. 8vo. London, 1839. Colburn.

If there be one subject more repugnant than another to us to look at or discuss, it is the subject of Irish politics. There are such direct oppositions of opinion, contradiction of facts, clashing of data, asperity and bitterness of party, bad temper, religious dissension, and vindictive feelings, that we revolt from the whole field with a sense of disgust, only increased by the reflection how much good might be done were these hateful passions subdued, and the charities of our nature cultivated for the benefit of that torn and miserable country.

Such being the impression on our mind, we must frankly state, that any publication involving matter of the kind to which we allude, be it of past or present date, finds us extremely indisposed to devote our attention to its claims. All that is biographical in Mr. Grattan's book is well enough; but indeed we cannot embark in the "Irish revolution of 1782," nor meddle with the antecedent events for a century which preluded and led to it. The author's desire to raise in public estimation the character and services of his father's friends and coadjutors is filial and laudable; but we must leave where we see them the names of Malone, Pery, Flood, Lucas, Burgh, Daly, and the rest.

The particulars of Mr. Grattan's parentage, birth, education, and the chief incidents of his life, may be learnt from every biographical sketch; and we shall, therefore, content our selves with selecting a few passages which illustrate familiar affairs, and well serve to exhibit the character of the work:—

"The debates and discussions in a writ of parliament, and the various proceedings connected with carrying the measure of free trade, had given new life to the people; they began to awaken, and the country became, in some degree, roused to a sense of her situation: men at last thought they had a country; but the upper classes still remained cautious and timid. By the aid, however, of the patriotic party in Dublin, resolutions and addresses were circulated through the country. Mr. Grattan drew up several, and they were proposed at the respective meetings by the Volunteers. The high principle and sentiment which they breathed, the temperate and firm tone in which they spoke to the people, diffused a national spirit throughout all classes. Men now wondered at their former tameness and systematic

depression; they, at length, dared to think they belonged to a nation, and that their country should be free. When these virtuous sentiments had taken root and spread around, Mr. Grattan thought the season had arrived for bringing on the question of independence. But here he found all his party opposed to him. They all censured him for his rashness and imprudence. Messrs. Burgh, Daly, Ogle, Pery, and the Ponsonbys, were adverse: they could not be seduced, but they were mollified and afraid. Lord Charlemont, too, was rather timid; but he evinced a delicacy on the occasion which well became him, and for which he deserved great credit; for he did not, like the rest, seek to dissuade Mr. Grattan from bringing forward the question,—he only recommended him to consider it well; he thought the measure too bold, and the country not yet ripe for it. Mr. Fitzgibbon, though he had been friendly to free trade, was hostile to the question of independence. Some had offered to oppose the measure; many had yielded; and the government had nearly softened them all; so that they would have remained satisfied with the measures the country had got; for they had gained credit by them, and they feared to risk their reputation, and put to sea again on such a stormy ocean. The efforts of the lord-lieutenant were strenuous; the orders from England imperative; '*obstare in limine*' was the principle to be adopted,—if necessary to be acted on, and if an opening was afforded, to be enforced with every severity. The commands from St. James's, as the letters of the ministers shew, were to resist every alteration in the constitution, and not even to transmit any such bills to England. In the midst of this political chaos, one man remained unmoved, unterrified, undaunted—John Forbes."

Lord Charlemont is thus described:—

"Lord Charlemont was the most accomplished man of his day; the most polished and the most agreeable. He was, in these respects, superior to any person that had yet appeared in Ireland, or, probably, that Ireland will ever again behold. His society was charming; he had the art to make every place and every company agreeable; and his conversation was so delightful, that it disarmed all reflection. He was fond of humour, and liked sometimes to be severe, and occasionally indulged in sarcasm, but never on his company. He was full of spirit, of integrity, and of public virtue. He possessed ambition; a great love of fame; a great contempt for money,—the consideration of which never entered into his mind. He was incorruptible. He was one of the few Irish peers who loved liberty; and it may be truly said, that he was not only the first of those peers, but the only one among them who gave dignity to his station. His spirit and integrity would not permit him to yield to government; but when the people had triumphed, he strove to reconcile the parties, and would not abandon the government on a question which endangered it. One predominant feature in Lord Charlemont's character was, a sacred attachment to the British connexion; his desire was to keep well with England; and he worked in favour of government, not for this or for that minister, but for the government solely; and was not only anxious to have the people supporting him, but to have the people supporting the government. The prejudice of party led some to say, that he was nothing more than a polished man with exquisite manners, but they were mistaken; he was a man of excellent sense, and possessed a better judgment than many persons allowed him. He was at the head of a

most powerful national army, supported by the upper classes, and comprising all. He assisted in leading them on to civil liberty; he assisted also in guarding them against popular excesses; and, in both cases, he deserved the greatest credit, in both he rendered the greatest services to his country. He was flattered into the chair at the Rotunda, and joined the Convention in 1783; and he certainly still kept with the people, although the people had broken with the parliament; he favoured their addresses, and attended their meetings, and thus contributed to uphold them. But, though he seemed to encourage them in their error, yet he was thereby enabled to moderate, if not to control and guard, the Volunteers against any violent extreme, or any excess which would have tarnished the high reputation they had deservedly acquired. It was most fortunate that such an individual existed. His grave and civil character was necessary to restrain the ardour of the Volunteers, and rescue them from their own excesses; for he well knew that liberty loses half its value if it is purchased by a victory over the people. There are times and there are occurrences when a man ought to stop, and should rather prefer to break with his party than go forward; yet few men who have acquired popularity possess courage enough to risk its loss. But Lord Charlemont did so—he hazarded his popular fame, at the most critical period, and rendered thereby a lasting service to the empire. His principles were noble as his mind was patriotic: he possessed an abhorrence of every thing that was low and base, and instantly gave up his borough when the question of Reform was under consideration; tendering to the people that which had hitherto been considered as private property. Lord Charlemont was at once a patriot and a courtier; he loved the people, and possessed at the same time taste and manners that would have adorned a court. He afforded a rare instance of such a union, and would have done honour to old Greece in her best of times. He was certainly not devoid of vanity; but if he had the defects that attend it, he had the virtues also. His keeping clear of the Court—his declining to accept office—and his lead among the Volunteers, established him in the minds of the people, and gave him an everlasting reputation. Lord Charlemont wrote well; his replies to the addresses from the Volunteers are excellent,—and while they encouraged their spirit and formation, they gave a regulated tone to liberty. He was a good Latin scholar, and knew Greek remarkably well. He had travelled much, and was well versed in the continental languages. He was fond of poetry, and composed some light and pretty things. His intimacy with the Bishop of Waterford (Marlay) encouraged this pastime; and their mutual taste led them to an epistolary correspondence, partly verse, partly prose, full of humour, railery, and wit. Lord Charlemont had formed a club, which was called the '*Society of Granby Row*.' It was political as well as convivial, and Messrs. Grattan, Burgh, Langrishe, Yelverton, Doyle, and Sir Edward Newenham, were some of the principal members. It served the public cause, and assembled men who possessed inclination and ability to propose plans and digest measures for the advancement of their country. The Catholic question was Lord Charlemont's weak point; he was at first unfavourable to their claims, and objected at an early period to their getting the elective franchise, when a measure of that description was in contemplation in 1785. The county that he belonged to was violent against them; and one of his ancestors

had lost his life at the period of the civil wars in 1641. But his mind relaxed in 1703, and he did not oppose the measure; and prior to the close of his life, he became friendly to the great question of Catholic Emancipation. Lord Charlemont's name will live as long as virtue, spirit, and patriotism, are esteemed."

The origin of the Union is ascribed to a Mr. Ogilvie:—

"The only charge which was ever brought against the Duke of Portland as to his sincerity, was that which arose from the conversations which he was said to have had with Mr. Ogilvie, on the subject of a union between the two countries. This, however, is capable of being explained. It happened that Mr. Ogilvie, who was connected with the Leinster family, and at that time in Parliament, but of no other influence, had applied to Lord Charlemont upon this subject, which was but the chimera of his own brain. The kindness of Lord Charlemont had induced him to reply to questions which never should have been put, and which merited no answer. He, and he alone, mentioned the subject in private, and had a sort of blind meddling communication upon it with the lord lieutenant. But it was not even broached in public, nor would Mr. Ogilvie have dared to mention the subject there. Full of his own importance, he strove to make the duke believe that he had made an impression on Lord Charlemont. The weakness of the duke readily gave in to this supposition, and served to shew, not that he was insincere, which was afterwards charged against him, but that he was only weak, which his after-conduct in 1795 unfortunately exemplified. In fact, neither Mr. Fox nor the English government had any thing to say to the chimerical idea, which was barely conceived, never reduced to form, which would not have been listened to if openly mentioned, and which was solely attributable to the folly and intermeddling of Mr. Ogilvie. In the discussion on the Union in 1799, Mr. Pitt, however, urged the point, in order to shew that the proceedings in 1782 were not final, and that even then a union was meditated. But his statement was neither fair nor just; for he attributed to the question of right that which related to the question of trade. Ireland had settled the question of independent legislature, just as England had her Magna Charta, or the principles of her revolution of 1688; but matters of commerce were those that might have admitted of regulation, and were those referred to in the resolutions of parliament, and distinctly stated in the letter of the Duke of Portland. But a disingenuous mind, or a skillful minister, can easily pervert the plainest terms, and misinterpret an honest transaction; and thus the dexterity of Mr. Pitt applied the resolution, not to the subject of commerce, but to that of the constitution."

The volumes bring down the history to the year 1783, and therefore we presume we may expect two more volumes; but even when they are finished, the author can never close his labours with a better sentiment than occurs at the end of the first epoch—"All that Ireland now wanted was *Repose*." Yes, indeed, it is all that she has wanted, and does want, to make her prosperous and happy. Well might she exclaim with the bard—

"Leave, O leave me to repose."

It is her great desideratum: the cure for nearly all her sufferings. But the theme is not for us, and we finish with a couple of personal anecdotes:—

"In 1767, Mr. Grattan lost his sister Catherine, whom he most loved. His feelings, on

this occasion, were those of intense grief; and he wrote upon her death in a strain of the most passionate and despairing affection. His sorrow for her loss, and his love for the country, led him from the scenes of London. He chose the spot that Pope has immortalised in verse; and took up his abode at Sunning Hill, near Windsor Forest. His delight was to ramble through the groves and green retreats of that charming solitude. His passion in the country—his perpetual pursuit—was politics. His mind was wholly engrossed with their object; he thought of nothing else; and his attendance on both houses of parliament seemed to have riveted his mind to the subject. Mr. Grattan's manner at this time was so singular, that, at one of the places where he resided with his friend Day, the landlady imagined, not only that he was an eccentric character, but that he was deranged; and she complained to one of his friends that the gentleman used to walk up and down in her garden most of the night, speaking to himself; and, though alone, he was addressing some one on all occasions by the name of 'Mr. Speaker'; that it was not possible he could be in his senses, and she begged they would take him away; and that if they did, she would forgive him all the rent that was due!"

And the friend of his youth, Mr. Day, writes:—

"We lived in the same chambers in the Middle Temple, and took a house in Windsor Forest, commanding a beautiful landscape: he delighted in romantic scenery. Between both, we lived together three or four years, the happiest period of my life. I am angry that, in your introductory life of him, you are altogether silent of those years, so variegated and full of adventure and enterprise. However, I admit that it could not be expected, or even desired, that in so brief a sketch you should have noticed much of his private history. When we resided in Windsor Forest, he would spend whole moonlight nights rambling and losing himself in the thickest plantations. He would sometimes pause and address a tree in soliloquy, thus preparing himself early for that assembly which he was destined in later life to adorn. One morning he amused us at breakfast with an adventure of the night before, in the forest. In one of those midnight rambles he stopped at a gibbet, and commenced apostrophising the chains in his usual animated strain, when he suddenly felt a tap on his shoulder, and, on turning about, was accosted by an unknown person—"How the devil did you get down?" To which the rambler calmly replied—"Sir, I suppose you have an interest in that question!"

Reliquæ Antiquæ. Scraps from Ancient Manuscripts, illustrating chiefly Early English Literature, and the English Language. Edited by Thomas Wright, Esq., M.A., F.S.A., &c., and James Orchard Halliwell, Esq., F.R.S., F.S.A., &c. No. I. 8vo. London, 1839. Pickering.

WE hail with much satisfaction this little publication, as being likely to answer two good purposes:—on the one hand, to collect much curious materials from widely scattered sources to illustrate the history of our language and literature; and, on the other, to call attention to, and excite interest in, a really important subject, which has hitherto been too much neglected.

The first publications of our early literature were made by those who considered nothing but the subjects of the works they edited, and

who gave to the world only a few noted productions, such as Chaucer, Gower, Lidgate, Piers Plowman, and others; of all which the texts were utterly disfigured and corrupted by the carelessness with which they chose the manuscript they used, and with which they followed that which they had chosen. A little later, people began to think that these old poems were curious on account of the language itself, and then they used some more care in editing them: but still this attention was paid only to words, and not to forms of words; and so little care was taken of the *literal* accuracy of the texts, and particularly of the final letters, that until we come down to a very recent period no printed editions of old English books are of any use to the philologist. Nothing could be worse executed than the editions of Robert of Gloucester and Robert of Brunne, by Hearne, printed at the beginning of the last century. Percy and Warton scarcely made any pretensions to philological accuracy. Ritson himself was more frequently pedantic than correct.

The exclusive partiality which has generally been exhibited for poetry, has caused our early prose literature to be undeservedly neglected: it possesses frequently as many beauties and other attractions as the verse, and gives us as much light on the manners and sentiments of our forefathers. This, and the peculiar tendency of the form in which such publications have hitherto been published, to restrict them to one or two classes of subjects, has been the cause that those who are partial to such studies, and have not frequent opportunities of pursuing them in the original manuscripts, can, from printed books, only form a very partial acquaintance with the literature of our early forefathers. It is the object of the present publication to obviate, as much as possible, this deficiency, by giving a collection of short inedited pieces on all subjects, whether prose or verse; and we cannot conceive a more acceptable offering to every one who loves to carry his researches retrospectively into the ages that are gone by. We think that the names of the editors are a sufficient guarantee for the good arrangement and correctness of this little work; and we cannot do better than state their views in their own words:—

"The object of the publication, of which the first number is now laid before the public, is to collect together such pieces from ancient inedited manuscripts illustrative of the literature and languages of our forefathers during the middle ages, as are not of sufficient extent to form books by themselves, and, from their want of connexion, do not easily find a place in other publications. To those whose attention has been given to the subject, it will be unnecessary to say that these shorter pieces are often of much greater importance than those which are more extensive. The largest proportion of these pieces will be in the English language, in some of the stages through which it passed from the pure Anglo-Saxon to the form in which we now speak it; but, from the nature of the subject, a fragment must now and then be admitted in Latin and Anglo-Norman, languages which were once as familiar to our countrymen as their own vernacular tongue. The contents of the first number will give the best notion of the design of this work. It has been endeavoured to produce it in a cheap and commodious form; and as much care as possible will be taken to ensure correctness. It is only necessary to add, that the editors most earnestly invite the aid of all who take interest in the subject; and they trust that their work may thus be the means of bringing

to light many curious documents of middle-age literature, which would otherwise have been lost or neglected. It is intended to publish the numbers about once in every three months."

We cannot easily conceive a greater variety than is presented to us in the first number of this work, which contains twenty-five different articles, and affords specimens of our language at almost every period from the times of the Saxons up to the period of the Reformation. These extracts bear on a variety of subjects. Even the history of science finds an illustration in a curious early receipt for making gunpowder. We have a variety of popular songs, and among the rest the earliest English sea-song that has yet been discovered. The history of our forms of public worship is illustrated by copies of the Lord's Prayer and the Creed, as written at different periods in the tenth, thirteenth, and fourteenth centuries. The lexicography of our language receives illustration in different ways, and among others by old glosses, which assist us in fixing exactly the original meanings of various English words, as well as by a glossary of old law terms, and another of names of plants, both from manuscripts of the thirteenth century. The latter forms a curious link in the history of our popular botanical nomenclature. We will only add, that one of by no means the least interesting articles in this number is a Latin poem by the famous Abelard, which has never before been published. We wish every success to the undertaking.

Captain Marryat's America.

[Diary concluded.]

THE second volume finds our traveller at Washington, from his notices of which capital and seat of legislation we shall select but one extract:—

"There are three things in great request amongst Americans of all classes,—male, I mean,—to wit, oysters, spirits, and tobacco. The first and third are not prohibited by act of Congress, and may be sold in the capital, but spirituous liquors may not. I wondered how the members could get on without them, but upon this point I was soon enlightened. Below the basement of the building is an oyster-shop and refectory. The refectory has been permitted by Congress upon the express stipulation that no spirituous liquors should be sold there, but law-makers are too often law-breakers all over the world. You go there and ask for pale sherry, and they hand you gin; brown sherry, and it is brandy; madeira, whisky; and thus do these potent, grave, and reverend signors evade their own laws, beneath the very hall wherein they were passed in solemn conclave. It appears that tobacco is considered very properly as an article of fashion. At a store, close to the hotel, the board outside informs you that among fashionable requisites to be found there, are gentlemen's shirts, collars, gloves, silk-handkerchiefs, and the best chewing-tobacco. But not only at Washington, but at other large towns, I have seen at silk-mercers and hosiers this notice stuck up in the window—'*Dulcissimus* chewing tobacco.' So prevalent is the habit of chewing, and so little, from long custom, do the ladies care about it, that I have been told that many young ladies in the South carry, in their work-boxes, &c., pig-tail, nicely ornamented with gold and coloured papers; and when their swains are at fault administer to their wants, thus meriting their affections by such endearing solicitude."

The next chapter bolts to Upper Canada, whence there is a return by the far west Wisconsin, Winnebago, the Missouri, Mississippi, and Ohio, the Prairies, the Sioux, and so on to the end. From this grand tour we shall take a few specimens of the amusing and descriptive. Of Irish immigration the author speaks sportively, but when we view the subject in the important light cast upon it by Sir R. W. Horton, we could have wished that a gentleman of Captain Marryat's sagacity had pointed out the immense value of such an outlet to an overgrown and starving population. He, however, tells us, laughingly:—

"Once more on board of the Michigan, one of the best vessels on Lake Erie; as usual, full of emigrants, chiefly Irish. It is impossible not to feel compassion for these poor people, wearied as they are with confinement and suffering, and yet they do compose occasionally about as laughable a group as can well be conceived. In the first place, they bring out with them from Ireland articles which no other people would consider worth the carriage. I saw one Irish woman who had five old tin tea-pots; there was but one spout among the whole, and I believe not one bottom really sound and good. And then their costumes, more particularly the fitting out of the children, who are not troubled with any extra supply of clothes at any time! I have witnessed the seat of an old pair of corduroy trousers transformed into a sort of bonnet for a laughing fair-haired girl. But what amused me more was the very reverse of this arrangement: a boy's father had just put a patch upon the hinder part of his son's trousers, and cloth not being at hand, he had, as an expedient for stopping the gap, inserted a piece of an old straw bonnet; in so doing he had not taken the precaution to put the smooth side of the plait inwards, and, in consequence, young Teddy when he first sat down felt rather uncomfortable. 'What's the matter wid ye, Teddy? what makes ye wriggle about in that way? Sit aisy, man; sure enough, havn't ye a straw-bottomed chair to sit down upon all the rest of your journey, which is more than your father ever had before you?' And then their turning in for the night; a single bed will contain one adult and four little ones at one end, and another adult and two half-grown at the other. But they are all packed away so snug and close, and not one venturing to move, there appears to be room for all."

Once fairly settled down, and with industry, what comfort awaits them, where even the youngest can be of use, and nature is prodigal of her bounties? Of the customs of the Sioux, Captain M. mentions some of considerable curiosity, of which we do not remember to have read before. For example:—

"In many customs the Sioux are closely allied to the Jewish nation; indeed, a work has been published in America to prove that the Indians were originally Jews. There is always a separate lodge for the women to retire to before and after childbirth, observing a similar purification to that prescribed by Moses. Although there ever will be, in all societies, instances to the contrary, chastity is honoured among the Sioux. They hold what they term virgin feasts, and when these are held, should any young woman accept the invitation who has by her misconduct rendered herself unqualified for it, it is the duty of any man who is aware of her unfitness, to go into the circle and lead her out. A circumstance of this kind occurred the other day, when the daughter of a celebrated chief gave a virgin feast: a young

man of the tribe walked into the circle and led her out; upon which the chief led his daughter to the lodge of the young Sioux, and told him that he gave her to him for his wife, but the young man refused to take her, as being unworthy. But what is more singular (and I have it from authority which is unquestionable), they also hold virgin feasts for the young men; and should any young man take his seat there who is unqualified, the woman who is aware of it must lead him out, although in so doing, she convicts herself; nevertheless it is considered a sacred duty, and is done. The shells found in the western rivers are very interesting. I had promised to procure some for Mr. Lee, of Philadelphia, and an old squaw had been despatched to obtain them. She brought me a large quantity, and then squatted down by my side. I was seated on the stone steps before the door, and commenced opening and cleaning them previous to packing them up. She watched me very attentively for half an hour, and then got up, and continued, as she walked away, to chuckle and talk aloud. 'Do you know what the old woman says?' said the old Canadian interpreter to me. 'She says, the man's a fool; he keeps the shells, and throws the meat away.' The French Canadians, who are here employed by the Fur Company, are a strange set of people. There is no law here, or appeal to law; yet they submit to authority, and are managed with very little trouble. They bind themselves for three years, and during that time (little occasional deviations being overlooked) they work diligently and faithfully; ready at all seasons and at all hours, and never complaining, although the work is often extremely hard. Occasionally they return to Canada with their earnings, but the major part have connected themselves with Indian women, and have numerous families; for children in this fine climate are so numerous, that they almost appear to spring from the earth."

At Fort Snelling, our countryman encountered a mighty hunter, one Captain Scott, who seems to have outrivalled Uncle Sam or Colonel Crockett. Among his sporting exploits when a boy, he relates the following:—

"I was once buffalo-hunting in Arkansas: I was on a strong well-trained horse, pursuing a bull, when we arrived at a rent or crack in the prairie, so wide, that it was necessary for the animals to leap it. The bull went over first; and I, on the horse, following it close, rose on my stirrups, craning a little, that I might perceive the width of the rent. At that moment the bull turned round to charge: the horse perceiving it, and knowing his work, immediately wheeled also. This sudden change of motion threw me off my saddle, and I remained hanging by the side of the horse, with my leg over his neck: there I was, hanging on only by my leg, with my head downwards below the horse's belly. The bull rushed on to the charge, ranging up to the flank of the horse on the side where I was dangling; and the horse was so encumbered by my weight in that awkward position, that each moment the bull gained upon him. At last my strength failed me; I felt that I could hold on but a few seconds longer: the head of the bull was close to me, and the steam from his nostrils blew into my face. I gave myself up for lost: all the prayer I could possibly call to mind at the time was the first two lines of a hymn I used to repeat as a child: 'Lord, now I lay me down to sleep!' and that I repeated two or three times, when, fortunately, the horse wheeled short round, evaded the bull, and leaped the gap. The bull was at

fault. The jolt of the leap, after nearly dropping me into the gap, threw me up so high, that I gained the neck of my horse, and eventually my saddle. I then thought of my rifle, and found that I had held it grasped in my hand during the whole time. I wheeled my horse and resumed the chase, and in a minute the bull was dead at my horse's feet."

The hymn by way of prayer is a laughable hit: Mr. Murray has not so naïve a touch in all his buffalo adventures (see last *Lit. Gas.*). The general description of the alluvial lands called prairies is striking:

"After you proceed south of Prairie du Chien, the features of the Mississippi river gradually change: the bluffs decrease in number and in height, until you descend to Rock Island, below which point they are rarely to be met with. The country on each side now is chiefly composed of variegated rolling prairies, with a less proportion of timber. To describe these prairies would be difficult; that is, to describe the effect of them upon a stranger. I have found myself lost, as it were; and, indeed, sometimes, although on horseback, have lost myself, having only the sun for my guide. Look round in every quarter of the compass, and there you are as if on the ocean—not a landmark, not a vestige of any thing human but yourself. Instead of sky and water, it is one vast field, bounded only by the horizon, its surface gently undulating like the waves of the ocean; and as the wind (which always blows fresh on the prairies) bows down the heads of the high grass, it gives you the idea of a running swell. Every three or four weeks there is a succession of beautiful flowers, giving a variety of tints to the whole map, which die away, and are succeeded by others equally beautiful; and, in the spring, the strawberries are in such profusion, that you have but to sit down wherever you may happen to be, and eat as long as you please."

"An American was asked what game they had in his district? and his reply was, 'Why, we've plenty of *baar* (bear) and deer, but no *large* game to count on.'"

Of Cincinnati, planted on such a soil, we are told,—

"In 1803, deer-skin at the value of forty cents per pound were a legal tender; and, if offered instead of money, could not be refused, even by a lawyer. Not fifty years ago, the woods which towered where Cincinnati is now built, resounded only to the cry of the wild animals of the forest, or the rifle of the Shawnee Indian: now Cincinnati contains a population of 40,000 inhabitants. It is a beautiful, well-built, clean town, reminding you more of Philadelphia than any other city in the Union. Situated on a hill on the banks of the Ohio, it is surrounded by a circular phalanx of other hills; so that, look up and down the streets, whichever way you will, your eye reposes upon verdure and forest-trees in the distance. The streets have a row of trees on each side, near the curb-stone; and most of the houses have a small frontage, filled with luxuriant, flowering shrubs, of which the *Althea Frutes* is the most abundant. It is, properly speaking, a Yankee city, the majority of its inhabitants coming from the East; but they have intermarried, and blended with the Kentuckians of the opposite shore,—a circumstance which is advantageous to the character of both. There are, however, a large number of Dutch and German settlers here; they say 10,000. They are not much liked by the Americans; but have great influence, as may be conceived when it is stated that, when a motion was brought forward in

the Municipal Court for the city regulations to be printed in German as well as English, it was lost by one vote only. I was told a singular fact, which will prove how rapidly the value of land rises in this country as it becomes peopled. Fifty-six years ago, the major part of the land upon which the city of Cincinnati stands, and which is now worth many millions of dollars, was swapped away by the owner of it for a pony!! The man who made this unfortunate bargain is now alive, and living in or near Cincinnati. Cincinnati is the pork-shop of the Union; and in the autumnal, and early winter months, the way in which they kill pigs here is, to use a Yankee phrase, *quite a caution*. Almost all the hogs fed in the oak forests of Ohio, Kentucky, and Western Virginia, are driven into this city, and some establishments kill as many as fifteen hundred a-day; at least, so I am told. They are despatched in a way quite surprising; and a pig is killed upon the same principle as a pin is made,—by division, or, more properly speaking, by combination of labour. The hogs confined in a large pen are driven into a smaller one; one man knocks them on the head with a sledge-hammer, and then cuts their throats; two more pull away the carcass, when it is raised by two others, who tumble it into a tub of scalding water. His bristles are removed in about a minute and a half by another party; when the next duty is to fix a stretcher between his legs. It is then hoisted up by two other people, cut open, and disembowelled; and in three minutes and a half from the time that the hog was grunting in his obesity, he has only to get cold before he is again packed up, and reunited in a barrel, to travel all over the world. By the by, we laugh at the notion of pork and molasses. In the first place, the American pork is far superior to any that we have ever salted down; and, in the next, it eats uncommonly well with molasses. I have tasted it, and 'it is a fact.' After all, why should we eat currant jelly with venison, and not allow the Americans the humble imitation of pork and molasses? Mrs. Trollope's bazar raises its head in a very imposing manner: it is composed of many varieties of architecture; but I think the order under which it must be classed is the preposterous. They call it Trollope's Folly; and it is remarkable how a shrewd woman like Mrs. Trollope should have committed such an error. A bazar like an English bazar is only to be supported in a city which has arrived at the acme of luxury; where there are hundreds of people willing to be employed for a trifle; hundreds who will work at trifles, for want of better employment; and thousands who will spend money on trifles, merely to pass away their time. Now, in America, in the first place, there is no one who makes trifles,—no one who will devote their time, as sellers of the articles, unless well compensated; and no one who will be induced, either by fashion or idleness, to give a halfpenny more for a thing than it is worth. In consequence, nothing was sent to Mrs. Trollope's bazar. She had to furnish it from the shops, and had to pay very high salaries to the young women who attended; and the people of Cincinnati, aware that the same articles were to be purchased at the stores for less money, preferred going to the stores. No wonder, then, that it was a failure: it is now used as a dancing academy, and occasionally as an assembly-room."

With regard to the future prospects of the West, the following is also important:—

"I have often heard it asserted by Englishmen, that America has no coal. There never

was a greater mistake: she has an abundance, and of the very finest that ever was seen. At Wheeling and Pittsburgh, and on all the borders of the Ohio river above Guyandotte, they have an inexhaustible supply, equal to the very best offered to the London market. All the spurs of the Alleghany range appear to be one mass of coal. In the Eastern States, the coal is of a different quality, although there is some very tolerable. The anthracite is bad, throwing out a strong sulphureous gas. The fact is, that wood is at present cheaper than coal, and therefore the latter is not in demand. An American told me one day, that a company had been working a coal-mine in an eastern state, which proved to be of a very bad quality; they had sent some to an influential person as a present, requesting him to give his opinion of it, as that would be important to them. After a certain time he forwarded to them a certificate, couched in such terms as these:—'I do hereby certify that I have tried the coal sent me by the company at —, and it is my decided opinion, that when the general conflagration of the world shall take place, any man who will take his position on that coal mine will certainly be the last man who will be burnt!'"

The metals, iron, copper, &c., also abound in these regions; but we cannot do better than conclude with the characteristic quotation we have just copied. The *Essays* upon various subjects, to which the *Diary* is a prelude, may possibly claim from us a future review.

MISCELLANEOUS.

Cranmer. By a Member of the Roxburgh Club. 3 vols. 12mo. London, 1839. Colburn.

It is a mad world. An old Roxburgher setting up for a modern novel-writer! The attempt is monstrous. *Cranmer* is, accordingly, like no other Novel that ever was penned;—a novel with prolegomena and foot-note references;—a novel with book notices and bookish reminiscences of the martyr Cranmer. Partly in England, and partly in Germany, is society sketched, and the plot unravelled. Many of the scenes are rather sketches of people than necessary to the story; and the whole is indeed a medley composition. The talent of the writer is shewn in pertinent and shrewd remarks, and the filling up is better than the framework.

Sermons Preached before the University of Oxford, in St. Mary's Church, in 1837, 8, 9, by the Rev. S. Wilberforce, M.A. Pp. 198. (London, Burns.)—Six sermons, worthy of the preacher and of his auditors.

The Forest Planter and Pruner's Assistant, &c., by J. Main, A.L.S. Pp. 261. (London, Ridgway.)—A very useful and practical adviser in the management of forest trees. Engraved figures illustrate both the scientific and more common branches of the subject.

Black's Economical Tourist—Scotland. Pp. 49. (Edinburgh, A. and C. Black.)—A very useful little *it*, with map, routes, and short descriptions.

Leda; or the Island, by Ann Fraser Tytler, author of "Mary and Florence," &c. Pp. 278. (London, Hatchard.)—A pious little work, inculcating reliance on the Supreme Power.

A Reply to the Rev. Dr. Turtton's "Roman Catholic Doctrines of the Eucharist Considered," &c., by N. Wiseman, D.D. 8vo. pp. 264. (London, Dolman.)—A controversial work on the real presence, &c. &c., which we leave to readers not satisfied with the expositions in the "Tale of a Tub."

Costanzas of Misra: a Tale of Modern Greece. Pp. 164. (London, Whittaker and Co.)—In five cantos, Byronian style; in favour of which, we fear, we cannot go far. The attempt has been pleasing to the writer.

Manners and Ends; or, Self-Training, by C. M. Sedgwick, author of "Redwood," &c. Pp. 378. (London, Tilt.)—Written for the young women of America, this little volume is no inappropriate offering to the young women of England. It is full of good advice and judicious observation.

The Little People's Portrait, &c. by Miss G. M. Sterne. Pp. 128. (London, Houlston and Stottman; Bath, Buiss and Goodwin.)—Meant for very young intellect, and not over-well done.

Preservation of the Teeth, by J. Gray, Dentist. Pp. 77. Many practitioners now-of-days publish little treatises to bring themselves into notice. The design is not illaudable, where there is so much competition; but there is seldom much new in them, and this follows the general rule.

The Lord's Prayer, &c., by the Rev. Thomas Griffiths, A.M. Pp. 178. (London, J. Burns; Hamilton, Adams, and Co.)—Commentaries on this beautiful prayer, as expressing the primary elements of devoutness in the human breast approaching the Great Creator.

ARTS AND SCIENCES.

GEOLOGICAL SOCIETY.

JUNE 5. The Rev. Dr. Buckland, President, in the chair.—Four communications were read:—1. A paper by Captain J. B. Martin, of Ramsgate, 'On Remains of the Mammoth dredged up in the English Channel and German Ocean.' The fishermen employed off the east coast of England are frequently impeded in their operations by large boulders and bones of mammalia becoming entangled in their tackle; and, in order to clear their fishing-grounds of such obstructions, they bring the masses on shore. The animal remains noticed in this paper are chiefly in the possession of the author, and consist of tusks, teeth, and bones of the mastodon. They were obtained between Dungeness and Boulogne, Dover and Calais, and Yarmouth and the coast of Holland; and Captain Martin states that they were wholly procured in hollows, or submarine valleys. The boulders are also accumulated in depressions, and consist of a great variety of rocks. Some of them are much worn or rounded, but in no instance do they present those regularly shaped forms which would lead to the inference that they might have composed part of shipwrecked cargoes. To this communication was appended a note by Sir John Trevelyan, 'On a Molar of an Elephant, found thirty-eight years ago in the bed of the Severn, near Watchett.' The same gentleman has also informed Dr. Buckland that Roman pottery has been frequently procured, during the last fifty years, from the bottom of the estuary of the Thames, near Margate; and that Pot Island, off Heme Bay, has received its name from the quantity of similar remains obtained near it. A Roman vessel laden with pottery is supposed to have been wrecked at this spot.—2. 'A Description of Five Fossil Trees found in the Excavations for the Manchester and Bolton Railway,' by Mr. J. Hawkshaw. One of these trees was discovered in 1837, and the other four during the present year, in forming a drain. They are situated in a nearly straight line, in beds of slate belonging to the great Lancashire coal-field; and the distance between the first and the fifth is about 106 feet. The roots, as far as they have been exposed, are spreading, and they are apparently quite conformable in position to the inclination of the stratum in which they are imbedded. The stems are nearly at right angles to the plane of stratification, and were enveloped, when discovered, in a thin coating of friable coal. The internal argillaceous casts are fluted; and Mr. Hawkshaw states that there are indications of a fibrous structure. The largest tree is 11 feet high, 15 feet in circumference at the base, and 7½ at the top. The others vary in height from 6 to 2½ feet, and in circumference, at the thickest part, from 9 to 6 feet; but the girth is not always proportioned to the height. The roots of one of the largest specimens extended between 5 and 6 feet from the trunk. A thin stratum of coal was cut through on the same plane as that of the roots, and, on excavating on the opposite side of the railroad, the seam was also found at the distance of about ten yards. In the immediate neighbourhood of the roots the shale com-

tained so great a number of *Lepidostrobus variabilis*, that more than a bushel of specimens was collected. Of the generic characters of the trees, Mr. Hawkshaw offers no opinion, as the coal which occupied the place of the bark was too friable to permit the external markings to be determined: he, however, alludes to the opinion of M. Adolphe Brongniart, that the *Lepidostrobus variabilis* was the organ of fructification of a species of *Lepidodendron*. Mr. Hawkshaw has not only prevented the trees being removed from the position in which they were discovered, but he has had them protected from the weather; and he invites geologists to examine the interesting phenomena which they present.—3. 'A Notice of some Organic Bodies recently procured from the London Clay,' by Mr. Wetherell. These fossils were first observed by the author in nodules of indurated clay, obtained from the excavations for the Birmingham Railway, between Euston Square and Kilburn. Of their true nature he offers no opinion, leaving the determination open to future research. Some of the specimens consist of flat flabelliform bodies, more or less corrugated on the surface, and covered with minute oviform grains, in close contact with each other. Several of the specimens are cylindrical and branched, varying in diameter from half an inch to less than a tenth; and they are likewise wholly or partially covered with the egg-shaped grains. Besides these fossils of a definite form, Mr. Wetherell has procured a multitude of others perfectly amorphous. They are generally of a dark colour, and are, for the most part, without apparent internal structure; but they occasionally consist of concentric lamellae. The granules are not unfrequently dispersed through the substance of the specimen, or they are collected in irregular patches on the surface. A series of these bodies, illustrative of the memoir, has been presented to the Society's Museum by Mr. Wetherell.—4. 'On the Relations of the different parts of the Old Red Sandstone in the Counties of Murray, Nairn, Banff, and Inverness,' by Mr. Malcolmson. In 1838, Mr. Malcolmson announced to the Society, that Mr. Martin, of Elgin, had procured from the lowest division of the old red sandstone, near that town, remains of several species of fishes characteristic of the formation in other districts. With the exception of the ichthyolites found at Gamrie, in a series of beds now proved to belong to the same system, the Elgin remains were the only fossils known to exist in the old red sandstone south of the Murray Firth, at the time Mr. Malcolmson, the Rev. G. Gordon, and Mr. Stables, discovered the specimens noticed in this communication. The district in which these fishes were found extends from the village of Buckie, near Cullen, in Banffshire, to Ouldoun Moor, six miles south of Inverness. The higher and southern parts of the counties are composed of gneiss and other crystalline schists, traversed by numerous granite veins. The old red sandstone system, which occupies the greater part of the lower tracts, Mr. Malcolmson divides into three portions. The lowest consists of conglomerates, derived from the gneiss and associated rocks, and it contains fishes of the genera *Dipterus*, *Chirocentrus*, *Coccoleus*, &c. It is considered by the author to represent the old red series of the Orkneys, Caithness, and Gamrie, in Scotland, and the "tile stone," or lowest part of the English old red system. The middle division is composed of marly conglomerates and sandstones, containing calcareous concretions. It is characterised by a distinct suite of fossil fishes, many of which are

undescribed, and must be assigned to new genera. Mr. Malcolmson places this division on the parallel of the central strata of the old red sandstone to the south of the Grampians, and in England. The uppermost series of beds consist of siliceous conglomerates and sandstones, in which no fossils have yet been detected. The paper contains detailed sections of all the localities examined by the author; and he hopes soon to give full descriptions of the singular fishes found in the central division. This being the last meeting of the session, the Society adjourned, at the close of the evening's business, to the 6th of November.

ENTOMOLOGICAL SOCIETY.

JUNE 3. The Rev. W. Kirby, Honorary President, in the chair.—Various donations of entomological works were announced, and thanks ordered to be returned to the donors thereof. Members were elected. The Rev. F. W. Hope described a plan for the extirpation of the species of *Anobis*, which is found very abundantly in carved wood-work imported from the Netherlands. Various species of insects were exhibited by Messrs. Bainbridge, Fennell, and Saunders. Mr. Westwood detailed the proceedings of one of the saw-flies (*Tenthredinidae*), which he had observed in the act of flying over and depositing its eggs in the blossoms of the apple at Hammersmith. In the preceding summer the entire crop of fruit had failed, in consequence of the interior of the young fruit having been infested with the larva of a saw-fly; and he now had no hesitation in considering that the winged insects, recently observed, had been produced from some of these last year's larva.—The following memoirs were read: 1. 'Descriptions of a New Holland Species of *Bolbecerus*,' in the collection of the Rev. F. W. Hope, by Mr. W. Bainbridge. 2. 'Experiments on Old Honey-combs, with a view to determine the Substance of which they were composed,' by W. Sells, Esq. 3. 'Some Account of the Preparatory States of *Xiphidris Dromodarius*, with Observations upon its Affinities,' by Mr. Westwood. A discussion (in which Messrs. Kirby, Hope, Marshall, and others, took part) ensued, originating in the circumstance of so many species of *Bolbeceri*, of very large size, being inhabitants of New South Wales, where, owing to the absence of the larger quadrupeds, the existence of coprophagous insects of any size might have been doubted.

July 1. The Rev. F. W. Hope in the chair.—Various donations of books and insects were announced, and thanks ordered to be returned to the several donors. Several new members were balloted for and elected. Mr. Barrand exhibited a very small wasp's nest, found attached to the inside of a sparrow's nest: from the very minute size of the cells in its interior, and the nature of the external envelope, it was considered by Messrs. Waterhouse and Shuckard that it could not have been made by any hitherto described British species of *Vespa*. It was stated that Mr. Raddon had procured more specimens of the magnificent *Goliathus Drurii*, from vessels trading to Africa. Mr. W. Bennett exhibited a living specimen of *Calosoma Sycophanta* captured on the coast of Kent, and which had been kept alive by feeding it upon moths. Mr. Westwood exhibited some remarkable beetles belonging to the Mexican genus *Chaotus*; the males of which, contrary to the ordinary rule among insects, greatly exceeded the females in size. He also exhibited a species of his genus *Elymnos* (*Choriphetum are.*), the type of

which had so greatly the appearance of the genus *Membrana*, as to have misled Linnaeus, who accordingly placed it amongst the *Cicada*, although in reality belonging to a different order. Mr. Hope exhibited a splendid collection of insects from Assam, some of which were of very great beauty and interest, and of which he read the descriptions.

BOTANICAL SOCIETY.

JULY 5, Mr. J. E. Gray, President, in the chair. —Living specimens of *Salvia pratensis* collected at Cobham, Kent, were exhibited by Mr. Sanson. Read, the 'Details of the first Excursion taken this Summer, by the President and Members of the Botanical Society of London,' by Mr. G. E. Dennes, F.L.S., Secretary. The excursion was made early in June, to Mickleham and Box Hill, Surrey, and thence to Norbury Park. A large collection of plants was obtained; amongst them several rare ones:—*Aceras anthropophora*, *Orchis muscifer*, *Hippocrepis comosa*, *Cynoglossum sylvaticum*, *Veronica montana*, *Anthyllis vulneraria*, &c. &c.

LITERARY AND LEARNED.
UNIVERSITY INTELLIGENCE.

CAMBRIDGE, July 1.—Degree of Bachelor in the Civil Law was conferred on the Rev. J. Walker, of Trinity Hall.

The Rev. J. R. Oldham, M.A., of Oriel College, Oxford, was admitted as *audens* of this university.

July 2 (being Commencement Day), the following Doctors and Masters of Arts were created:—

Doctors in Divinity.—Rev. E. Rice, Trinity College; Rev. H. Stebbing, Rev. P. R. Hall, St. John's College; Rev. S. Fennell, Queen's College; Rev. R. Wilson, Rev. G. Wightman, St. John's College; Rev. W. Scarsby, Queen's College; Rev. G. Bosworth, Trinity College; Rev. C. Wesley, Christ's College; Rev. G. Dodds, Pembroke College; Rev. M. Seaman, Queen's College; Rev. G. Dodds, Catharine Hall.

Doctors in the Civil Law.—A. F. Bayford, Trinity Hall; Rev. D. B. Langley, St. John's College, and Vicar of Olney, Bucks.

Doctors in Physics.—G. F. Evans, T. P. Parr Marsh, J. Andrew, Caius College; M. A. N. Crawford, Trinity College; W. Mitchell, Emmanuel College.

Masters of Arts.—R. A. Denton, C. O. Goodford, A. Long, King's College; H. Watkins, J. F. Robinson, R. Chamberlain, R. Cooper, M. Amphlett, St. Peter's College; M. Wilkinson, P. Sheppard, P. W. Yorke, A. Adcock, A. Ramsey, P. Bealhouse, Guss Hall; C. A. Cartwright, E. Shortland, J. Jackson, W. D. B. Berles, N. Keymer, E. W. Milner, W. G. Hotten, Pembroke College; C. Parker, W. Blunt, W. J. Johnson, H. Henderson, J. Tozer, H. Howes, C. Clayton, W. B. Wilkins, R. A. Hurle, J. Fernie, Caius College; J. R. W. Hale, C. E. Broome, Trinity Hall; W. R. Parker, H. H. Higgins, C. Hart, E. H. Landon, J. Patterson, Corpus Christi College; J. Clark, W. Bruce, H. E. Preston, T. Sedger, Queen's College; E. Crow, J. Stackhouse, B. Hayfield, J. H. Carnegie, T. Miles, E. Kelly, T. Dalaty, J. May, J. Robinson, W. H. King, Catharine Hall; D. T. Amsted, S. B. Smyth, H. J. Daubeny, C. J. Hilton, T. W. Levenshorpe, P. W. Courtney, Jesus College; R. Burney, W. G. Greenstreet, H. F. Bacon, W. Bates, J. Courpe, C. T. J. Baines, G. A. Walker, J. Hart, C. Green, Christ's College; W. H. Bateson, J. D. Lane, F. W. Collins, C. E. Hoare, J. D. Gilbert, T. J. Clark, A. Christopher, W. Johnson, C. J. Cartwright, T. F. Cooke, D. Ledman, G. H. Marsh, A. W. H. Rose, R. Sale, E. Bennett, A. Smith, W. H. Coleman, W. S. Salmon, H. Barlow, R. Francis, H. W. Beadon, R. Barber, J. W. Colenso, W. Wilkinson, R. M. Phelps, H. T. Davies, J. Chapman, J. Lawson, J. G. Uwins, J. H. Henderson, St. John's College; H. H. Swamy, P. Jones, J. Buckley, J. Nelson, W. Lowe, W. H. Owen, J. Wood, R. W. Dayrell, Magdalene College; S. E. Girdlestone, J. O. Sanger, H. Browne, W. T. Turner, M. A. Atkinson, R. Wilson, A. Smith, J. I. Smith, W. L. Coxhead, W. Conway, F. Custance, O. Walford, C. J. Selwyn, G. E. L. Cotton, J. B. Palmer, J. S. Mansfield, A. Bisset, G. W. Smyth, G. D. Johnston, T. C. Browne, R. J. St. Aubyn, W. A. Radcliffe, W. F. G. Farmer, E. L. Clarke, F. I. Nicholl, J. R. Goodman, F. V. Vyvyan, G. J. Lloyd, W. Greenleade, W. Tennant, W. C. Frampton, W. J. Parkes, T. P. Methuen, G. B. Gregory, W. A. Osborne, S. Turner, J. C. Campbell, A. Helps, W. L. Palmer, R. Prescott, T. E. Heslham, F. E. Curry, H. James, J. W. Woodfall, G. Richards, P. W. Mayon, R. B. Adams, L. Arthur, E. H. Denison, C. Powell, T. A. Hadley, E. Masco, C. W. Hardy, S. Thornton, C. B. Hine, W. Pigeon, A. Hunter, J. H. Tinnis, W. F. Matfield, T. B. Page, Trinity College; J. C. Barker, C. W. Robinson, F. Legard, J. M. Wilker, W. C. Roughan, H. R. Gilbert, Emmanuel College; J. T. H. Smith, C. J. Furlong, M. G. Lamotte, E. Bickneth, Sidney Sussex College; P. H. Frere, Downing College.

July 5th, at the last day of term, the degree of Bachelor of Arts was conferred on J. F. Sharpe, of Sidney Sussex College.

ROYAL SOCIETY OF LITERATURE.
Anglo-Saxon Literature.

WE continue our quotation from Mr. Wright's interesting paper; selecting its more popular illustrations.

"No class of popular literature was so general a favourite among the Anglo-Saxons as enigmas and riddles, and they form an important part of the literary remains of our forefathers. Collections of Anglo-Latin *Ænigmata*, such as those of Aldhelm, were composed at a very early period. They were imitations of a still older Latin tract of this description, which was also popular among the Anglo-Saxons, under the title of '*Symposii Ænigmata*,' and which has been frequently printed; but whether this title implies that it was written by a person named *Symposium*, or whether it only means that they are '*symposiaca enigmata*,' or, as we might say, 'nuts to crack over our wine,' is a question among the learned; though the introductory lines would lead us to conclude that they were written with a view to this latter object. They have sometimes been attributed, but apparently without any good reason, to Lactantius. The riddles in this collection are expressed in triplets; they are often so contrived as to convey information under the cloak of amusement, and they sometimes present us with an elegant sentiment or a pretty idea. The subject of the following is a ship:—

Longa feror velox formosae filia silvae,
Immuera pariter comitum stipante caterva;
Curro vias multas vestigia nulla reliquens.

The idea contained in the following is not new:—

Est nova nostrarum cunctis captura ferarum,
Ut squalid capias et tu tibi ferre recuses,
Et quod non capias tecum tamen ipse seportas.

The subject of the next is a violet. In the second line there seems to be a pun in the word *spiritus* which has not the odour of great antiquity about it.

Magna quidem non sum, sed hest mihi maxima virtus;
Spiritus est magnus, quamvis sis corpore parvo;
Nec mihi germen habet noxam, nec culpa ruborem.

Some of these enigmas are curious, as illustrating incidents of private life. The subject of the following, which bears a different title in different manuscripts, is certainly some kind of liquor composed of three principal ingredients: according to the gloss in the margin of the oldest manuscript, these were honey, wine, and pepper.

Tres olim fulminis qui nomine jungimur uno,
Ex tribus est unus, tres et miscetur in uno;
Quisque bonus per se, melior qui continet omnes.

Aldhelm confesses that he was but an imitator of *Symposium*; but his enigmas are deficient in that simplicity of sentiment and expression which he found in his models. There needs no greater proof how complicated and far-fetched they are, than the immense number of glossarial explanations with which they are accompanied in the MS. preserved in the British Museum. The following, perhaps, possesses as much simplicity as any we could select, but the last line is a remarkable specimen of that sinking in poetry of which the writer has often cause to plead guilty. Its subject is the wind.

Cernere me nulli possunt nec prendere palmis,
Arcum vocis crepitum nec pando per ortem,
Viribus horrore valeo confingere puerum,
Nam superos ego pulso polos, et rura peragro.

The next is so peculiarly literary, that, although it needs some explanation, we can hardly pass

it over. Its subject is the alphabet: it will perhaps be enough to say that in the third line *ferro* is explained in the gloss by *stilo graphico*, that the *terris fratres* are the three fingers which hold the pen, and the *incerta mater* the pen itself, 'it being uncertain whether this were a crow or goose quill, or a reed.'

Nos dene et septem gentis sine voce sorores,
Sed alie cothes non dictam adamandam,
Necdum ex ferro rursus ferro moribunda,
Necnon et volucris pennis volitantis ad æthram:
Terri nos fratres incerta matre creantur;
Qui cupit instantem altius audire, docemus,
Tum cito prompta damus roganti verba silentur.

But by far the most curious and interesting collection of early enigmas that exists, is the large one in Anglo-Saxon verse, which occupies a considerable portion of the Exeter manuscript. From their intentional obscurity, and from the uncommon words with which they abound, many of these riddles are at present altogether unintelligible; but where they can be translated with any certainty, they are by no means devoid either of beauty or interest."

"The Higher Branches of Science.—

It has been already observed that science, as cultivated by the Anglo-Saxons, was almost entirely founded upon older foreign authorities. One of the most popular of these authorities was Isidore, a Spanish Christian, who lived at the beginning of the seventh century, and who published a manual of science under the title of '*De Naturis Rerum*,' as well as a larger work entitled '*Etymologia*,' or '*Origines*,' which is a kind of nomenclature, accompanied with definitions of nearly every thing that existed, from the highest attributes of the Deity, through all the different regions of science and art, down to the most insignificant of children's games. In the higher branches of science, the Saxons followed principally those writers of the time of the Roman empire, who were then peculiarly styled 'the philosophers;' such, for example, as Macrobius and Apuleius. Boetius, and the Anglo-Saxon scholars of that and the following age, quote frequently such writers as Dionysius Exiguus, and Victor Aquitanus. The popularity of certain treatises appears, in some cases, to have arisen from their accidental introduction into England at an early period. This, perhaps, was the case with Cicero's translation of '*Aratus*,' and the prose '*Astronomica*' of Hyginus which accompanies it; in the Harleian library are preserved a few leaves of what may have been the very copy of this work that was first brought into our island; for it seems to have been written in the seventh, or early in the eighth century; the pictures bear every mark of having been painted by a foreign artist, and there can be little doubt that it was the prototype of the other manuscripts of the same book which were written in England in the ninth and tenth centuries, although neither in the text nor drawings are they absolutely literal copies. *Aratus*, in Cicero's Latin version, and Hyginus, were the chief authorities of the Anglo-Saxons, not only for the forms and positions of the constellations, but also for the details of Grecian and Roman mythology, with which their names were so closely connected. The scientific writings of Boethius do not appear to have been much read till the latter end of the Anglo-Saxon period. Geometry is found in the Anglo-Saxon lists of sciences; but to what extent, or in what form, it was studied, we have no very certain indications. Tradition, in after-times, gave to the reign of King Athelstan the honour of the first introduction of Euclid's '*Elements*,' although we are not acquainted with any English manu-

script of that work which belongs to an earlier date than the twelfth century, when it was translated into Latin by Athelard of Bath. It seems probable, indeed, that the Anglo-Saxons, when they spoke of geometry, understood nothing more than simple mensuration; and we have no reason for believing that they had any acquaintance with mathematics as a pure and abstract science. The great dissensions about the true time of celebrating Easter, which had been felt so severely by the Anglo-Saxon church, had given a peculiar turn to numerical calculations. The object which many of the early Anglo-Saxon scholars had chiefly in view in their visits to Rome, was not more to obtain a knowledge of the arguments by which the Romish church there defended its doctrine on this subject, than to learn the calculations on which its variations depended; and on their return, they made a powerful use of both in their controversies with the partisans of the contrary system. These calculations were long afterwards the business of the arithmeticians (*rym-craefte*), and those who were skilful in 'circle-craft,' (on *circule-craefte*); and the Anglo-Saxon manuscripts of all periods are filled with tracts and tables connected with this all-engrossing subject, under the title of 'De Computo,' or 'De Computo Ecclesiastico.' The Anglo-Saxons rather took notice of, than observed, the various phenomena of the heavens. They were interested in them simply so far as they were supposed to influence the seasons which were favourable or otherwise to the husbandman or the sailor; or with an eye to their more mystical connexion with the destinies of individuals or of kingdoms. Anglo-Saxon manuscripts abound in tables of prognostications of the weather, and of the good or bad influence of the lunar and solar changes. Although sea-faring men were the chief observers, yet even they confided so little in the certainty of such prognostications, that, rather than trust to them, they preferred choosing the two calmest months of the year, June and July, called, on that account, the earlier and later sailing-months (*liðe-monað*), for their longer voyages. Some of the best scholars not only suspected that there were errors in the authorised astronomical calculations, but were extremely puzzled by accidental observations, which disagreed with the statements of the books they followed. In the year 798, considerable sensation was caused upon the continent by the planet Mars, which, under certain circumstances, had been found to remain beneath the horizon much longer than it should have done, according to 'the books of the philosophers.' In answer to a letter from Charlemagne, Alcuin, after entering at some length into the subject, goes on to observe:—'However, what has now happened to the planet Mars alone, the same thing is frequently observed in these parts with respect to all the five planets, namely, that they remain longer under the horizon than is stated in the books of the ancients which are our guides. And perhaps the rising and setting of the stars, as observed by us who dwell in these northern parts, vary from the observations of those who live in the eastern and southern part of the world, where chiefly flourished the 'masters' who set forth for us the laws and courses of the heaven and of the planets. For many things are changed, as your own wisdom knows perfectly well, by diversity of place.' Alcuin's modern editor conjectures, from this passage, that the Anglo-Saxon scholar had made such great advances in the study of science as already to suspect the true form of the earth. It is

certain that observations made systematically with moderately good instruments, in pursuance of the train of reasoning which Alcuin here states, would have led to its discovery. The passage shows, at all events, that the wisest of the Anglo-Saxons were conscious of the imperfections of the system they were pursuing. To some scholar of the tenth century, we owe a comprehensive treatise in the Anglo-Saxon language on the principal astronomical phenomena, designedly explained in a simple manner, and calculated for the level of ordinary capacities. From the numerous copies which still remain of this work, we may conclude that it was extremely popular in its day. Yet it has hitherto been scarcely noticed by modern scholars, and indeed it is not unfrequently found buried among collections on the computus, so as very easily to escape attention. This tract gives us a very fair, and on the whole a very favourable, view of the popular science of the period when, among the Anglo-Saxons, knowledge was in such treatises diffused among the many, instead of being restricted in a learned language to the few. The writer of this book begins by stating that night is the effect of the earth's shadow, when the earth itself is between us and the sun. After explaining the moon's changes, as a matter arising naturally out of the former subject, he goes on to tell us how, from sunset to sunrise, the night is divided into seven parts, namely—1. twilight, or 'evening's gloaming'; 2. evening; 3. the hour of silence, when every thing goes to rest (*conticinium*); 4. midnight; 5. cock-crowing; 6. dawn; 7. daybreak, or the period which intervenes between dawn and sunrise. The account of the year, and its seasons, divisions, and duration, leads to the definition of the lunar, as contradistinguished from the solar year, and this affords us a remarkable specimen of the popular mode of explaining science which was used by our forefathers: 'Now,' says the writer, 'you may understand that the man who goes round one house, makes a lesser course than he who goes round the whole town; and so the moon has his course to run sooner on the lesser circuit than the sun has on the greater; this is the moon's year.'

FINE ARTS.

DAGUERROTYPE.

On Sunday last, M. Daguerre exhibited several productions of the Daguerrotype in one of the halls of the Chamber of Deputies. There were views of three of the streets of Paris, of the interior of M. Daguerre's studio, and of a group of busts from the Musée des Antiques. The extraordinary minuteness of such multiplied details as was shewn in the street views, particularly in that of the Pont Marie, was much admired. The slightest accidental effects of the sun, or boats, the merchandise on the banks of the river, the most delicate objects, the small pebbles under the water, and the different degrees of transparency which they imparted to it,—every thing was reproduced with incredible exactness. The astonishment was, however, greatly increased when, on applying the microscope, an immense quantity of details, of such extreme fineness that the best sight could not seize them with the naked eye, were discovered, and principally among the foliage of the trees. In the view of the studio, all the folds in the draping, and the effects of light and shade produced by them, were rendered with wonderful truth. The head of Homer, which is the principal figure in the picture (representing many ancient sub-

jects), retained a very fine character, and not one of the beauties in the sculpture was lost in this reproduction, notwithstanding the difference in the size, which is considerable. The preparation on which the light acts by M. Daguerre's process is spread on a copper plate. All the pictures exhibited in the Chamber were nine or ten inches in height, and six or seven in breadth. The value of a copy of this size is fixed by M. Daguerre at three francs and a half; and he calculates that the apparatus necessary to produce pictures of these dimensions would cost about four hundred francs in the first instance, but has no doubt that the perfection of the method of fabrication would soon reduce this price in a sensible manner.—*The Quotidienne*.*

We should several weeks ago have announced to our readers that Mr. Talbot had succeeded in getting the lights and shades of his photographic copies in the natural order. We have several specimens in our possession, which are perfectly accurate and quite beautiful.

NEW PUBLICATIONS.

Carlisle Cathedral. From Drawings by R. W. Billings. Part I. Boone.

ALTHOUGH Carlisle Cathedral is, as a whole, far from being one of the most grand and imposing ecclesiastical edifices in the country; its antiquity renders it venerable; and many of its parts are exceedingly curious and beautiful. Of this latter circumstance, Mr. Billings has very successfully availed himself in the publication before us, which cannot fail to be interesting both to the architect and to the antiquary. The plates are executed with great neatness; and there is an effect of sunny light in several of them which is very pleasing.

Outlines of Celebrated Works from the best Masters of Ancient and Modern Sculpture. No. XV. Murton.

THE publication of this pretty and useful little work (which was some time ago noticed in our columns), is proceeding with increased rather than with diminished ability and interest. When completed, it will form a valuable volume for the artist or lover of art.

MUSIC.

Mr. Bochea's Concert, at the Opera House, on Friday afternoon, was very fully attended; and the entertainments well warranted a crowd. Mario sang a scena from "Lucrezia Borgia" with exquisite taste and feeling; and Rubini, Tamburini, and Lablache, delighted us with pieces from "Lucia di Lammermoir" and the "Matrimonio Segreto." Mrs. Bishop sang with great effect in character; and Persiani, Pauline Garcia, and others, enriched the vocal treat by some charming contributions. In the instrumentation, Bochea and his harp shone brilliantly; and Thalberg and Döhler shewed of what the piano-forte is capable. While we have thus to praise every thing in the performances, we have to reprimand, in the severest language, the rapacity and pillage exercised by the box-keepers on such of the company as could not find room in the pit.

* It appears, by the French papers, that the pension required by M. Daguerre, as the condition of his disclosing his secret, has been voted by the Chamber of Deputies. We trust, therefore, that no impediment will now be thrown in the way of a speedy and unreserved development of the whole process. The sum voted to Daguerre is 6000 francs (240*l.*) a-year; and to M. Niepce, the son of the gentleman whose claim to the first discovery of the art was brought forward in the *Literary Gazette*, 4000 francs (160*l.*) a-year. M. Arago's Report on the subject reached us since the above was written, but we found it too long to translate for our present Number.

Upon them these harpies pounced, and a regular sale of accommodation was carried on. Places offered for a guinea were bated to a crown: and no sooner were the purchasers seated than they were ousted for higher bidders, and moved from box to box, so long as the extortion could be practised. This evil has grown to a most offensive pitch, and especially at this theatre. It is full time it were put down! To the end of the concert a number of boxes remained empty!

VARIETIES.

Charterhouse Square Infirmary.—When the interests of humanity render an appeal to the public expedient, it has ever been the anxious wish of this Journal to raise its voice in furtherance of the good cause. It is one of the most useful and delightful powers enjoyed by the press to do so; and on this ground we beg to direct the attention of our readers to an advertisement (headed as above), in our columns of to-day. We might be eloquent in the mass of suffering alleviated by this excellent charity on the number of our fellow-creatures restored by it to health and comfort from states of the severest pain and all but hopeless misery. It is not, however, our task to work on the feelings of the community. There is a noble abundance of benevolence in this Christian land, and of sympathy in the sorrows of the afflicted, whosoever it appears, that either can be exercised for a truly laudable object. We therefore content ourselves with referring to the advertisement in question; of bearing testimony to the admirable management of this Infirmary; and of saying, that much as it has done, and continues to do, its funds are insufficient for carrying on, to any thing like the desirable and requisite extent, the cure of a class of the most excruciating diseases that can embitter existence, and which are chiefly spread among the poorer orders of society.

Dinner to Mr. Macready.—We learn that a dinner is to be given to Mr. Macready next Saturday, in honour of his noble efforts in behalf of the national drama; at which H.R.H. the Duke of Sussex will preside, and be supported by Lord Normanby, Sir E. Bulwer, Sergeant Talfourd, and other eminent literary characters. We are sorry to observe that sufficient publicity does not appear to have been given to this design. Its mere indication, however, ought to be enough to rally every friend of the stage round the illustrious president; and we trust such will be the result, though certainly the matter ought to have been more widely promulgated.

Hampton Court.—A notice has been issued that the royal apartments will in future be closed on the Friday in each week, instead of Saturday, as heretofore. All our readers are not, perhaps, aware of the number of new and interesting pictures now exhibited at Hampton Court, and the excellent rearrangement of the whole gallery. It is particularly rich in old portraits.

Praet's Exhibition of Gothic Armoury has been closed, and most of the armour appropriated for the grand tournament at Eglinton Castle.

Royal Botanic Society.—Next Saturday has been appointed for a promenade in the grounds of this new Society, in the inner circle of the Regent's Park, for the purpose of exhibiting rare, new, and extraordinary plants, paintings, models, and drawings of plants, botanical works, geological specimens, agricultural and horticultural implements, agricultural and manufacturing productions, and architectural orna-

ments; decorations for rooms, and drapery of all kinds, in which representations of flowers or foliage are introduced. Productions of the arts or manufactures connected with the science of botany are invited to be sent.

H. B. has begun another century in capital style, No. 601, 2. The first is naval, "A Ship in Distress," the crew throwing the cargo overboard. The vessel is named, on the stern, "The Whig Radical," and below is inscribed "Melbourne, O'Connell, and Co." His lordship is at the wheel, calling out to throw every thing overboard to keep her afloat; which order is obeyed by Lord Normanby throwing over the Jamaica Bill, where Lord Glenelg is already over and struggling with the waves; Lord J. Russell and the Chancellor of the Exchequer are hoisting over the Irish Corporation Bill; the Irish Railroad, Resolution on Canada, and government plan of education being already floating in the waters. Other ministers are looking with terror to a visionary Cerberus-looking rock, with the countenances of Wellington, Peel, and Stanley (we believe). On the other side, and above, is a cloud—Brougham, whence the tempest proceeds, and "The Times" behind in another portentous shape. The whole is full of imagination, and certainly one of the finest of these caricatures. "The Indian Juggler" is the title of the next, and a very amusing group. O'Connell is the showman, Mr. Macaulay the juggler, seated on the ground and playing the balls, whilst the ballot-box and a sword, marked "the whole hog," are near him, ready for new tricks. Lord Melbourne, and the Queen hanging on his arm, are spectators, and Brougham is telling Peel that he (the Premier) is in partnership with the jugglers, which he knows, as he was once in the concern himself. On the other hand, John Bull is beset by Mr. Rice, with the begging-hat, and Lord John beating the tambourine: the Chancellor tries to get a donation, by assuring John that swallowing the sword is to come next. Mr. Grote and Mr. Hume also appear. It is not unworthy of its immediate numerical precursor.

Parisian Statistics.—In 1837, the births amounted to 29,192; the deaths to 28,135: increase, 1058. The number of illegitimate children was 9573, or nearly one-third of the whole. The marriages were 8366.

British Association.—The riotous proceedings of the Chartists at Birmingham seem to militate against the approaching meeting of the British Association in that town. It is however to be hoped that quiet will be restored before the date of the meeting, and that it will itself have a beneficial effect upon the conduct of the misguided portion of the population.

The Mirror (Vol. XXIII. Lambird), as heretofore, looks more rich in illustrations and materials when collected together than could be expected, even from the goodly appearance of the single Numbers. It continues to be conducted with enterprise and judgment.

No. VII. of Mrs. Loudon's Ladies' Flower Garden (London, W. Smith) preserves every character of grace and beauty. The silene, or catch-fly, with its pretty blossoms; the more brilliant dianthus; the gay tropeolum; and several other very elegant flowers, embellish this Number.

Impromptu, after hearing a Sermon.
"Religion, where'er she extended her sway,
Made the ignorant wise, and the barbarous civil,"
The elderly bodies cry—Well a day!
I wonder what next will his reverence say,
For he's got to the Barber of Seville!—S. H. H.

LITERARY NOVELTIES.

Russian Literature.—In the department of poetry and the belles lettres, in the strict sense of the term, Russian literature furnished in 1838 but a scanty harvest. Pairy collections of verses and petty novels may with propriety be left out of the account, though their number this year was not smaller than usual. Upon the whole, Russian poetry appears for the moment, if not on the decline, at least in a weakly state. Puschkin and Dimitrieff are dead; Jukowsky and Barilinski have given up writing; Countess Rostopschin, who promised fairly, seems to have cooled in her zeal; Benedictow, instead of producing separate works, contents himself with contributing to journals, and thus fritters away his talent; and no fresh poets come forward. A tragedy by Polewoi, Ugolino, has been very successful on the stage, but does not stand the test of perusal in the closet. Among the recent novels there is scarcely any worth mentioning, but "The Seducer," by Sagoesken; nearly all the others are more or less faithful and happy imitations of French novels, especially of Balzac's. During the past year, a taste for illustrated editions has been strongly manifested in Russia. Instead of importing such books from France and England as they formerly did, the Russians themselves now produce them. This, however, applies only to the text, for France furnishes the copperplates and the woodcuts, as in the case of the "Don Quixote" and the illustrated Bible, published by Pluchart. This is the place to mention also the "Pantheon of Contemporaries," which contains a series of biographical sketches, accompanied with portraits. The splendid edition of Karamsin's History is a truly national work; the lithographic portraits belonging to it are, upon the whole, well executed. All these illustrated editions are warmly encouraged in Russia, and several enterprises of the kind are in preparation. In regard to translations, it may suffice to observe that the most remarkable new French, English, and German works, have made their appearance in a Russian dress; if there are to be found among them many indifferent novels, dramas, vaudevilles, &c., this is not to be wondered at. The total of the works translated into Russian, in 1838, amounts to 300; but the original works is about 700; which disproportion is still very considerable, but yet shews a favourable progress, since not long ago the proportion of original works to translations was the very reverse.—"Leipzig's Borsenblatt." [Quoted in Paris and London Advertiser.]

LIST OF NEW BOOKS.

 London: John Green, 121 Newgate Street.

8vo. 7s. 6d.
TWELVE SERMONS, delivered in the New Temple of the Israelites at Hamburg.
 By Dr. GOTTHOLD SALOMON.
 And Translated from the German by ANNA MARIA GOLDMID.
 "Among the motives which have led to the publication of these Sermons, is the hope that from their perusal many of our Christian countrymen may derive a better knowledge of the astonishing faith of the Jews. To these Sermons I confidently ask the attention of the kindly and conscientious Christian. I may add, that many of them may be found available for persons of every religious denomination and sect. If in religious discussion, men of all creeds would seek, not points of difference, but points of agreement, how much of the strife and bitterness that deform God's earth would disappear!"—*Traveller's Review.*
 John Murray, Albemarle Street.

Post 8vo.

NEW WORKS, JUST PUBLISHED by
RICHARD BENTLEY, Publisher in Ordinary to Her Majesty.

I.
The Hon. C. A. Murray's Travels in North America,

During the Years 1834, 1835, and 1836.
Dedicated, by special permission, to the Queen.
2 vols. 8vo. with Plates.

II.
Precaution.

By the Author of "The Pilot," "The Spy," &c.
New edition, revised by the Author, complete in 1 vol. embellished with Engravings, price 6s.

Forming the New Volume of

The Standard Novels and Romances.

*. This new edition of Mr. Cooper's earliest work of fiction has been revised throughout by the author, expressly for the Standard Novels. The copyright has been assigned to Mr. Bentley by Mr. Cooper.

Also, in a few days,

I.
Hamilton King.

By M. H. Barker, Esq. ("The Old Sailor"),
Author of "Tough Yarns," "Land and Sea Tales," &c.
2 vols.

II.

Victories of the British Army.

By W. H. Maxwell, Esq.
Author of "Stories of Warlike," &c.
2 vols. 8vo. with characteristic Illustrations and Portraits.

LADY CHATTERTON'S NEW WORK.

RAMBLES in the SOUTH of IRELAND,
in 1838.

By LADY CHATTERTON.
"This is a charming book, full of picturesque descriptions, interesting observations on life and manners, amusing anecdotes, legendary lore, just feeling, and sound common sense."—*Literary Gazette*.

"The production of an accomplished and amiable woman, desirous that others should reap as much benefit to their health and spirits as herself, from a visit to the neglected sister-island."—*Examiner*.

Saunders and Otley, Publishers, Conduit Street.
Agents—for Ireland, J. Cunningham; Dublin: for Scotland, Bell and Bradfute, Edinburgh.

18 Great Marlborough Street, July 12.

MR. COLBURN has just published the following NEW WORKS.

I.
The Life and Times of the Right

Hon. Henry Grattan.

By his Son, Henry Grattan, Esq. M.P.
2 vols. 8vo. with Portrait, &c.

II.

Temptation; or, a Wife's Perils.

3 vols.

III.

Capt. D. H. O'Brien's Adventures during the late War.

Comprising a Narrative of Shipwreck, Captivity, and Escape from French Prisoners, &c. from 1804 to 1807.
Dedicated, by permission, to Her Majesty.
2 vols. 8vo. with Illustrations.

IV.

The Lion; a Tale of the Coteries.

3 vols.

V.

The Conclusion of
The Diary of the Times of George IV.
Being Vols. III. and IV. comprising numerous curious and interesting Letters of Queen Caroline, the Princess Charlotte, &c.

VI.

Cranmer; a Novel.

3 vols.

Also, just ready,

The Courtier of the Days of Charles II.

By Mrs. G. G. G.
Henry Colburn, Publisher, 18 Great Marlborough Street.

ETON SELECTÆ E VETERI TEST.

SELECTÆ E VETERI TESTAMENTO HISTORIÆ. Ad Usus Scholæ quæ Latine Lingue Radicem imbuunt. Editio nova, prioribus emendatior.

This Book is used in the Lower Forms at Eton, and will be found well adapted for the use of Youth, the Selection consisting of the most interesting and instructive Portions of the Historical Part of the Old Testament, intended to convey to the youthful mind both pleasure and profit.
Eton: Excudebat E. P. Williams; apud quem veniunt etiam Londini, 185 Fleet Street; et J. G., et F. Rivington; Longman et Socio; Simpkin et Marshall; Hamilton et Socio; Houlston et Stoneham; et Gal. Merrison.

REVIEW OF NEW BOOKS.

Introduction to the Literature of Europe in the Fifteenth, Sixteenth, and Seventeenth Centuries. By Henry Hallam. Vols. II. III. and IV. 8vo. London, 1839. Murray.

It is now about two years since we reviewed the first volume of this work, which, in its complete form, is not only one of the most important that has issued from the press for many years, but it is, we have no hesitation in saying, sufficient of itself to make the lasting and substantial reputation of its author. The work of years of patient research, it exhibits a full illustration of one of the most interesting periods of literary history that the world has yet witnessed, and must be henceforth the constant companion of the scholar, and indeed of every well-educated gentleman.

The age to which Mr. Hallam's first volume was more peculiarly devoted, namely, the fifteenth, and first half of the sixteenth centuries, was a period of preparation. The earlier national literature of the different nations of Europe had by degrees dwindled away, and, except the traces which it had left among the lower orders of people, had disappeared from the scene; but it had left impressions and effects which were to administer to, and in some measure to influence the character of, a new intellectual movement. It is a curious circumstance, that the period of the Reformation, and the revival of learning in the west of Europe, was preceded by a dark age of nearly a century, which, preceded itself by a period of comparative brightness, presents scarcely a single name in literature that is worthy to be remembered. But it is still more singular, that to this very period of intellectual depression we owe the invention of printing, which was destined to be the main instrument of the change that was approaching. The first great benefit which the press conferred upon literature, was by spreading abroad numerous copies of the ancient classics. Previous to the year 1550, the greater number of works of any importance which had appeared in print were classical writers, or theological treatises. Before that period the works printed in the vernacular tongue were comparatively of small importance.

In the latter half of the sixteenth century, the mind had thrown off the shackles with which its movements had been embarrassed, and, disdaining the old beaten tracks, people began to explore new roads in literature and science. Throughout Europe, the great characteristic of the literature of this age is its remarkable inequality. Among innumerable writers, whose merits are of a very low scale, and many of whom are utterly contemptible, we meet with some of the most lofty geniuses that modern times have produced. It was during this age that appeared, in Italy, Tasso; in Portugal, Camoens; and in England, Spenser and Shakspeare. It was, in fact, the peculiar age, when a few men appeared who far outstripped their contemporaries; and, which is equally remarkable, these men seem to have been but ill-appreciated by their contemporaries, who were not yet capable of judging of their superior excellence. Of this we may cite the example of Camoens, in Portugal. In our

own country, except among a few individuals, it may be doubted whether the poetry of Spenser was rated above that of such doggerel writers as Churchyard; and every reader is aware how many paltry dramatists stole the palm from immortal Shakspeare. The seventeenth century presents to our view a long period of great and continued efforts; and to it almost every country in Europe owes a large proportion of its standard literary productions.

Mr. Hallam's book is not only a great addition to literature, but at the same time it fills up an absolute void. The chief books we have hitherto had on literary history have been dry bibliographies, or partial treatises, many of which were either written by men who had more taste than learning, or who had more learning than taste or judgment; or, not unfrequently, who were deficient in both. Mr. Hallam's book is far from aiming at being in any measure bibliographical; he has mapped out literature and learning into different periods and different branches; and he dwells, with considerable detail, on the characteristics and on the merits of each, and of its principal writers and works. He has undertaken a very extensive field, and he was compelled by its magnitude to seize the most striking and prominent parts as points to dwell upon, subjecting himself, perhaps, here and there, to the charge of omission; but he could not have done otherwise, without either becoming too brief in his details, and so reducing his book to little better than a list of writers and their works; or, on the other hand, of making his own work far too bulky. It might, for instance, be made a subject of complaint, that he has neglected the English mathematicians of the first half of the seventeenth century—such as Cavendish and Pell, the friends and correspondents of Hobbes, Descartes, Roberval, and Gassendi. Such omissions as this are, however, in a book of this character, easily excused.

The arrangement of Mr. Hallam's book is extremely judicious, and nothing can be more happy than his general criticisms. Our extracts must, from its nature, be very indiscriminate; and we give the preference to such passages as are least connected with what precedes or follows. The first chapter of the second volume—which volume includes the period from 1550 to 1600—is devoted to classical literature, which, at the beginning of this period, still held the place of highest importance. We think there is much justice in the following remarks, which arise out of the mention of such names as Turnebus, Victorinus, and Muretus:—

“Those who now, by the glancing at a note, obtain the result of the patient diligence of these men, should feel some respect for their names, and some admiration for their acuteness and strength of memory. They had to collate the whole of antiquity; they plunged into depths which the indolence of modern philology, screening itself under the garb of fastidiousness, affects to deem unworthy to be explored, and thought themselves bound to become lawyers, physicians, historians, artists, agriculturists, to elucidate the difficulties which ancient writers present. It may be doubted

also, whether our more recent editions of the classics have preserved all the important materials which the indefatigable exertions of the men of the sixteenth century accumulated. In the present state of philology, there is incomparably more knowledge of grammatical niceties, at least in the Greek language, than they possessed, and more critical acuteness perhaps in correction, though in this they were not always deficient; but for the exegetical part of criticism—the interpretation and illustration of passages, not corrupt, but obscure—we may not be wrong in suspecting that more has been lost than added in the eighteenth and present centuries to the *savans* in us, as the French affect to call them, whom we find in the bulky and forgotten volumes of Gruter.”

From classical learning, Mr. Hallam proceeds to theology, as being now, at and soon after the period of the Reformation, peculiarly interesting and important. At the middle of the sixteenth century, and during some years after, the Protestant doctrines had made considerable progress in several countries of Europe, such as Austria, Italy, and Spain, where they soon afterwards began to decline, as they did also a little later in France. In fact, throughout Europe, the general zeal which had distinguished this party at the immediate period of the Reformation, began to subside, and the popish party only to take courage and to redouble its zeal in spreading and supporting the papal influence.

“This great reaction of the papal religion, after the shock it had sustained in the first part of the sixteenth century, ought for ever to restrain that temerity of prediction so frequent in our ears. As women sometimes believe the fashion of last year in dress to be wholly ridiculous, and incapable of being ever again adopted by any one solicitous about her beauty; so those who affect to pronounce on future events are equally confident against the possibility of a resurrection of opinions which the majority have for the time ceased to maintain. In the year 1560, every Protestant in Europe doubtless anticipated the overthrow of Popery; the Catholics could have found little else to warrant hope than their trust in heaven. The late rush of many nations towards democratical opinions has not been so rapid and so general as the change of religion about that period. It is important and interesting to inquire what stemmed this current? We readily acknowledge the prudence, firmness, and unity of purpose, that for the most part distinguished the court of Rome, the obedience of its hierarchy, the severity of intolerant laws, and the searching rigour of the Inquisition; the resolute adherence of great princes to the Catholic faith, the influence of the Jesuits over education: but these either existed before, or would at least not have been sufficient to withstand an overwhelming force of opinion. It must be acknowledged that there was a principle of vitality in that religion, independent of its external strength. By the side of its secular pomp, its relaxation of morality, there had always been an intense flame of zeal and devotion. Superstition it might be in the many, fanaticism in a few; but both of them imply

the qualities which, while they subsist, render a religion indestructible. That revival of an ardent zeal, through which the Franciscans had, in the thirteenth century, with some good, and much more evil effect, spread a popular enthusiasm over Europe, was once more displayed in counteraction of those new doctrines, that themselves had drawn their life from a similar development of moral emotion."

Of the religious intolerance of the Reformers, Mr. Hallam observes, a little further on:—

"As this is a literary, rather than an ecclesiastical history, we shall neither advert to the less learned sectaries, nor speak of controversies which had chiefly a local importance, such as those of the English Puritans with the Established Church. 'Hooker's Ecclesiastical Polity' will claim attention in a subsequent chapter. Thus, in the second period of the Reformation, those ominous symptoms which had appeared in its earlier stage—disunion, virulence, bigotry, intolerance, far from yielding to any benignant influence, grew more inveterate and incurable. Yet some there were, even in this century, who laid the foundations of a more charitable and rational indulgence to diversities of judgment, which the principle of the Reformation itself had in some measure sanctioned. It may be said that this tolerant spirit rose out of the ashes of Servetus. The right of civil magistrates to punish heresy with death had been already impugned by some Protestant theologians, as well as by Erasmus. Luther had declared against it; and though Zuingle, who had maintained the same principle as Luther, has been charged with having afterwards approved the drowning of some Anabaptists in the lake of Zurich, it does not appear that his language requires such an interpretation. The early Anabaptists, indeed, having been seditious and unmanageable to the greatest degree, it is not easy to shew that they were put to death simply on account of their religion. But the execution of Servetus, with circumstances of so much cruelty, and with no possible pretext but the error of his opinions, brought home to the minds of serious men the importance of considering, whether a mere persuasion of the truth of our doctrines can justify the infliction of capital punishment on those who dissent from them; and how far we can consistently reprobate the persecutions of the Church of Rome, while acting so closely after her example. But it was dangerous to withstand openly the rancour of the ecclesiastics domineering in the Protestant churches, or the usual bigotry of the multitude. Melancthon himself, tolerant by nature, and knowing enough of the spirit of persecution which disturbed his peace, was yet unfortunately led by timidity to express, in a letter to Beza, his approbation of the death of Servetus, though he admits that some saw it in a different light. Calvin, early in 1554, published a dissertation to vindicate the magistrates of Geneva, in their dealings with this heretic. But Sebastian Castalio, under the name of Martin Bellius, ventured to reply in a little tract, entitled, 'De Hereticis quomodo cum eis agendum sit variorum sententim.' This is a collection of different passages from the fathers and modern authors in favour of toleration, to which he prefixed a letter of his own to the Duke of Wirtemberg, more valuable than the rest of the work; and though written in the cautious style required by the times, containing the pith of those arguments which have ultimately triumphed in almost every part of Europe. The impossibility of forcing

belief, the obscurity and insignificance of many disputed questions, the sympathy which the fortitude of heretics produced, and other leading topics, are well touched in this very short tract; for the preface does not exceed twenty-eight pages in 16mo."

The following is a part of Mr. Hallam's criticism on the "Essays of Montaigne," one of the most remarkable books published in France during the sixteenth century; and one which had no small influence on the future character of French literature:—

"The 'Essays of Montaigne,' the first edition of which appeared at Bordeaux, in 1580, make, in several respects, an epoch in literature; less on account of their real importance, or the novel truths they contain, than of their influence upon the taste and the opinions of Europe. They are the first *procès-verbal ad populum*, the first appeal from the porch and the academy, to the haunts of busy and of idle men,—the first book that taught the unlearned reader to observe and reflect for himself on questions of moral philosophy. In an age when every topic of this nature was treated systematically and in a didactic form, he broke out without connexion of chapters, with all the digressions that levity and garrulous egotism could suggest, with a very delightful, but, at that time, most unusual rapidity of transition from seriousness to gaiety. It would be to anticipate much of what will demand attention in the ensuing century, were we to mention here the conspicuous writers who, more or less directly, and with more or less of close imitation, may be classed in the school of Montaigne: it embraces, in fact, a large proportion of French and English literature, and especially of that which has borrowed his title of 'Essays.' No prose writer of the sixteenth century has been so generally read, nor probably given so much delight. Whatever may be our estimate of Montaigne as a philosopher, a name which he was far from arrogating, there will be but one opinion of the felicity and brightness of his genius. It is a striking proof of these qualities, that we cannot help believing him to have struck out all his thoughts by a spontaneous effort of his mind, and to have fallen afterwards upon his quotations and examples by happy accident. I have little doubt but that the process was different; and that, either by dint of memory, though he absolutely disclaims the possessing a good one, or by the usual method of common-placing, he had made his reading instrumental to excite his own ingenious and fearless understanding."

"His quotations, though they perhaps make more than one half of his essays, seem parts of himself, and are like limbs of his own mind, which could not be separated without laceration. But over all is spread a charm of a fascinating simplicity, and an apparent abandonment of the whole man to the easy inspiration of genius, combined with a good nature, though rather too epicurean and destitute of moral energy, which, for that very reason, made him a favourite with men of similar dispositions, for whom courts, and camps, and country mansions, were the proper soil. Montaigne is superior to any of the ancients in liveliness, in that careless and rapid style, where one thought springs naturally, but not consecutively, from another, by analogical rather than deductive connexion; so that, while the reader seems to be following a train of arguments, he is imperceptibly hurried to a distance by some contingent association."

"He sometimes makes a show of coming back from his excursions; but he has generally

exhausted himself before he does so. This is what men love to practise (not advantageously for their severer studies) in their own thoughts; they love to follow the casual associations that lead them through pleasant labyrinths, as one riding along the high road is glad to deviate a little into the woods, though it may sometimes happen that he will lose his way, and find himself far remote from his inn. And such is the conversational style of lively and eloquent old men. We converse with Montaigne, or rather hear him talk; it is almost impossible to read his essays without thinking that he speaks to us; we see his cheerful brow, his sparkling eye, his negligent, but gentlemanly demeanour; we picture him in his arm-chair, with his few books round the room, and Plutarch on the table."

Of the character of the English philosophers of the reign of Elizabeth:—

"There was never a generation in England which, for worldly prudence and wise observation of mankind, stood higher than the subjects of Elizabeth. Rich in men of strong mind, that age had given them a discipline unknown to ourselves; the strictness of the Tudor government, the suspicious temper of the queen, the spirit not only of intolerance, but of inquisitiveness as to religious dissent, the uncertainties of the future, produced a caution rather foreign to the English character, accompanied by a closer attention to the workings of other men's minds, and their exterior signs. This, for similar reasons, had long distinguished the Italians; but it is chiefly displayed, perhaps, in their political writings. We find it, in a larger and more philosophical sense, near the end of Elizabeth's reign, when our literature made its first strong shoot, prompting the short condensed reflections of Burleigh and Raleigh, or saturating with moral observation the mighty soul of Shakespeare."

We have run over Mr. Hallam's second volume, until we have come to the pleasant and fertile head of poetry; and here, perhaps, we had better stop for the present; for, as we intend to continue our extracts from, and observations upon, this work in our next, the poets of the Elizabethan age will themselves afford more than sufficient matter for a review. For this reason, also, we shall withstand the strong temptation of quoting from Mr. Hallam's observations on the poets of Italy, Spain, Portugal, France, and Germany; though, perhaps, we may be allowed to make an exception in favour of a love-lorn lady:—

"The sorrows of Gaspara Stampar were of a different kind, but not less genuine than those of Roza. She was a lady of the Paduan territory, living near the small river Anasse, from which she adopted the poetical name of Anassilla. This stream besides the foot of certain lofty hills, from which a distinguished family, the Counts of Collalto, took their appellation. The representative of this house, himself a poet as well as a soldier—and, if we believe his fond admirer, endowed with every virtue except constancy—was loved by Gaspara with enthusiastic passion. Unhappily she learned only by sad experience the want of generosity too common to man, and sacrificing, not the honour, but the pride of her sex, by submissive affection; and finally, by querulous importunity, she estranged a heart never so susceptible as her own. Her sonnets, which seem arranged nearly in order, begin with the delirium of sanguine love: they are extravagant effusions of admiration, mingled with joy and hope; but soon the senses of Collalto's coldness glides in and overpowers her bliss. After three

years' expectation of seeing his promise of marriage fulfilled, and when he had already caused alarm by his indifference, she was compelled to endure the pangs of absence, by his entering the service of France. This does not seem to have been of long continuance; but his letters were unfrequent, and her complaints, always vented in a sonnet, become more frequent. He returned, and Anasilla exults with tenderness, yet still timid in the midst of her joy:—

'Oserò io, con queste fide braccia,
Cingerli il caro collo, ed accostare
La mia tremante alla sua viva faccia!'

But jealousy, not groundless, soon intruded, and we find her doubly miserable. Collalto became more harsh, avowed his indifference, forbade her to importune him with her complaints; and in a few months espoused another woman. It is said by the historians of Italian literature, that the broken heart of Gaspara sunk very soon under these accumulated sorrows into the grave. And such, no doubt, is what my readers expect, and (at least the gentler of them) wish to find. But inexorable truth, to whom I am the sworn vassal, compels me to say that the poems of the lady herself contain unequivocal proofs that she avenged herself better on Collalto,—by falling in love again. We find the acknowledgment of another incipient passion, which speedily comes to maturity; and, while declaring that her present flame is much stronger than the last, she dismisses her faithful lover with the handsome compliment, that it was her destiny always to fix her affections on a noble object. The name of her second choice does not appear in her poems; nor has any one hitherto, it would seem, made the very easy discovery of his existence. It is true that she died young, 'but not of love.'

Hamlet King; or, the Smuggler and the Dwarf. By the Old Sailor, author of "Tough Yarns," "Stories of Greenwich Hospital," &c. 3 vols. 12mo. London, 1839. Bentley.

In natural history we have the frigate-bird, Mother Cary's chicken, and others, which seem equally at home upon the tempestuous ocean, as if it were dry and solid land. So it is in literary history with some authors—Marryat, Chamier, Glascock, Cooper, and, though last, not least, the Old Sailor, who appear to be more at home on sea than on shore, and ride through storms like Mother Cary's chickens, and sail along like frigate-birds, untiring and moving with delight. In no former work have we seen this more powerfully exemplified than in the present. Mr. Barker sports and plays amid the waves, and his sailors do indeed seem "all as one as a piece of their ship." The men and the vessel are instinct with one life, and their mutual affection (for the craft acts as if it absolutely loved its accomplished navigator) is quite a picture of feeling and attachment.

And much of these three volumes passes on the sea, though our author has given us striking incidents from Irish Whiteboyism in a proclaimed district, and scenes from France, St. Domingo, the Spanish Main, the West Indies, South America, and England; through all which the stirring variety of his narrative, and the adventures which befall his principal characters, carry him and them. The action never pauses for an instant; and as for the plot, it is as mysterious, intricate, and startling, as the dearest lover of strange matters could desire. From a transport in a convict-ship we have a remarkable episode, intimately

connected, however, with the main story; and from American traders and Negro seamen, the humours and relief of the piece are cleverly deduced.

With the secrets of productions of this class our readers are aware we never meddle; and we should think it doubly wrong to do so where, as in this instance, the pleasure of unravelling them must be so great. We shall therefore, as usual, seek our illustrations in such extracts as we can most readily separate from the general text. And the Introduction offers itself in a peculiar manner for this purpose:—

"Oh! what shall I do?—where shall I go?—will nobody help me?" were the cries of a little girl about four years old, as she stood trembling and weeping at the entrance to a piece of meadow-land near the sea-port town of Weymouth. The only individual in sight was a stout-made elderly gentleman, mounted upon a superb gray horse, apparently as quiet and as playful as a lamb, for while it walked soberly and steadily along, it pricked up its ears, tossed its head, and indulged in many other little pleasantries that mark high breeding. The rider was habited in a dress that corresponded with the *beau idéal* of a clerical farmer, well to do in the world, and fond of the good things of this life. He listened to the wailings of the little mourner, and as he reined in his beautiful animal to a stand-still, he exclaimed, 'Fie, fie, little girl! so young, and begging!—there, go—go—go—go home; mustn't beg; never beg; bad habit, begging.' The girl gazed earnestly in his face for a moment or two to read its expression (for children are apt scholars in the study of the human countenance), and finding that, though reproof was on the tongue, there yet was benevolence in the look, she approached still nearer to the gentleman, and, in mournful accents, exclaimed, 'Oh, sir, mammy is dying! she is going to leave little Hammy and me; but she says she can't die without the minister.' 'What—what!' inquired the person addressed, in a tone of eagerness, 'is she dying, and wants the clergyman? Run—run, little girl; run to that white house!' pointing to an elegant mansion some quarter of a mile distant, 'run—run, the minister lives there.' 'I've been, sir,' replied the child, still crying, 'but he says he can't come, sir, because he's going to read prayers at the church.' 'Did you tell him your mother was dying; eh, little girl—eh?' inquired the gentleman. 'Oh, yes sir,' answered the child, 'I told him every thing; but he said he couldn't spare time for strolling vagrants.' 'And is she so near her end, my child?' asked the gentleman, as he bent his earnest attention to the girl's face, for the purpose of detecting, if possible, whether there was any intended imposition. But the grief of the child was evidently unaffected as she replied, 'Oh, sir; mammy says she shall never rise again. Oh, sir, she is dying—she is dying!' 'Make haste to the town, then,' urged the gentleman, 'run—run! or stop here, and I will ride in and send—' 'I've been to the town, sir,' answered the weeping girl, 'but nobody will come, and mother is dying! Oh, sir, do, pray help her, and do not let her die.' This was uttered in such wild accents of real sorrow, that a tear trembled in the eye of the horseman as he solemnly responded, as if in converse with his own thoughts, 'Life and death are in the hands of the King of kings alone;' and then hastily added, 'Well—well—well, little girl, where is she? where is your mother?' and then again, communing with himself, he murmured, 'And

am not I a minister? an anointed minister?' his hastiness of speech returned, 'Yes—yes; take me to your mother, little girl; take me to your mother. Where is she?' 'She's in the field here, sir; we've been there all night, for mother had no money to get lodgings,' replied the child, running with eagerness to open the gate, through which the gentleman having passed, she again ran on before him as fast as her little legs could carry her towards a hay-stack that stood near the hedge in a corner of the meadow. On reaching it she disappeared for a moment behind it, and then again emerging, she exclaimed, 'Mammy is not dead, sir, but she cannot speak to me! Oh, do save her, sir,—do save her, for the sake of little Hammy and me!' 'Poor child!' said the gentleman, dismounting from his horse, and throwing the reins over a broken fence that had once served as a protection to the stack from cattle, he patted the neck of his proud steed, which seemed restless under such restraint. 'Stand still, Gustavus!' said he, and the animal immediately obeyed. The girl eagerly watched his movements, and then, taking him by the hand, he suffered himself to be conducted to the back of the stack, where a scene presented itself that was well calculated to appal the generous sympathies of humanity, whilst it humbled the aspirations of mortal pride. On a wide space between the hedge and the stack, a female lay extended upon a plaid cloak, with her head pillowed by some loose hay that had been collected for the purpose. She was emaciated in person, and the pallid hue of death upon her brow was unnaturally contrasted by the reddened flush of fever on the cheeks; her skin was delicately fair, and a single glance revealed that in brighter, happier times, she had been one of Nature's most lovely flowers. Her large blue eyes were glistening and bright, but it was only that glassy appearance which is frequently the precursor of dissolution; the thin white hands were clasped upon the breast: the gold wedding-ring mocking, by its ample dimensions, the shrunk and wasted finger on which it was placed. Her dress was that of gentility in decay, as if the fading remnants of better days supplied a last and only resource. By her side lay a remarkably fine boy about two years old, who seemed by the traces of tears upon his face to have cried himself to sleep. To witness such a spectacle unmoved was impossible, and the visitor who now approached gave ample indication that he possessed the best feelings of the human heart. He bent down over the dying woman, and put several questions; but the melancholy satisfaction of reply was denied, as she was unable to articulate a single word. Still she was perfectly sensible, and, placing her hands together in the attitude of supplication, she looked imploringly in his face. The appeal was understood; the kind-hearted man drew an ample silk-handkerchief from his pocket, and, spreading it on the ground, he knelt down; then, taking off his hat, he placed it carefully on some clean hay, and, raising his hands in prayer, he bowed his head in silence. A wild hysterical chuckling of grateful delight rattled in the woman's throat as she witnessed this demonstration; she held up her own waxlike hands in token that it was comprehended. The girl knelt by her mother's head; and there, beneath the canopy of heaven, in the temple not made with hands,—whilst the wild flowers breathed their perfume in the hedges, and the foliage looked beautiful in its early verdure,—did the hearts of the living and the dying com-

mine with their Maker. At first, the humble petition was offered up in solemn stillness; but the earnest and imploring look of the woman had a wider meaning. This, too, was understood; and in a few minutes the sonorous and deep-toned voice of the minister was heard pleading before the Omnipotent Judge, from whose decision there is no appeal. His hastiness of utterance was gone; his words came forth clearly articulated—slow, solemn, and impressive. 'O God, the Father of heaven! whose mercy is without bound, from thy eternal thrones look down upon this my dying sister of the dust. Alleviate her bodily pain by the word of thy power; forgive all her sins through the mediation of a Divine Redeemer; strengthen her faith whilst passing through the dark valley of the shadow of death; and as thy righteous rod has bowed her down in tribulation, so also let thy holy staff support her in the hour of dissolution, and finally bring her to thine everlasting rest.' The minister paused; for the sound of merry voices and the clattering of horses' hoofs, as well as the neighing of recognition from 'Gustavus,' came upon the breeze; and, in another minute or two, a numerous and splendid cavalcade appeared upon the scene of action. Amongst them were many of the handsomest and bravest of England's pride, bearing the insignia of nobility; there were officers of the navy and the army in their rich uniforms, displaying the highest rank in both services; but every tongue was hushed—every one dismounted—every head was uncovered, when they beheld the position of the reverend minister. The woman glared at the gorgeous spectacle—it seemed to bewilder her mind; and, as if desirous of shutting out the world, with all its pomps and vanities, she closed her eyes as the prayer proceeded. 'Almighty Ruler,' continued the minister, 'thy searching eye already knoweth the transgressions and the sorrows of this thy suffering creature here before thee, now trembling upon the brink of the grave; help her to call upon thee in this last trying hour for pardon and for peace, through the merits of that Saviour who was chastised for our iniquities, and who expired on the cross that we might be saved.' A tranquil smile settled on the woman's features, and her moving lips gave indication that her heart was in earnest prayer. The minister observed it, and his utterance became more firm and persuasive; and as the big round tears succeeded each other down his cheeks, he continued—'Oh! let the still small voice of supplication, though unheard by mortal ears, ascend to the footstool of thy thrones. Remove the crown of thorns which the frailty of human nature may have placed upon her head, and pour upon her the healing balm of sovereign grace, to wash out every guilty stain.' Here his voice faltered with emotion, and for several minutes his entreaties were only known to that great Being to whom they were addressed. The woman, too, seemed to be similarly engaged, whilst every soul in that assembled group acknowledged the presence of the Deity. At length the minister resumed, and concluded his prayer, saying, 'O God, the Father of heaven, have mercy upon us miserable sinners, and so teach us to number our days that we may apply our hearts unto wisdom.' The female opened her eyes, and extended one hand to the oracle of peace; with the other she directed his attention to her children. 'Yes—yes,' replied he, 'they shall be taken care of, my poor woman; but can nothing be done?' He beckoned to one of the numerous party, who immediately advanced, and, as if well accustomed to such operations,

he felt the pulse, placed his hand upon the heart, examined the pupil of the eye, and then shook his head. 'Is there no hope, doctor?' inquired the still kneeling minister. 'No, sire,' returned the physician—'none. All in your majesty's dominions could not save her.' The question and rejoinder, though spoke only in whispers, was not unheard by the female; it seemed to rally life back to its stronghold. She involuntarily, and without help, sat upright; a gaze of intense eagerness was bent upon the monarch's countenance; the last effort of expiring nature was put forth, and, grasping the sovereign's arm, she exclaimed, 'My king—my husband—my children!' Her latest breath departed with the words; her grasp relaxed, and she fell backward—a corpse. During the foregoing proceeding the girl remained a silent but weeping spectator; but when she saw her mother fall, and became convinced that she was dead, she threw her little arms round her neck, laid her head upon the bosom on which she had so often hung in infancy, whilst her piercing shrieks rung wildly through the air, and awakened the sleeping boy, who rubbed his drowsy eyes, smiled playfully as he beheld the prancing horses and the glittering uniforms—then turning to the dead he hid his face in the cloak. The king arose from his kneeling position, gave directions to his attendants relative to the body of the departed, and ordered inquiries to be instituted for the purpose of ascertaining whether there were any relatives or friends in existence to whose bounty and care the survivors might lay claim. 'And what is to be done with the children in the meantime, sire?' asked the confidential servant who had received the instructions. 'Let them be taken care of, and provided for,' replied the monarch, looking with kindly feelings of benevolence on the bereaved; 'the queen will provide the rest. Yes—yes—yes, must shew the poor things to Charlotte.' The royal cavalcade remounted, and withdrew from a scene in which the King of Terrors had shewn his sovereignty before the greatest monarch in the universe, and princes had received an important moral lesson on the instability of human life. And what is death?—a fearful mystery that is ever before us! Youth, manhood, beauty,—all that is brave and honourable, all that is great and good, fall before the tyrant; and those who have loved and cherished the living turn with dread and disgust from the corpse, thrusting it hastily from their sight as a loathsome thing. There is a chilling horror in listening to the groaning of the screws as they confine the coffin-lid over features that are well remembered in the heart, and over motionless hands that once were pressed with the ardency of warm affection. And what is life?—the soldier and sailor traffic in it at a few pence a-day!—In about an hour a hearse arrived at the spot in which the body was deposited, and the children followed in a close carriage which had been sent for the purpose by the worthy physician, the girl weeping as if her heart would break; the boy, unconscious of his loss, delighted with the novelty of his situation as the melancholy procession passed through the assembled crowds, who had gleaned some circumstances connected with the occurrence from persons in his majesty's suite, and had thronged together through curiosity to witness the spectacle, as well as to express their admiration of the paternal solicitude of their royal master. Admirable are those inquiries in England which so promptly investigate the causes of sudden death; and though it must be admitted that in numerous instances the pre-

siding officers were extremely illiterate men, yet they generally possessed plain common sense and sterling honesty. A coroner's jury was summoned;—the supremacy of the law was established by the sovereign making his deposition;—the children were questioned, but nothing could be elicited except from the girl, who stated that she had lived in a pretty cottage with her parents, had been turned out from it, and her father taken away,—she had crossed a wide pond of water with her mother,—had travelled on foot many days till they reached a great town, and went to the king's house, but finding he was not there, they had again set out; her mother had sickened on the road the evening previously to her dissolution; destitute of money to procure lodging or food, she had laid her on her death-bed,—the child had gathered hay for her pillow,—the night was passed beneath the canopy of heaven, and the last consolations of religion had been administered by the royal defender of the faith."

The narrative turns to Ireland, and the parties who afterwards figure in the tale take their stations. Among them Feaghan the smuggler, and Cornelius the dwarf, are prominent, and powerfully drawn. As we advance from their daring and desperate exploits, the tragic interest increases, and deeds of darkness are done, the issue of which is wrapt in fearful anticipations. Captain Lillyburn, of a revenue cutter, is here a very original and amusing portrait; but we abstain from particulars as indeed we must reluctantly also from the admirable sea-painting, with which the work abounds. But we must cull a morsel from St. Domingo, and Quaco, a glorious, ignorant, and most acute nigger:—

"The youngster had an entire establishment to himself: a groom, a head-nurse, servants of both sexes; and it was no uncommon thing to hear a drawling negro voice exclaim—'Jean, go and peka Saam to tell Jacques to call Quaco to the young massa!—hearse?' To perform this, Jean would probably pass Jacques or Quaco in seeking for Sam, but it would have been entirely out of negro routine to intimate one word to them, except through the proper messenger, as desired; and thus, Quaco, who might have been summoned instantly, was usually half an hour before he made his appearance, with a—'Wharra him young massa want?' Quaco was an old negro, who had not only visited several of the other West-India islands, but his early days had been passed as a slave amongst the English in Jamaica; he had also been some time in England, with his former master, where he might have remained a free man; but returning to the island, he was again a slave, though his owner placed so much confidence in him that he made him captain of one of his sloop-built droghers, which gave him an opportunity of seeing much of the other islands. Unfortunately, his vessel had been wrecked off Cape Tiburon, and he alone escaped to the shore, where he was seized as a runaway slave, kept some time in confinement, and then sold to a Spanish planter to pay the expenses. In the course of time he was purchased by the late proprietor of Solitaire, and ultimately became house-steward at the residence. Now though Quaco could speak—that is, could mutilate—both Spanish and French, he had chosen, when any thing displeased him, to grumble and to swear in English. Whether there was any thing of an affirmative character between English and grumbling, or whether the full-mouthed utterance of a hearty 'd—' gave greater relief to the stomach than a mere 'sacré!'

it is hardly necessary here to discuss: Quaco invariably used the French language in his ordinary duties—sported the Spanish when he wanted to be a grandee, and rapped out unmercifully in English when a disposition prevailed to become a downright blackguard—the more especially as he could have it all his own way: for as no one understood him, so no one could answer him in his angry moods, and the fit of passion was the sooner over. It happened, shortly after the landing of Madame Briquet, that Quaco was summoned to her presence, and reprimanded for a neglect of duty on the part of some of the younger slaves. 'Madame,' returned he, with an obsequious bow, 'la faute n'est pas mienne;' and then muttered to himself, 'Em d— blaack nigger.' Hamilton caught the broken words, for he was standing close to him, but said nothing. 'Well, Quaco,' uttered his mistress, 'I shall look to you for the management of these things, and hope there will be no occasion to complain again.' The negro bowed most politely as he uttered, 'Au plaisir, madame,' but there was a grimace of look about his visage that plainly evinced he was far from pleased. He then retired from the room, followed by Hamilton, who overheard him muttering to himself, 'Em daam cow-cumber-shin rascal!—Mon Dieu! but dey get jolly fum fum for dis!' He then shouted, 'Monsieur Jacques! ayez la bonté de venir ici, s'il vous plaît!' adding in a lower key, 'Yer daam delibbi babby for makes me missee tink me no sabby ebery ting for you!' Again he shouted, 'Monsieur Saam! dépêchez-vous donc—un brave garçon, sans doute!' Once more his voice fell—'Cus you black libber for all day long!' 'Monsieur!' exclaimed Jacques, cautiously looking in at the doorway to ascertain the mood of the old man, before he ventured to approach within assailable distance—'Que dites-vous, monsieur?' 'Que dites-vous, monsieur?' repeated Quaco spitefully, well knowing, from former experience, that Jacques was too wary to be caught: 'Que dites-vous?' he reiterated, whilst he advanced upon the young negro as he retreated backwards: 'Arrêtez-vous là;—yer daam monkey-face, lib-in-a-bush, white-libber nigger's nigger!' This was quite enough for Jacques; he was well aware that the storm was rising, and, therefore, to use a nautical phrase, he made a grand 'stern board' towards the flight of steps that led from the verandah to the garden below. At this point Quaco made a sudden spring to catch the youth, previously to his descent, and actually achieved his object at the very moment that Sam had attained the summit in his ascent; the consequence was, that Jacques, impelled by the additional stimulus of Quaco, stumbled over Sam, and all three went rolling head over heels to the bottom, roaring and hallooing with all their might. The altitude, however, was not very great, so that no injury, beyond a thorough shaking, was sustained by the fall. But Quaco had now got both culprits in his clutches, and though he could not let go one to thump the other, yet he knocked their heads together with all his force, exclaiming, 'Darra for you!—yer daam bajain-born, crabb-for-n'yam, suck-'em-goat niggers—eh? Yer nebbber mind n'oder time, Monsieur Jacques—no? D'un autre côté, Monsieur Saam. Mettre quelque chose dans votre tête, mon ami!—Cus you rogue-heart, for nebbber do what genelman tell you!—faire des singeries, eh? Darra den, ye haang-gallows, plantain-tieving sopy-drinking coquin—me one daam rascal for you?' All the time Quaco was very foolishly knocking their pates against each other, with very little effect; for

as a negro's head is the least vulnerable part of his body, the punishment was scarcely felt, and the moment they escaped from his clutches, they testified their sense of it, by changing their loud yells to uncontrollable laughter, as Quaco reascended the steps, down which he had gone so much against his inclination."

With this we would conclude, but where the good king's name-son is the hero, we may as well give a bit of Quaco's version of the national anthem:—

"'God shabe em Jarge de king,
Laang lib him nobber king,
God shabe de king;
Sen him wiggytoryus,
Naappy an gollous,
Laang to run ober us;
God shabe de king.'"

The third volume heaps up the intricacies; but in the end the *dénouement* comes; and satisfied readers will lay down one of the best naval and romantic stories of our day.

The Works of the Rev. Sydney Smith. 3 vols. 8vo. London, 1839. Longman and Co.

No man ever wielded the weapons of sarcasm and ridicule with greater talent and effect than the reverend author whose works are here collected together. Wit and humour are his elements, and he sports amid the waves he lashes up, like a porpoise playing in the sea. Never were there such gambols,—spouting, rolling, tumbling, leaping,—and then darting away with incredible swiftness to the object in view; which, being seized, the capricious are again indulged in, as if no other purpose had ever been entertained than that of rollicking among the yeasty waves.

The first two volumes are filled with Articles contributed to the "Edinburgh Review;" upon his connexion with which the writer looks back with great complacency, as will be seen by his preface, which we quote entire, previous to offering any remarks upon it, or the matters to which it refers:—

"When first I went into the Church," says the reverend gentleman, "I had a curacy in the middle of Salisbury Plain. The squire of the parish took a fancy to me, and requested me to go with his son to reside at the University of Weimar; before we could get there, Germany became the seat of war, and in stress of politics we put into Edinburgh, where I remained five years. The principles of the French Revolution were then fully afloat, and it is impossible to conceive a more violent and agitated state of society. Among the first persons with whom I became acquainted were, Lord Jeffrey, Lord Murray (late lord advocate of Scotland), and Lord Brougham; all of them maintaining opinions upon political subjects a little too liberal for the dynasty of Dundas, then exercising supreme power over the northern division of the island. One day we happened to meet in the eighth or ninth story or flat in Buccleuch Place, the elevated residence of the then Mr. Jeffrey. I proposed that we should set up a review; this was acceded to with acclamation. I was appointed editor, and remained long enough in Edinburgh to edit the first number of the 'Edinburgh Review.' The motto I proposed for the 'Review' was,

'Tenul musam meditatur avena.'
'We cultivate literature upon a little oatmeal.'

But this was too near the truth to be admitted, and so we took our present grave motto from 'Publius Syrus,' of whom none of us had, I am sure, ever read a single line; and so began what has since turned out to be a very important and able journal. When I left Edin-

burgh, it fell into the stronger hands of Lord Jeffrey and Lord Brougham, and reached the highest point of popularity and success. I contributed from England many articles, which I have been foolish enough to collect and publish with some other tracts written by me. To appreciate the value of the 'Edinburgh Review,' the state of England at the period when that journal began should be had in remembrance. The Catholics were not emancipated—the Corporation and Test Acts were unrepealed—the game-laws were horribly oppressive—steel-traps and spring-guns were set all over the country—prisoners tried for their lives could have no counsel—Lord Eldon and the Court of Chancery pressed heavily upon mankind—libel was punished by the most cruel and vindictive imprisonments—the principles of political economy were little understood—the law of debt and of conspiracy were upon the worst possible footing—the enormous wickedness of the slave-trade was tolerated—a thousand evils were in existence, which the talents of good and able men have since lessened or removed; and these effects have been not a little assisted by the honest boldness of the 'Edinburgh Review.' I see very little in my reviews to alter or repent of: I always endeavoured to fight against evil, and what I thought evil then, I think evil now. I am heartily glad that all our disqualifying laws for religious opinions are abolished, and I see nothing in such measures but unmixed good and real increase of strength to our establishment. The idea of danger from the extension of the Catholic religion in England I utterly deride. The Catholic faith is a misfortune to the world, but those whose faith it conscientiously is, are quite right in professing it boldly, and promoting it by all means which the law allows. A physician does not say, 'You will be well as soon as the bile is got rid of;' but he says, 'You will not be well until after the bile is got rid of.' He knows after the cause of the malady is removed, that morbid habits are to be changed, weakness to be supported, organs to be called back to their proper exercise, subordinate maladies to be watched, secondary and vicarious symptoms to be studied. The physician is a wise man—but the anserous politician insists, after 200 years of persecution, and ten of emancipation, that Catholic Ireland should be as quiet as Edmonston or Tooting. Not only are just laws wanted for Catholic Ireland, but the just administration of just laws; such as they have in general experienced under the Whig government; and this system steadily persevered in will, after a lapse of time and O'Connell, quiet, conciliate, and civilise that long-injured and irritable people. I have printed in this collection the 'Letters of Peter Plymley.' The government of that day took great pains to find out the author; all that they could find was, that they were brought to Mr. Budd, the publisher, by the Earl of Lauderdale. Somehow or another, it came to be conjectured that I was that author: I have always denied it; but finding that I deny it in vain, I have thought it might be as well to include the Letters in this collection: they had an immense circulation at the time, and I think above 20,000 copies were sold. From the beginning of the century (about which time the 'Review' began) to the death of Lord Liverpool, was an awful period for those who had the misfortune to entertain liberal opinions, and who were too honest to sell them for the ermine of the judge, or the lawn of the prelate:—a long and hopeless career in your profession, the chuckling grin of noodles, the

sarcastic leer of the genuine political rogue—prebendaries, deans, and bishops, made over your head—reverend renegades advanced to the highest dignities of the Church, for helping to rivet the fetters of Catholic and Protestant Dissenters, and no more chance of a Whig administration than of a thaw in Zembla—these were the penalties exacted for liberality of opinion at that period; and not only was there no pay, but there were many stripes. It is always considered as a piece of impertinence in England, if a man of less than two or three thousand a-year has any opinions as all upon important subjects; and, in addition, he was sure at that time to be assailed with all the Billingsgate of the French Revolution—Jacobin, Leveller, Atheist, Deist, Socinian, Incendiary, Regicide, were the gentlest appellations used; and the man who breathed a syllable against the senseless bigotry of the two Georges, or hinted at the abominable tyranny and persecution exercised upon Catholic Ireland, was shunned as unfit for the relations of social life. Not a murmur against any abuse was permitted; to say a word against the eulcoric delays of the Court of Chancery, or the cruel punishments of the game-laws, or against any abuse which a rich man inflicted, or a poor man suffered, was treason against the *Plouiscocracy*, and was bitterly and steadily resented. Lord Grey had not then taken off the bearing-rein from the English people, as Sir Francis Head has now done from horses. To set on foot such a Journal in such times, to contribute towards it for many years, to bear patiently the reproach and poverty which it caused, and to look back and see that I have nothing to retract, and no intemperance and violence to reproach myself with, is a career of life which I must think to be extremely fortunate. Strange and ludicrous are the changes in human affairs. The Tories are now on the treadmill, and the well-paid Whigs are riding in chariots; with many faces, however, looking out of the windows (including that of our prime minister), which I never remember to have seen in the days of the poverty and depression of Whiggism. Liberalism is now a lucrative business. Whoever has any institution to destroy, may consider himself as a commissioner, and his fortune as made; and to my utter and never-ending astonishment, I, an old Edinburgh Reviewer, find myself fighting, in the year 1839, against the Archbishop of Canterbury and the Bishop of London, for the existence of the National Church."

It must be a most gratifying feeling to a person who has influenced the public mind by his writings on many subjects of national interest, to be able to cast a retrospect over his labours, and believe that he has successfully contributed his full share of exertion to the promotion of human happiness. On the whole, we think it impossible that Mr. Smith should not be blessed with this consciousness; for, without speaking of the debateable questions in which he has been a zealous partisan, there are some of general benevolence and justice upon which he has exercised his great abilities with singular efficacy. Such are the subjects of public schools, chimney-sweepers, prisons, counsel for prisoners, &c., on which his reasoning powers have been employed, till the evils attendant upon them have been abated or removed. In other reviews, personal attacks and party politics are not so readily reconcilable to common approbation; but the man who penned them, holding certain opinions which he still continues to hold, will find no weight

upon his conscience in looking back even upon these less agreeable productions. Their nature, and their author's reflections on them, may be gathered from the preface we have just quoted. He religiously rejoices in Catholic Emancipation, and the repeal of the Test Act; he is proud of his share in instigating the alterations in the game-laws; the abolition of the slave-trade; the reforms in the laws of debt and of libel; in prison discipline; in the trial of prisoners; and "a thousand evils" which were in existence when he couched his pen against them.

Perhaps he vaunts a little too much. We are not sure that the Court of Chancery has been so wonderfully improved since Lord Eldon's days; we are not sure that the principles of political economy are much better understood now than they were in the days of Adam Smith; we are not sure that the horrors of the slave-trade and slavery have not been augmented by our humane interference; we are not sure that Ireland is in a happier or more prosperous and secure condition now than when she was the theme of Mr. Smith's lucubrations. The great change seems to be that another political side has turned uppermost; and that, as if born to be in opposition, our spirited divine castigates Liberalism with the same unsparing rod he formerly applied to Toryism. Under these circumstances, and claiming merit for what he has achieved against abuses, it is somewhat contradictory to hear him exclaim, that "not a murmur against any abuse was permitted!" If so, how came he to be heard, to be tolerated, and to prevail. His ears were never nailed to the pillory, nor was one of his fellow-reviewers persecuted, or retarded in their career. Their talents seem, on the contrary, to have fortunately prospered; and lord-chancellors, judges, commissioners, &c. &c., were made out of the set who began by cultivating literature upon a little oatmeal.

Our author himself, though his head has not been fitted to a mitre, whilst many inferior persons have reached that distinction, cannot be called one of the unlucky children of the church. His preferences are, we believe, tolerably snug. Had he written nothing but the essay upon the ballot (now in an eighth edition as a threepenny pamphlet), he would, in our opinion, have deserved a higher national reward than the wealthiest bishopric in the land, which he thus unanswerably tried to save from a universal prostitution of honesty, honour, and morality.

But we are getting out of our depths, and shall only add that the third volume contains that pamphlet; the three admirable Letters to Archdeacon Singleton; Letter on the Character of Sir James Mackintosh; Letter to Lord John Russell; Sermon on the Duties of the Queen, and three other sermons; Letter on the Catholic Question; and, above all, the cream of his writings, the famous "Peter Plymley's Letters."

Adventures of an Attorney in Search of Practice. 12mo. pp. 407. London, 1839. Saunders and Otley.

From the title of this volume we anticipated a satirical history of those preying harpies, whose adventures, in search of practice, are a disgrace to their profession, and a grievous injury to the honest and industrious classes of society. For a country to be priest-ridden is bad, but to be lawyer-ridden is infinitely worse. The former may take a tenth or a twentieth, but the latter gripes the whole; not the tithe-pig alone, but the entire litter, and the mother that bore them, bristles and

all. Look for an illustration of our criminal code at the recent case of the gold-dust robbery: the legal robbery, in bringing the thieves to justice (that is, if they do not yet escape upon some quibble of practice), amounted to as much or more than the first loss. For our politico-legality take a peep at the Carlow election petition; a sifting of more than sixty days, and an expense of above 20,000*l.*!! But why instance particular cases?—there is not a day, nor an hour, nor a minute that passes, notwithstanding the late amelioration in the ministering of the laws, that is not publicly marked by the heavy oppression which enthralls, and grinds down, almost every individual and every order of the community: and this is as a feather when compared with the private wrongs and extortions which so universally cripple and plunder the utility and exertions of the people of England. An attorney's letter is more alarming to the active and busy man than the report of a highwayman's pistol; and, indeed, the danger is much greater from the one than from the other. A single shot, and one rifling, may do little mischief; but from the grasp of what is called legal "justice," there is no escape: the wig must follow the hat, and the skin of the victim his coat and shirt.

The work before us presents, on the other side, the view of an Attorney, who pursues direct, and not callous courses. One of the rare birds belonging to the menagerie—a kite without claws, a raven without greediness, a vulture with the breast of a pigeon. That there are such honourable exceptions to the too common rule, we can testify from personal knowledge; but we have also observed too much of the world, and of what is going on around us, not to be equally certain that the greatest curse of the country, in every branch of exertion and laudable pursuits, lies like a pestilence upon it, from the iniquitous and unchecked villany of the lower million of base practitioners. Without strife, they could not live; without rascality, there would be no existence on earth for them. They are the heartless and unproductive consumers of the fruits of others' toil; and wherever misfortune has impeded the hopes of honourable efforts their harvest is found, and they reap it to the last grain of human effort and suffering. The good, and the truly respectable, to whom we have alluded, have one grievous sin to answer for—that they do not combine to cleanse their temple of this pollution, and extirpate from their body the vagabonds whom they know to be guilty of every act of unauthorised swindling and partially authorised extortion. They ought to do so for their own sake; and they could not, by any other means, do so essential a service to the kingdom at large.

Our author illustrates his various positions by anecdotes of clients and causes, some of which are amusing, and all, we think, of a character to be read with advantage, and especially by lawyers; including all who, in popular parlance, go by that appellation. We will now make our selection. In a government action he relates:—

"I was summoned to the Foreign Office. At the end of a long apartment, busily occupied in papers from which he seemed unwilling to take his eye, sat a young man scarcely older than myself, and dressed in the extreme of fashion, with whiskers and moustaches of no common dimensions; they were at that period much less common than at present; his hands were decorated with gilt spurs of extraordinary length; his trousers braided on the sides, and in fact his whole costume partook of the

style of military undress. It was not Lord Lyndhurst, then Sir John Copley, though the very next day I recollect meeting this learned solicitor-general, in consultation with his yet more learned colleague, in precisely the same equipment. It was not till long after that I found out the title of my dandy instructor; on this occasion I knew not whether he was lord or commoner, patrician or plebeian, beyond what the locality argued. I had been standing some five minutes or more when he first looked up, eyeing me with a stare compounded of hauteur, scrutiny, and surprise. I thought to myself even then, and very frequently on similar occasions since, how vastly ignorant these great folks are of every thing and every body beyond the circle of their own little world! or it would never enter into their imaginations to conceive that even the most juvenile attorney on the roll would be abashed for a single moment by a supercilious official stare: we should indeed have laboured in vain at judges' chambers, and the master's office, if such petty courtesies of life did not at once secure our self-possession. I never meet with a rude man, especially one who is condescendingly rude, but I immediately vote him vulgar; and vulgar men are below the level of gentility, let their birth or station be what it may, and therefore below mine! By this little syllogism, I can always recall my self-complacency, whatever may be the offence."

This is a good picture of official insolence, and we could be well pleased to believe that the offensive race was extinct; but while, &c. &c. &c. live! But, to return to our author, he observes:—

"One axiom on the question of costs is so obviously true, that we cannot avoid surprise at our clients so often losing sight of it. If they wish only to pay their attorney like a shoe-black, they will soon have only shoe-blacks for their attorneys. No man can limit himself as to the extent of costs, without cramping his exertions to a degree that may prove highly injurious to his client's interests. The casualties and accidents of litigation are so frequent, and sometimes so expensive, that they occasion more expenditure than even the whole of the proceedings that go on in the accustomed course; and if the cause of action is not of sufficient importance to warrant costs out of the ordinary routine, if necessary, it is wiser and more honest to advise the client to submit to his loss. This maxim must be received *cum grano*, certainly; but in cases where character is not involved, or rights ultra the subject-matter of the litigation, it is invariably true. In ordinary actions to recover debts, or damages for pecuniary injury, the expense resolves itself into mere matter of arithmetical calculation; such actions, however, form by no means the staple commodity in the business of an eminent attorney.

"The casualties of litigation are so numerous and diversified, that it is utterly impossible, unless in the simplest matter, to foretell the expenses. The recent reforms in pleading, by compelling a disclosure of the real defence, have reduced, but not superseded the speculative guesses of the attorney: indeed, in one respect, they have added to the difficulty; because, by success on one issue, and failure on another, a debtor and creditor account of costs is established, the balance of which may, by possibility, be against a plaintiff, though he has been successful on the general merits. It is a very pleasant thing, no doubt, to have to tell your client, 'Oh yes, sir! we have succeeded for you; but instead of receiving costs,

you will have forty or fifty pounds to pay to your opponent.' Independently of this, a hundred accidents may occur, all tending to multiply costs. A witness may be ill, and the record must be withdrawn; a bill for discovery may be advised; an injunction may be obtained by the defendant; a cross-action may be brought; indispensable witnesses may have made a trip to Naples or New York, and must be examined on interrogatories: in a word, so many deviations may, and generally do, occur, that no prudent solicitor will ever insure his client against the amount of costs, unless in the most general, and therefore the most unsatisfactory way. The right answer is, 'If costs are an object, settle your quarrel out of court, as best you may;' and to clients themselves, I may observe, that if an attorney is disposed to be dishonest, no skill can avail them against overcharges; for his charges may be individually reasonable, and even low, but so needlessly frequent, as to make the sum total of his bill nothing less than fraudulent, though none but a brother-attorney can detect the fraud. It is often the case with mean and illiberal clients, that they submit their attorney's bill to another practitioner, unknown to him. Every solicitor should be prepared for this; for I have known too many instances, where, to carry favour with a new acquaintance, or to acquire on easy terms a credit for moderation, an attorney has pronounced severe and mischievous judgment on the costs of his respectable neighbour, though all in the profession would rightly consign the critic himself to the shades of Newgate as an incorrigible thief."

Of the inferior, but not the lowest of the pettifogging tribe, the author says:—

"I am ashamed to say of my brethren, that I know too many among them, the style of whose composition would disgrace a chamber-maid, and the tone of whose manners would exclude them from the butler's pantry. I know not one, however, of this description who has ever attained, or even aspired to a higher rank in it, than that which might be allowed to a sheriff's officer, or a money-lending Jew. Honesty, in the ordinary and limited sense of the term, is generally presumed as a qualification of course, though ill-natured people do say that it is rather an extraordinary professional trait. All, however, are agreed that, to a greater or less extent, according to taste and the character of his business, law, general knowledge, and common honesty, are required in an attorney: but discuss the desirable a little further, and we find the usual definition given of the desiderated animal is that he shall be 'a sharp, clever fellow.' In deference to this favourite notion, I have assumed my *nom de voyage*; yet with the inconsistency of many who travel the Continent as captains and colonels (I know one gallant old gentleman at this moment, who designates himself abroad as 'Monsieur le Colonel,' in virtue of an old uniform to which he had acquired a title under the volunteer system), I am bold enough to say not only that your 'sharp, clever fellows' make your worst attorneys, but that they rarely gain admission to the higher classes of respectable clients: this sounds a little paradoxical, but there is sufficient reason for it. The sort of cleverness which obtains this reputation for an attorney, is to be found in every office on very cheap terms. Every common law or chancery clerk (as a piano that has been practised on for two or three years, arrives at its prime) is after a short probation, pre-eminent for it: and no office of any extent in business is without a

convenient appendage of this kind, whose special duty it is to set snares and catch an opponent tripping: whenever he or his employer is at fault, the pleader or a junior counsel will soon make a skilful cast for the scent. This conflict of wit for petty advantage often occurs among the subordinates of an attorney's office; and where (though that is very seldom) the client reaps any real benefit from it, the principal, by reflected honour from his clerk, is voted a 'sharp and clever fellow.' Among respectable men, however, these paltry contentions are despised, and also discouraged; because they tend to create angry and vindictive feeling, without any counter-balancing advantage, except, perchance, two or three pounds that may be successfully extracted from the pocket of an opponent in the shape of costs, with as much credit, though more safety, than by picking it of a watch and seals. It generally happens that clerks who spend their novitiate in learning this cleverness, pique themselves so much on the acquisition of it, that they learn but little else: and when they enter upon practice on their own account, have no other accomplishment to bring to their aid. Hence their minds degenerate; their business is low, because it is chiefly in low business that such smartness enables them to shine; and even low and vulgar clients very soon discover, that while in the progress of a cause, these 'sharp, clever fellows,' are daily met and defeated by pleaders and counsel, if not by attorneys, as sharp and clever as themselves, their sharpness is frequently turned upon their employers, of whose dullness they can render very profitable account! The truth is, that it is only clients of very doubtful honesty, and who have business to transact which demands the protection of those resources to which knavery alone will stoop, that require the aid of these 'sharp, clever men;' but such clients are not worth having on any terms, and if you have too many of them, you will secure a reputation for cunning and address that will keep more respectable connexions at a respectful distance. If I were asked to define the professional character to which I should most willingly trust myself, in an affair of delicacy or importance, involved in intricate details of circumstance, and entangled, perhaps, with much of personal and private feeling, I should select a man distinguished by calm energy, a clear head, and sound common sense: if in addition to this, he were gifted with a cheerful disposition, and marked, not by fastidious delicacy of mind, but by that enlarged honesty which is usually intended by 'honourable principle,' I should consider that he possessed the finest qualities for a useful attorney. Of course there are not many who come up to this standard; but in proportion as they approach it, and as the general nature of their business implies that they keep it constantly in view, a client may consider himself safe in their hands.

"I only wish to explain how it happens, that in a profession which is now justly esteemed a liberal one, and in which we daily meet with men well qualified to adorn any rank of life, we should yet more frequently fall in with others whose manners would exclude them from our servants' hall, and whose characters would compel us to count our spoons, if by any accident they gained admission there. It is but too true that we have among us a large body of adventurers, who have little education, less principle, and neither capital nor connexion. It is probable that, in some instances, their friends have selected them

for attorneys, because they have exhibited a predilection for that speculative inquiry into the rights of property which, by a more summary process, leads those who have no relatives to the gallows. There are various ways by which these adventurers contrive to work out a livelihood in a 'respectable' manner. The secret of their art is to establish a familiar acquaintance with any humble class, where the ceremony of special introduction is of small account, and, in the words of the play, to 'push it as far it will go.' There are many classes of this description daily to be found in our crowded metropolis; and all of them, either from their helpless ignorance, or dishonest pursuits, stand in daily need of 'a professional adviser.' Among the helpless, may be enumerated the thoughtless sailor just returned from sea—the inferior tradesman trembling on the verge of bankruptcy—the pigeon who, after plucking, hesitates between reform and desperation—the ruined spendthrift, but expectant heir—and yet more frequently the beggared gentleman, that prefers enjoying his last hundred within the prison walls to dividing it among fifty creditors at the rate of sixpence in the pound. The dishonest class is, perhaps, less accessible, but far more profitable: it consists of cent-per-cent money-lenders and annuity-mongers; of brokers who will discount a six months' bill on the security of a watch or a well-secured post-obit; hell-proprietors and blacklegs of Regent Street and St. James'; swindlers of the turf; smugglers by profession; 'fences' of the lanes and alleys of the town, including of course nine-tenths of the pawn-brokers and dealers in marine stores; and finally, all the thieves and pickpockets in the bills of mortality.

"There is still another class of legal adventurers who are a scale higher in the estimation of the world, but with very little higher merit; they are men who prowl about for bad debts and dishonoured bills: they call on tradesmen of the better order at Midsummer or Christmas, as punctually as the tax-gatherers, and inquire the extent of bad and doubtful debts in their ledger: they buy them up according to circumstances, and obtain a rich harvest, if they can purchase five or six hundred pounds due from a score of customers, at five shillings in the pound; twenty actions are thus secured, and as many writs issued on returning to office; in half they recover nothing but the costs; if in the remaining ten they can manage to average ten shillings in the pound, they are indemnified for the purchase-money, and pocket the costs of twenty actions by the adventure, besides the frequent chance of being incidentally introduced to some half-ruined man, who wants an attorney's aid to get white-washed by bankruptcy, or the insolvent court. Thus I have explained the character of those whom I exclude from the 'respectable' class of my profession, whatever others may call them; and these are the attorneys of whom I always feel a painful anxiety to get quit as soon as decency will allow; but some address is required to manage one's intercourse with them, when driven by necessity into communication. There is one peculiarity of disposition inseparable from such fellows. They invariably try to snap some advantage at your personal cost, and if they fail, they uniformly pick a quarrel about nothing: so certainly is it the case, that, in common with all my liberal brethren, I am accustomed to infer the quality of a man's clients by the 'sharpness' of his practice, as it is termed; and I set him down for an Old Bailey attorney as a matter of course, if I find

him grasping at undue advantage, or losing his temper in the attempt: a coarse, bullying manner, and disingenuous disposition, may be fairly assumed to indicate the accustomed associate of thieves and blacklegs; they always do with me, and it is one of the few points on which I have never found myself mistaken."

There are some curious disclosures of domestic disputes and family arrangements (and one extremely interesting tale of a gambler's decoy wife); but we must sum up, and, instead of our own words, give one remark of the author which is worthy of notice:—

"Of all witnesses in an honest cause, an intelligent child is the best. Of all witnesses, in any cause, a woman is the worst, unless she happens to be very pretty and engaging; and then she will answer the purpose, whatever it be, most successfully."

A Greek Lexicon to the New Testament, on the Basis of Dr. Robinson's; designed for Junior Students in Divinity, and the Higher Classes in Schools. By Charles Robson, Τονογράφος. London, 1839. Whittaker and Co.

"ANOTHER Greek Lexicon to the New Testament!" we mentally exclaimed, as we read the title-page of this beautiful, well-crammed volume. "Why, we have within a few months had no fewer than three editions of this same work of Dr. Robinson's: it is a very good book; but surely there cannot be such a demand for it, or we shall indeed be a learned public, and outstrip even Germany itself—that land of philological prodigies." Thus we mused; but, on turning to the book in our hand, we found (as sometimes happens even with Us) that we were getting on too fast, the two works being intended for totally distinct classes of students. In the Preface it is stated that Dr. Robinson's "work is suited rather to the advanced scholar than to the young divinity-student, or to the youth in the higher classes of our public schools; for whose use," says Mr. Robson, "no adequate Lexicon to the New Testament has hitherto been provided,—a want which the present book is intended to supply. It appeared to the editor (he continues), that taking Dr. Robinson's work as his basis, and rejecting such portions of it as are of least utility to young students, he might produce a book deserving the title of a *School-Lexicon to the Greek Testament*;" and this he has most fully accomplished.

That there has hitherto been a deeply felt and frequently expressed desire for such a book as the present, will be readily allowed by all who are conversant with the wants of young readers of the Greek Testament; and that Mr. R. has employed most successful diligence and pains upon this work, will be evident upon the most superficial examination. We do not think it can be needful at the present day to shew, that even a good general Greek lexicon must be a very bad and insufficient one for the New Testament: for when we consider the nature of the subjects treated, and the intellectual history of the men by whom they were treated, it will be plain, on the one hand, that the Greek language, as used by classic writers, had no words to express many of the ideas which the evangelical writers had to convey, and that, therefore, though they seldom coined new words, yet they were often obliged to modify, and sometimes entirely change, the meaning of those already in use; and, on the other hand, that men who were Jews, and had learned Greek only orally (a corrupt dialect of the Hebrew being their native tongue), when they wrote

it, would employ constructions, &c., unknown to the classic language: and such we find to be the case. Any one may easily satisfy himself of this fact by examining such words as αἰών, ἐμπόρια, δίδωμι, δέκα, λόγος, σπύρισμα, ἰσ, ἰσ, δός, &c. &c. To understand the Greek Testament, therefore, it is essential that such peculiarities should be explained. For learned readers, and those who can compare the Hebrew locations from which they have been drawn, various lexicons exist; but for those as yet unacquainted with Scripture criticism, no sufficient aid had been afforded, until attempted in the present work. Not only does it very fully discuss all such modes of expression and construction as are traceable to the Hebrew; but it is unusually copious on the particles, which have, as was to be expected, been most affected by Hebraisms. It is rich in phrases, literally translating and expounding all that occur in the New Testament. Not the least novel and interesting feature in the work are the neat, compressed, yet satisfactory notices of remarkable places and persons mentioned in the New Testament; and we may add, that the insertion of the grammatical inflection of all the proper names will not be without value and utility to the student; for though some of them are peculiar and unusual in their formation (see Μωυσις, &c.), yet they have hitherto been almost entirely excluded from works of this class.

We conclude by heartily wishing success to this Lexicon; assured that by so doing we are wishing success to the great cause of enlightened and rational Scriptural interpretation, and to the diffusion of a more thorough knowledge of the New Testament Greek than has hitherto been possessed save by the learned few. Other great recommendations are the form and price; both rendering the *Lexicon* peculiarly fit and eligible for its purposed use.

Captain Marryat's America.

[Third notice.]

ON looking to the separate Essays with which Captain Marryat follows up his groundwork of the Diary, we are arrested at the very first step by that which treats of the colloquial language of America. His illustrations of this subject are very entertaining; and, for variety's sake, we will transcribe a few of them. He tells us:

"I recollect once talking with one of the first men of America, who was narrating to me the advantages which might have accrued to him if he had followed up a certain speculation, when he said, 'Sir, if I had done so, I should not only have doubled and trebled, but I should have fourbled and fivebled my money.' One of the members of Congress once said, 'What the honourable gentleman has just asserted I consider as catamount to a denial'—(catamount is the term given to a panther or lynx). 'I presume,' replied his opponent, 'that the honourable gentleman means tantamount.' 'No, sir, I do not mean tantamount; I am not so ignorant of our language, not to be aware that catamount and tantamount are anonymous.' The Americans dwell upon their words when they speak—a custom arising, I presume, from their cautious, calculating habits; and they have always more or less of a nasal twang. I once said to a lady, 'Why do you draw out your words in that way?' 'Well,' replied she, 'I'd draw all the way from Maine to Georgia, rather than clip my words as you English people do.' Many English words are used in a very different sense from that which we attach to them: for instance,—a clever person in America means an

amiable, good-tempered person; and the Americans make the distinction by saying, I mean English clever. Our clever is represented by the word smart. The verb to admire is also used in the east, instead of the verb to like. 'Have you ever been at Paris?' 'No; but I should admire to go.' A Yankee description of a clever woman:—'Well, now, she'll walk right into you, and talk to you like a book; or, as I have heard them say, 'she'll talk you out of night.' The word ugly is used for cross, ill-tempered. 'I did feel so ugly when he said that.' Bad is used in an odd sense: it is employed for awkward, uncomfortable, sorry:—'I did feel so bad when I read that'—awkward. 'I have felt quite bad about it ever since'—uncomfortable. 'She was so bad, I thought she would cry'—sorry. And as bad is tantamount to not good, I have heard a lady say, 'I don't feel at all good, this morning.' Mean is occasionally used for ashamed. 'I never felt so mean in my life.' The word handsome is oddly used. 'We reckon this very handsome scenery, sir,' said an American to me, pointing to the landscape. 'I consider him very truthful,' is another expression. 'He stimulates too much.' 'He dissipates awfully.' And they are very fond of using the noun as a verb, as—'I suspicion that's a fact.' 'I opinion quite the contrary.' The word considerable is in considerable demand in the United States. In a work in which the letters of the party had been given to the public as specimens of good style and polite literature, it is used as follows:—'My dear sister, I have taken up the pen early this morning, as I intend to write considerable.' The word great is oddly used for fine, splendid. 'She's the greatest gal in the whole Union.' But there is one word which we must surrender up to the Americans as their very own, as the children say. I will quote a passage from one of their papers:—'The editor of the *Philadelphia Gazette* is wrong in calling abequiated a Kentucky phrase (he may well say phrase instead of word). It may prevail there, but its origin was in South Carolina, where it was a few years since regularly derived from the Latin, as we can prove from undoubted authority. By the way, there is a little corruption in the word as the *Gazette* uses it, abequiated is the true reading.' Certainly a word worth quarrelling about! 'Are you cold, miss?' said I to a young lady, who pulled the shawl closer over her shoulders. 'Some,' was the reply. The English what? implying that you did not hear what was said to you, is changed in America to the word how? 'I reckon,' 'I calculate,' 'I guess,' are all used as the common English phrase, 'I suppose.' Each term is said to be peculiar to different States, but I found them used every where, one as often as the other. 'I opine,' is not so common. A specimen of Yankee dialect and conversation:—'Well now, I'll tell you—you know Marble Head?' 'Guess I do.' 'Well, then, you know Sally Hackett?' 'No, indeed.' 'Not know Sally Hackett? Why she lives at Marble Head.' 'Guess I don't.' 'You don't mean to say that?' 'Yea, indeed.' 'And you really don't know Sally Hackett?' 'No, indeed.' 'I guess you've heard talk of her?' 'No, indeed.' 'Well, that's considerable odd. Now, I'll tell you—Ephrim Bagg, he that has the farm three miles from Marble Head—just as—but now, are you sure you don't know Sally Hackett?' 'No, indeed.' 'Well, he's a pretty substantial man, and no mistake. He has got a heart as big as an ox, and every thing else in proportion, I've a notion. He loves Sal, the worst kind: and if she gets up there, she'll think she

has got to Palestine (Paradise); arn't she a screamer? I were thinking of Sal myself, for I feel lonesome, and when I am thrown into my store promiscuous alone, I can tell you I have the blues, the worst kind, no mistake—I can tell you that. I always feel a kind o' queer when I sees Sal, but when I meet any of the other gals I am as calm and cool as the milky way, &c. &c. The verb 'to fix' is universal. It means to do any thing. 'Shall I fix your coat or your breakfast first?' that is, 'Shall I brush your coat, or get ready your breakfast first?' Right away, for immediately, or at once, is very general. 'Shall I fix it right away?'—i.e. 'Shall I do it immediately?' In the west, when you stop at an inn, they say—'What will you have? Brown meal and common doings, or white wheat and chicken fixings;—that is, 'Will you have pork and brown bread, or white bread and fried chicken?' Also, 'Will you have a feed or a check?'—A dinner or a luncheon? 'In full blast'—something in the extreme. 'When she came to meeting, with her yellow hat and feathers, was'n't she in full blast?' But for more specimens of genuine Yankee, I must refer the reader to Sam Slick and Major Downing, and shall now proceed to some further peculiarities. There are two syllables—*um*, *hu*—which are very generally used by the Americans as a sort of reply, intimating that they are attentive, and that the party may proceed with his narrative: but, by inflection and intonation, these two syllables are made to express dissent or assent, surprise, disdain, and (like Lord Burleigh's nod in the play) a great deal more. The reason why these two syllables have been selected is, that they can be pronounced without the trouble of opening your mouth, and you may be in a state of listlessness and repose whilst others talk. I myself found them very convenient at times, and gradually got into the habit of using them. The Americans are very local in their phrases, and borrow their similes very much from the nature of their occupations and pursuits. If you ask a Virginian or Kentuckian where he was born, he will invariably tell you that he was raised in such a country—the term applied to horses, and, in breeding states, to men also. When a man is tipsy (spirits being made from grain), they generally say he is corned. In the west, where steam-navigation is so abundant, when they ask you to drink, they say, 'Stranger, will you take in wood?'—the vessels taking in wood as fuel to keep the steam up, and the person taking in spirits to keep his steam up. The roads in the country being cut through woods, and the stumps of the trees left standing, the carriages are often brought up by them. Hence the expression of, 'Well, I am stumped this time.' I heard a young man, a farmer in Vermont, say, when talking about another having gained the heart of a pretty girl, 'Well, how he contrived to fork into her young affections, I can't tell; but I've a mind to put my whole team on, and see if I can't run him off the road.' The old phrase of 'straining at a gnat, and swallowing a camel,' is, in the Eastern States, rendered 'straining at a gate, and swallowing a saw-mill.' To strike means to attack. 'The Indians have struck on the frontier;—'A rattlesnake struck at me.' To make tracks—to walk away. 'Well, now, I shall make tracks;—from foot-tracks in the snow. Clear out, quit, and put—all mean 'be off.' 'Captain, now, you hush or put'—that is, 'Either hold your tongue, or be off.' Also, 'Will you shut, mister?'—i.e. Will you shut your mouth?

i.e. Hold your tongue? 'Curl up'—to be angry—from the panther and other animals when angry raising their hair. 'Rise my dander up,' from the human hair; and a nasty idea. 'Wrathy' is another common expression. Also, 'Savage as a meat-axe.' Here are two real American words:—'Sloping'—for slinking away; 'Splunging,' like a porpoise.

But one of the strangest perversions of the meaning of a word which I ever heard of is in Kentucky, where sometimes the word nasty is used for nice. For instance: at a rustic dance in that State a Kentuckian said to an acquaintance of mine, in reply to his asking the name of a very fine girl, 'That's my sister, stranger; and I flatter myself that she shows the nastiest ankle in all Kentuck.'

I must not omit a specimen of American criticism:—'Well, Abel, what d'ye think of our native genus, Mister Forrest?' 'Well, I don't go much to theatricals, that's a fact; but I do think he piled the agony up a little too high in that last scene.' The gamblers on the Mississippi use a very refined phrase for 'cheating'—'playing the advantages over him.' But, as may be supposed, the principal terms used are those which are borrowed from trade and commerce. The rest, or remainder, is usually termed the balance. 'Put some of those apples into a dish, and the balance into the store-room.' When a person has made a mistake, or is out in his calculation, they say, 'You missed a figure that time.' In a skirmish last war, the fire from the British was very severe, and the men in the American ranks were falling fast, when one of the soldiers stepped up to the commanding officer and said, 'Colonel, don't you think that we might compromise this affair?' 'Well, I reckon I should have no objection to submit it to arbitration myself,' replied the colonel. Even the thieves must be commercial in their ideas. One rogue meeting another, asked him what he had done that morning; 'Not much,' was the reply, 'I've only realised this umbrella.'

There is sometimes in the American metaphors an energy which is very remarkable. 'Well, I reckon, that from his teeth to his toe-nail, there's not a human of a more conquering nature than General Jackson.' One gentleman said to me, 'I wish I had all hell boiled down to a pint, just to pour down your throat.'

From the next essay, on Credit, and that on Penitentiaries, we offer no comment. Of the Army, to which another paper is addressed, Captain M. states that it consists of 7834, including all ranks, and is not a favourite service. The privates are chiefly Irish emigrants, Germans, and English deserters from Canada.

There is not much discipline, and occasionally a great deal of insolence, as might be expected from such a collection. Corporal punishment has been abolished in the American army, except for desertion; and if ever there was a proof of the necessity of punishment to enforce discipline, it is the many substitutes in lieu of it, to which the officers are compelled to resort—all of them more severe than flogging. The most common is that of loading a man with thirty-six pounds of shot in his knapsack, and making him walk three hours out of four, day and night without intermission, with this weight on his shoulders, for six days and six nights; that is, he is compelled to walk three hours with the weight, and then is suffered to sit down one. Towards the close this punishment becomes very severe; the feet of the men are so sore and swelled, that they

cannot move for some days afterwards. I inquired what would be the consequence if a man were to throw down his knapsack and refuse to walk. The commanding-officer of one of the forts replied, that he would be hung up by his thumbs till he fainted—a variety of piquetting. Surely these punishments savour quite as much of severity, and are quite as degrading as flogging."

MISCELLANEOUS.

Hood's Own; or, Laughing from Year to Year. Being former Runnings of his Comic Vein, with an Infusion of New Blood for general Circulation. 8vo. pp. 568. London, 1838. Baily and Co.

WE had intended to have entered at some length into the contents of this volume so full of curious, peculiar, and original humour; but like its author, though not with so irresistible an excuse as his, of bad health, we have deferred it so long, that, even were it a personal, instead of a bouquet of Annuals, we should be in the lateness of winter with any remarks we could now offer. Still it is our pleasant duty to state that it is a publication *est generis*, and one that must yield continual amusement to the lovers of fun and the admirers of wit. Nor is it a production, the whim and jocularity of which evaporate with the hour. It is a book to be taken up from time to time, and perused again and again with renewed gratification; and many of its points are so droll, and yet so recondite, that they are not all caught at a first or even second perusal. Unlike most performances of its kind, *Hood's Own* will entertain not only contemporaries, but posterity; and is so sterling in its grotesque views, that Hudibras himself will not be so generally understood and appreciated at the same distance of date. It is, in short, a comic library of text and embellishment; and ought to have a berth on every shelf, where we may turn for something to beguile the hour and drive away tedium or melancholy.

Fardorougha, the Miser; or, the Convicts of Lismonena. By W. Carleton, author of "Tales of Ireland," "Traits," &c. Pp. 468. Dublin, 1839. Curry, jun. and Co.

THIS very characteristic and interesting tale has appeared in the "Dublin University Magazine," which, consequently, takes it out of the English pale of criticism. All we need say is, that it is worthy of the talents of the author; the characters drawn from and to the life; and the whole an excellent picture of the country of its birth.

Precaution: a Novel. By the Author of the "Spy," "Red Rover," &c. London, 1839. Bentley.

THE seventh-fourth of "Bentley's Standard Novels," with a very whimsical frontispiece and appropriate vignette, by J. Cawse. The text has also received Mr. Cooper's revision.

LITERARY AND LEARNED.

UNIVERSITY INTELLIGENCE.

OXFORD, 6th July.—The Rev. H. Richardson, M.A. of Trinity College, was admitted *ad eundem*.

The following degrees were conferred:—

Masters of Arts.—T. A. Whitter, Brasenose College, Grand Compounder; Rev. S. F. Dickson, Brasenose College; Rev. S. A. Fyler, Trinity College; Rev. J. Walker, Fellow of Wadham College.

Bachelor of Arts.—G. A. F. Fitz-Wygram, Christ Church.

Bachelor in Music.—G. F. Flowers, Lincoln College.

ROYAL SOCIETY OF LITERATURE.

Anglo-Saxon Literature.

IN our last we copied as much as we could on the subject of Anglo-Saxon Riddles, &c.; but

some illustrations yet remain, and Mr. Wright has furnished us with much curious research on this very popular branch of inquiry.

"The following, for example, seems to give us the first traces of that doughty hero, John Barleycorn, so famous in the days of ballad-singing."

The Saxon version may be dispensed with, as the subjoined is a literal translation:—

"A part of the earth is prepared beautifully, with the hardest, and with the sharpest, and with the grimmest, of the productions of men, cut and turned and dried, bound and twisted, bleached and awakened, ornamented and poured out, carried afar to the doors of people, it is joy in the inside of living creatures, it knocks and alights these, of whom before while alive a long while it obeys the will, and expostulateth not, and then after death it takes upon it to judge, to talk variously. It is greatly to seek by the wisest man, what this creature is."

"The subject of another seems to be the aureole of the butterfly, and its transformations; by which it would appear that our forefathers were, at times, diligent observers of nature:—

"I saw tread over the turf ten in all, six brothers, and their sisters with them, they had a living soul; they hanged their skins, openly and manifestly on the wall of the hall, to any one of them all it was none the worse, nor his side the sorer, although they aboult thus, bereaved of covering, (and) awakened by the might of the guardian of the skies, bite with their mouths the rough leaves; nothing is renewed to those who before coming forth let their ornaments lie in their track, to depart over the earth."

"The Anglo-Saxons were especially partial to riddles founded on Scripture, thinking, perhaps, that they exhibited in solving them their acquaintance with the Sacred Volume. The subject of the following must be the patriarch Lot and his two daughters and their sons:—

"There sat a man at his wine, with his two wives, and his two sons, and his two daughters, own sisters, and their two sons, comely first-born children; the father was there of each one of the noble ones, with the uncle and the nephew: there were five in all men and women sitting there."

"Of the next, it is not so easy to give a probable solution:—

"I am a wonderful creature, I may not speak a word, nor converse before men, though I have a mouth, with a spacious belly: I was in a ship, with more of my race."

We come now to the cosmographical notions and popular errors of our Saxon ancestors:—

"The world, in the larger sense of the word (*mundus, alipes*), was designated among the Anglo-Saxons by a name borrowed from their old mythological ideas, *middan-geard*, or the middle yard or region, which was afterwards gradually corrupted into the old English word 'middle-earth.' All that is within the firmament, says the tract just mentioned, 'is called middan-geard, or the world. The firmament is the ethereal heaven, adorned with many stars; the heaven, and sea, and earth, are called the world. The firmament is perpetually turning round about us, under this

"This riddle affords us an example how certain ideas run through the popular literature of different nations at all periods. M. Jubinal, in his 'Nouveau Recueil de Contes, Dits, Fabliaux,' &c. (vol. I. 8vo. Paris, 1839), p. 281, has quoted an early French fabliau, 'Le Martyre de Saint Bacus,' where the god of the vine takes the place of Sir John Barleycorn, just as the juice of the grape in the country where it was composed occupies the place of the liquor of which the English hero was a personification."

"This riddle is curious, as exhibiting a repetition of rhyming words, like those which have been attempted by some of the lighter poets of the present day. Single lines of this kind are not uncommon scattered over the Anglo-Saxon poetry of the best age, as 'wide and side' (*wide and broad*), in Beowulf and Caedmon; 'blowan and growan' (to blossom and to grow) in the Ex. MS. fol. 109, r.; &c. We find sometimes three such rhyming words, as 'flood blod ge-wod' (blood pervaded the blood), Caedm. p. 307. In the Exeter MS. there is one whole poem (which was published by Conybeare), written entirely in rhymes of the most fantastic description. The whole of these verses are extremely obscure and difficult to understand—a proof that rhyme was a great trial of the ingenuity of the writer, and by no means congenial to the language."

earth and above, and there is an incalculable space between it and the earth. Four and twenty hours have passed, that is one day and one night, before it is once turned round, and all the stars which are fixed in it turn round with it. The earth stands in the centre, by God's power so fixed, that it never swerves either higher or lower than the Almighty Creator, who holds all things without labour, established it. Every sea, although it be deep, has its bottom on the earth, and the earth supports all seas, and the ocean, and all fountains and rivers run through it; as the veins lie in a man's body, so lie the veins of water throughout the earth.' The north and south stars, as we are told in another place, of which the latter is never seen by men, are fixed, and are the poles of the axis on which the firmament turns. Falling stars are igneous sparks thrown from the constellations, like sparks that fly from coals in the fire. The earth itself 'resembles a pine-nut, and the sun glides about it, by God's ordinance, and on the end where it shines it is day by means of the sun's light, whilst the end which it leaves is covered with darkness until it return again.' The writer of this treatise, in one or two instances, mentions and confutes what appeared then to the learned to be the popular errors of their age, such as that of 'some unlearned priests' who said that leap-year had been caused by Joshua when he made the sun stand still. The priests, it will be observed, are frequently the butt of the sneers of the scholars in the tenth century. Such were the notions inculcated by the popular scientific books among our Anglo-Saxon forefathers, many of them erroneous in themselves, but at the same time consonant with the doctrines of the greatest scholars who had preceded, or who were contemporary. The range, however, of these books must have been narrow, in comparison with the mass of the people who were uninstructed. The ideas adopted by the latter were far more erroneous, and were often the mere legends of the popular mythology, as we see by such writings as the dialogues of Saturn and Solomon, and Adrian and Rithmus, which were probably intended for recitation among the common people. In the latter of these dialogues, to the question, 'How large is the sun?' the reply is, 'Larger than the earth;' and this is deduced from the circumstance that it shines on all parts of the earth. The spherical form of our planet was universally acknowledged, although it was erroneously placed in the centre of the system. An early Latin writer compares the universe to an egg, in which the earth is the yolk, with the sea surrounding it resembling the white of the egg, while the firmament, supposed to be inclosed in fire, is the shell." It is doubtful, however, if it were not the most common impression that this round mass on which we live swam in the water, that the part we inhabit and know was a small portion of the surface which stood above the waves, and that the sun dived into the ocean each evening, and arose out of it on the following morn. The ideas which the Anglo-Saxons held with regard to that portion of the earth which was then believed to be alone habitable, were derived indirectly or immediately from the writings of the ancients; and they were to the whole more correct than might be expected. Their maps were undoubtedly made after

"In an English poem of the thirteenth century, in MS. Harl. 2277, fol. 133, we have the following definition of the earth:—
'Urthe is amide the see, a fute (flat) bel and round.'"

Roman models. A map of the tenth century, in the British Museum, accompanies the *Periegesis of Priscian*,* which, with the slight sketch given by Orosius, and the work of Solinus, were the chief authorities in geography. Books of cosmography were sought eagerly at an early period,† and we need not be surprised if their popularity depended most frequently on the number of wonderful relations which they contained. The stories of this kind given by Pliny the Elder, and reproduced by Solinus, were the foundation of all the extravagant fables concerning the wonders of distant lands which were so widely prevalent during the middle ages; but the vague manner in which these writers spoke of them was not enough for the curiosity of the multitude, and the outline they furnished was soon filled up in spurious works, like the famous letter of Alexander the Great to his preceptor Aristotle, in which the conqueror of the East describes minutely all the monsters of India. This tract must have been written at an early period, for we find an Anglo-Saxon translation of it, with some other pieces of a similar kind, in manuscripts of the tenth century.‡ We find the Anglo-Saxons at an early period distinguished by the same spirit of adventure, which has been so active and fruitful among their descendants. They were anxious to explore the distant countries, whose existence had been made known to them by the books which the missionaries imported. Even so early as the seventh century they were in the habit of going to Rome by sea, a voyage in which the pilgrims necessarily incurred many perils. At the end of this century, a Frankish bishop, named Arculf, who was returning from the Holy Land, and had visited Constantinople, Damascus, and Alexandria in Egypt, as well as many of the islands of the Mediterranean, was thrown by bad weather on the western coasts of England, where he became acquainted with the abbot Adamnan. The latter carefully stored up the information which the traveller communicated to him, and afterwards committed it to writing in a treatise which is still preserved. It is probable, indeed, from many circumstances, that the Anglo-Saxons themselves made frequent visits, not only to Italy, but also to the East. King Alfred, who in this, as in other things, merited well the character given him by historians of being 'a diligent investigator of unknown things' (*ignotarum rerum investigacioni solerter se jungabat*), sent Sighehm, bishop of Sherburn, in 883, to India, to visit the scene of the labours of St. Thomas and St. Bartholomew; and Sighehm not only reached in safety this distant land, but he brought back with him many of its productions, and particularly some gems and relics which were still preserved in his church in the time of William of Malmesbury. The present day cannot furnish a more intelligent account of a voyage of discovery, than that taken down by Alfred from the mouths of Obshere and Walfstan, one of whom had sailed to the North Cape, and the other along the northern shores of the Baltic, and which that

monarch has inserted in his own version of Orosius. The map of the tenth century, mentioned above, is far more correct than the generality of maps which we find in old manuscripts at a later period; its chief inaccuracy lies in the distorted shape given to Africa, which is here a long narrow slip of land running out from east to west; but the coasts of India and Eastern Asia are not ill defined; there are few of the fabulous indications which appear afterwards in this part of the world; and Paradise does not occupy the place of the isles of Japan, as it did after the voyage of St. Brandan became popular in the twelfth century."

FINE ARTS.

WELLINGTON MILITARY MEMORIAL.

AT a meeting of the General Committee, held on Friday the 12th, His Grace the Duke of Rutland in the chair, and attended by R. R. H. the Duke of Cambridge, the Duke of Richmond; the Marquesses of Downshire, Londonderry, and Tavistock; Lords Jersey, Aberdeen, Liverpool, Palmerston, Lake, Hill, Forrester, and Colborne; Sirs G. Cockburn, S. R. Lushington, R. Fitz-Wygram, H. Halford, A. Cooper, F. Trench, J. L. Lushington, J. Dallas; Mr. J. Wilson Croker, Major Smith, Dr. Croly, and Messrs. Simpson and Rainbow; the proceedings relating to this National Monument were, we rejoice to say, brought to a harmonious and satisfactory arrangement.

A colossal bust of the hero of Waterloo, modelled by Mr. Wyatt, was in the room; and must, we imagine, have contributed greatly to this result; for it is not only an admirable likeness, but one of the noblest works of art that any time or country has produced.

The discussion which took place has been reported at full length in the "Morning Post." From it, we observe, that the Duke of Richmond, and two or three other members of the committee, entertained an opinion that it was desirable to offer the design to general competition; but the position in which the matter stood, in consequence of antecedent resolutions, legitimately carried and confirmed, being referred to, and other explanations given by the chairman, Lord Londonderry, Sir F. Trench, Mr. Croker, &c., it was unanimously agreed to ratify the nomination of Mr. Wyatt, to perform this great work; and the Duke of Richmond, the Earl of Aberdeen, and Lord Palmerston, concurred in the general sentiment, that they would now cordially promote the subscription, and do every thing in their power to ensure the immediate execution of the Equestrian Statue, to be placed on the arch at Hyde Park Corner. To this, therefore, no further obstacle can now be anticipated, as her majesty and her ministers have already sanctioned it, and only reserved the proper privilege of having the model submitted for their approbation.

As the affair is thus happily disposed of, we shall say nothing of the expediency of public competition, except that we should have thought the Nelson Testimonial enough to surfeit any appetite for that sort of election. On the question of the fitness of the Arch to receive and exhibit to advantage a work of this description, as it is a case of mere taste, we should be sorry to offer a dogmatic opinion. But we are strongly fortified in our judgment that it is peculiarly adapted for the purpose: *first*, by the sentiments of so accomplished a critic as Lord Aberdeen; and *secondly*, by personally knowing years ago (long before this tribute was ever thought of) that the architect, Mr.

Decimus Burton, the most competent individual in existence to decide on its propriety, held such an addition to be essential to the beauty and finish of his own graceful erection. As an instance that coming events may cast their shadows before, it is a curious anecdote that Mr. Burton and Mr. Wyatt happened to meet for the first time at our table; and the projected monument to the memory of King George III. happening to be one of the topics of conversation, it was agreed how excellent it would be if this very arch could be surmounted, in the manner now about to be done, by an equestrian statue of that monarch, or a quadriga bearing him in triumph. What was thought applicable to a great king, may not be inappropriately devoted to his greatest subject; and if ever such honour was deserved, it is due to

The Immortal Wellington!

The Daguerrotype.—M. Arago's report has been published, but contains little that has not already appeared in the pages of the *Literary Gazette*. He touches first on the discovery of the camera by Porta, the introduction of the single lens, and the invention of the achromatic. He then proceeds to analyse the various preparations of silver which have been employed in photogenic drawing, and winds up with the immense advantage of the Daguerrotype for copying Eastern monuments, inscriptions, &c., without, however, disclosing what is the substance employed in preparing the plates, and only stating that it is a *reactive* of much greater sensibility than any hitherto employed. He also alluded to the importance of the discovery, which he contended was proved by the avidity with which the subject has been taken up by other nations, and the *trifling* pretexts* they had seized to establish their priority of invention.

Portrait of the Duke of Wellington.—We have been to see a full-length portrait of His Grace, painted by J. Lucas for the Corporation of the Trinity House, and about to be engraved by H. Cousins (for Mr. Boys, at whose residence it remains on view). The Duke is painted as Master of the Trinity House, in a solid and clever manner. The arms are folded, the attitude simple, and the likeness good. Altogether it is a simple and characteristic performance, and literally of the life size. It does great credit to the artist's talents as a painter, who already stands high as an engraver.

THE DRAMA.

Drury Lane.—Mr. Hammond, the lessee of the Strand Theatre, which he has conducted with much spirit and propriety, has, it is stated, taken Drury Lane for the ensuing season.

Covent Garden Theatre.—This theatre closed on Tuesday with the triumphant play of *Henry V.*, and the house crammed to the ceiling. At the fall of the curtain, Mr. Macready addressed the audience in a most feeling and impressive manner, slightly and respectfully touched upon his effort on behalf of the drama, acknowledged the support he had received, and, without casting a reflection upon any party whatever, noticed the termination of his managerial career in consequence of the proprietors not acceding to the terms he considered himself justified in offering them. The applause was tremendous, and the stage was almost

* M. Arago is always sufficiently national, and partial to the claims of his own country and countrymen. In this instance he is evidently unjust to the claims of others; and even more French than usual.—Ed. L. G.

* MS. Cotton. Tiber. B. v. fol. 58, v.
† *Basilic. Epist.* p. 111. Some persons writes to Bishop Lullia, "Ceterum libri cosmographicorum necdum nobis ad manus venerunt: nec alia apud nos exemplaria, nisi picturis et litteris permolesca." The latter part of the sentence is curious, though at present not quite clear.

‡ "The Anglo-Saxon version of Aristotle's letter is found MS. Cotton. Vitell. A. xv., along with Bosworth and Judith. It is preceded by an Anglo-Saxon tract on the wonders of the East, which occurs again in Anglo-Saxon and Latin in MS. Cotton. Tiber. B. v.; in both these accompanied by drawings of a very extraordinary kind, and, in the latter MS. many of them executed in a style much superior to the generality of Anglo-Saxon pictures."

literally covered with flowers and chaplets flung upon it from every quarter.

Whatever the causes, we sincerely lament that Covent Garden and the country of Shakspeare have been deprived of the services of Mr. Macready; and at the very period when they had produced their effect upon the public. So accustomed had we become to trickery, falsehood, and disgraceful practices in every thing connected with the great theatres, that even the high individual character of this gentleman was insufficient, at his offset, to obtain the confidence he sought for his professions. It has taken nearly two years to convince the world, that a manager could honourably and punctiliously fulfil every engagement he made, redeem every pledge he gave, conduct himself liberally towards his professional associates, and renounce, no matter at what sacrifice or loss, every custom which could bring censure or disrepute upon the theatre of which he had purchased the control. We cannot but think it short-sighted policy to have stopped this tide of well-doing. Without venturing to say a word upon those who may be Mr. Macready's successors, either immediately or hereafter, it appears to us, that far more permanent advantages were likely to accrue to all concerned from his continuing, with all the improvements and the high reputation he had established, than from any change that could take place. But, putting private and proprietary considerations out of the question, those who enjoy patent rights, and are protected by monopolies, owe a duty to the public; and, seeing the stage not only redeemed from infamy, but set on a higher and firmer footing than before, nothing short of necessity ought to have induced the risk of another fall into the abyss of corrupt speculation and beggary.

Come what may, Mr. Macready has solved the problem which was despaired of; and proved that the drama need not be lost to England, unless betrayed by those under whose auspices it may be placed. He has fought a noble fight, and achieved not only a glorious personal triumph, but a national victory, which has delivered us, as a people, from a great literary and moral reproach, disgraceful to the genius that lives amongst us, and to the land which gave birth to Shakspeare.

To-day he is to be entertained at a public dinner;* and the royal, noble, and enlightened, concur in bearing testimony to his high deserts on the occasion. A ridiculous notion has been broached, that because many of the stewards and leading persons whose names have been advertised happen to belong to the ministerial party, that there are some political ingredients mixed up with this tribute. Nothing can be more inconsistent with the truth; and numbers of distinguished men, holding the opposite opinions in the staunchest spirit, are hastening to demonstrate their sense of the merit of the individual, and of the singular service he has performed for the most important of all national amusements, by his generosity, judgment, devotedness, and talent. He has justly won the wreath which binds his brow, and the approbation of his country. He has shewn us what the stage ought to be, and would be, if rightly directed. If we never see it so again, we can proudly refer to this period, and refute every argument against our national character, founded on the results of mistaken avarice in the holders of the patents, and

shameful behaviour in their tools and instruments.

In making these cursory remarks, we beg to be understood as meaning nothing prospectively. Time alone will enable us to ascertain how far praise or the reverse may be due to whoever undertakes the arduous task of succeeding Macready. For his own sake we should be glad at his return to his profession, unencumbered by the toils of management; for no physical powers could long sustain the prodigious labour and anxiety of bringing out dramas in the style he has been producing them, added to the fatigue of playing the principal parts. But we will say no more of ourselves, but conclude with a

SONNET,

Inscribed to Mr. Macready on his brilliant and successful restoration of the dramas of Shakspeare to the English Stage.

From the base fetters that erewhile confined
The native grace of his majestic gait,
Which sacrilegious hands had dared to bind
Upon his free-born limbs, (ignoble fate!)
At length released,—no! Shakspeare walks elate,
Free as the sportive fawn or mountain wind,
Disclosing in his high and palmy state
Ethereal grace with godlike vigour joined.
Reproach it were, MACREADY, if the muse,
That loves to consecrate with bright renown
Each great and noble action, should refuse
For this thy brows with amaranth to crown:—
Yes, for this pious service shall thy name
Descend with Avon's bard in deathless fame.

R. B. S.

VARIETIES.

H. B. is as busy with caricatures as our legislature are towards the end of the session. No. 603, "A Pressure from Without." The Chancellor of the Exchequer on horseback, with his budget in his *valaise*, is stopped by John Bull *à la footpad*, to whom the finance minister gives "Uniform Penny Postage," and prays to have something back to meet his expenses on the road. 604, "A Pair." Sir E. L. Bulwer a front view, Mr. Disraeli a back view; amusing caricatures of modern dress and figure. Sir E. L. Bulwer's likeness is well caught, and would be still more correct, but for the exaggeration of the eyes in looking upon his fellow "pair." 605, "Design for a Wellington Testimonial." A classical and clever performance, partly imitating Wyatt's superb horse* in Cockspur Street, and partly the statue in Hyde Park, represented by the Duke, nude, and reining in the Bucephalus, which is girthed "Opposition." The animal, and the position of the group, are very spirited.

Portrait of the Duchess of Sutherland.—Mr. Minasi has just executed one of his careful and beautiful likenesses in pen and ink. It is a study of the head of the Duchess of Sutherland, very noble and aristocratic, as is the original. A fine child, in outline, completes a very charming group.

The Centre Table at Cooper's, New Bond Street, kept *perdu* from the time of the Revolution, and said to have formerly belonged to Versailles, considered as a work of art, is almost unrivalled. It is supported by three pedestals of the finest *bronze doré*, whose groups of figures are from the designs of Albert Durer. In the centre is a portrait of Madame Fontanges, by Mignard, the only one known by the master; around which are sixteen enamels of exquisite beauty, of the celebrated ladies and queens of France. In a series of such fascination, wherein the olden looks like the

golden age, it is not easy to say who is the fairest; but there are two, *la belle Laure de Noves*, and *Marie de Hainaut*, wife of Louis II., on which the eye lingers longer than on the others. In the dresses, jewels—each splendid and different from the rest—the painter's skill is perfect.

The Newspaper Press Benevolent Association observed its second anniversary at Freemasons' Tavern, on Saturday last, Lord Lyndhurst in the chair; Lord Brougham, the Nabob of Oude, the President of the Royal Academy, the Lord Mayor, and other distinguished guests, assisting. The musical talent brought forward on the occasion was of extraordinary variety, and including some of the finest female singers in the capital. The appearance also of ladies at the dinner-table, gave a new feature to the entertainment; whilst the addresses to the company by the chairman, Lord Brougham, and other visitors, and Mr. Vincent Dowling, President of the Association, filled up the day with a more than usual share of social pleasure and benevolent sympathy. It was gratifying to hear from the last-mentioned gentleman, that the Society was firmly established, and had already a fund of nearly 1000*l*. New contributions were announced.

British Museum.—Great alterations and improvements, both externally and internally, are, it is stated, about to be made at the British Museum.

Strange Effects of Ballooning.—In Mr. Green's published account of the recent ascent of the great Nassau balloon, he says—"The gentlemen who ascended with me were Mr. R. Crayshaw, and a lady, Mr. Dalby, Mr. Hughes, and Mr. Spencer."

LITERARY NOVELTIES.

LIST OF NEW BOOKS.

The Edinburgh Review and Critical Journal, No. 140, July, 6*s*.—A Synopsis of the Birds of North America, by J. J. Audubon, 8vo. 12*s*.—New Translation of the Hebrew Scriptures, by R. H. Carne, No. 1, 2*s*. 6*d*.—History of British Reptiles, by Prof. Bell, 8vo. 8*s*. 6*d*.; royal 8vo. 17*s*.; imperial 8vo. 22*s*. 6*d*.—Discourses on Various Subjects, by the Rev. J. Parry, 12mo. 6*s*.—Lectures on the Life and Character of Heneiah, by Rev. W. Nicholson, fcap. 3*s*. 6*d*.—The Rhine: Legends, Traditions, &c., Cologne to Mainz, by J. Snowe, 3 vols. 8vo. 3*s*.—Five Sermons preached at Oxford, by the Rev. W. F. Hook, 3d edition, 3*s*.—Instructions for collecting Insects, by A. Ingen, new edition, 18mo. 3*s*.—Chap Riches, Selections from Divines, 3mo. 2*s*.—Calvary, or, the Cross of Christ, by M. Daniell, post 8vo. 8*s*. 6*d*.—Robertson on the Teeth, 2d edition, 8vo. 7*s*. 6*d*.—C. E. Bernard's Arithmetical Perspective, 8vo. 10*s*. 6*d*.—Kyd the Buccaneer, 3 vols. post 8vo. 2*s*.—Dr. Solomon's Jewish Sermons, translated by Miss Goldsmid, 8vo. 7*s*. 6*d*.—Sabbath Musings, and Every-day Scenes, fcap. 6*s*.—Roads and Railroads; Vehicles and Modes of Travelling of Ancient and Modern Countries, 12mo. 6*s*.—Forty Sermons by the Rev. R. Cattermole, 8vo. 16*s*.—The Great Western Railway Guide, 12mo. 4*s*.—Thoughts on the Sensibility of the Imagination, post 8vo. 6*s*.—Edinburgh Cabinet Library, Vols. XXV. XXVI. and XXVII., British America, 15*s*.—Robson's Greek Vexicon, on the basis of Robinson, 12mo. 10*s*. 6*d*.—The Authors of France, by A. Albitte, 24mo. 3*s*.—Poems by Mrs. Wolferstan, new edition, 8vo. 7*s*. 6*d*.—The Croydon Railway, with Map and Views, 18mo. 2*s*.—The First Communion, by F. S. Parker, 18mo. 2*s*.—T. J. Ousley's Poems, 3d edit. 12mo. 6*s*.—Hamilton King, by the Old Sailor, 3 vols. post 8vo. 3*s*. 6*d*.—Polack's New Zealand, new edition, 2 vols. 8vo. 16*s*.

METEOROLOGICAL JOURNAL, 1839.

July.	Thermometer.	Barometer.

GOETHE'S FAUST;

Translated into English verse, with copious notes.

By J. BIRCH, Esq.

And Illustrated with Twenty-nine Engravings on Steel, by J. Brain, after M. Retzsch, royal 8vo. 16*l.*; India, 21*l.*

"A new translation of this literary miracle has just appeared, which will, we think, prove infinitely more complete and more of the attempts to depict the mind of Goethe. We are not among the number of those who pick out level passages in a work of sublimity and pathos, in order to obtrude with a sneer some rhetorical deformity. Mr. Birch is, in truth, most deeply imbued with Goethe's mode of thought; and therefore it is that, in this translation, is excited all that varied and intense interest which so charms in the original. The simplicity of Margaret's character is most felicitously preserved. We now conclude with one brief remark, which we make only after very mature consideration.—Mr. Birch has done for Goethe, in English, what Schlegel, in German, has done for William Shakespeare—he has given us the honest translation of a brother poet."—*Mirror*.
Black and Armstrong, 8 Wellington Street, Strand.

BOTANY.

4th edition, with 155 Figures, price 10*l.* 6*d.* in cloth.
WITHERING'S SYSTEMATIC ARRANGEMENT of BRITISH PLANTS. Condensed and brought down to the present period; with an Introduction to the Study of Botany.

By WILLIAM MACGILLIVRAY, A.M.
The descriptions given are so simple that the young botanist to determine every species that might come in his way without the assistance of others.

London: Scott, Webster, and Geary.

FIRESIDE EDUCATION;

By S. G. GOODRICH.

Author of "Peter Parley's Tales."

"In this volume, I address myself specially to parents, though I deem that the subject may well claim the attention of teachers, of guardians of children, and indeed of every member of society."—*Anti-Slavery Reporter*.
London: William Smith, 115 Fleet Street; Fraser and Crawford, Edinburgh; Curry and Co. Dublin.

THE SUBURBAN GARDENER and VILLA COMPANION; comprising the Choice of a Suburban or Villa Residence, or of a Situation on which to form one; the Arrangement and Furnishing of the House; and the Laying-out, Planting, and general Management of the Garden and Grounds; the whole adapted for Grounds from One Perch to Fifty Acres and upwards in extent; and intended for the Instruction of those who possess little of gardening and rural affairs, and more particularly for the use of Ladies. Illustrated by numerous Engravings.

Edited by S. C. LONDON, F.R.S., &c.
"The most complete work on villa gardening that has ever appeared in our language."—*Quarterly Journal of Agriculture*.
"The most original, and calculated to be the most extensively useful, of all Mr. London's works; and we have no doubt it will attract great attention in the appearance of the garden and grounds of our suburban and other small villas."—*London's Chronicle*.
"A complete and useful work on the art of gardening, and the culture of the country, effected in the appearance of the labourer's cottage."—*Times*.

London: Longman, Orme, and Co.

THE NORMANS IN SICILY.
By HENRY GALLY KNIGHT, Esq. M.P.
Together with the History of the Normans; being a Series, now complete, of Thirty Drawings of the Saracenic and Norman Remains of Sicily. Vols.

John Murray, Albemarle Street.

TWELVE SERMONS, delivered in the New Temple of the Israelites at Hamburg.
By Dr. GOTTHOLD SALOMON.
And Translated from the German by ANNA MARIA GOLDSMID.

"Among the motives which have led to the publication of these Sermons, is the hope that from their perusal many of our Christian countrymen may derive a better knowledge of the astonishing faith of the Jews. . . . To those Sermons I confidently ask the attention of the kindly and conscientious Christian. I may add, that many of them may be found available for persons of every religious denomination and sect. If in religious discussion, men of all creeds would seek, not points of difference, but points of agreement, how much of the strife and bitterness that deform this earth would disappear!"—*Quarterly Journal of Agriculture*.
John Murray, Albemarle Street.

THE JOTTING BOOK; A Political and Literary Repository, intended as an Argument for the Genuine Finality of the Reform Bill; being Extracts from the Story of a Rascally Opinionist in whatever regards the Constitution of England.

2d edition.
London: Hamilton, Adams, and Co. Birmingham; Knott, Houston, and Co. Dublin; William Curry and Co. Newcastle Street.

FARDOROUGH the MISER; or, the Convicts of Limerick.
By WILLIAM CARLTON.
Author of "Tales of Ireland," "Tales and Stories of the Irish Peasantry," &c. &c.

"We think it decidedly one of the best stories Mr. Carlton has ever written."—*Edinburgh Review*.
"He has wrought out a tale of surprising interest from the least promising materials."—*Edinburgh New Leader*.
"It is the very soul of pathos. We doubt whether the author has ever written any thing that compares it in delicacy, tenderness, and touching beauty."—*Edinburgh Review*.
"This story is one of the best that has been told, and has been translated from his pen."—*Edinburgh Courier*.
Dublin: Wm. Curry, Jun. and Co. 5 Upper Beckett Street; Samuel Holdsworth, London; F. and J. B. Colburn, Edinburgh; sold by all Booksellers.

CAPTAIN MARRYAT'S AMERICA.
"The most readable, and one of the most valuable works which has yet appeared on America. As pointed in composition, as tinged with humour, and, allowing for the absence of story, as amusing as one of his novels. In the grave and more general views it exhibits much sound sense and shrewdness."—*Standard*.
"Worthy of attentive consideration on both sides the Atlantic."—*Athenaeum*.
London: Longman, Orme, and Co.

In 8 vols. fcap. 8vo. with Portrait, and View of Somerset Church, price 10s.

THE WORKS of the Rev. GEORGE HERBERT. New first collected. The Poems contain the Temple (the Synagogue by the Rev. Christopher Harvey); the Latin Poems of Herbert; and the original Poems, never before printed. With Notes by S. T. Coleridge.

London: H. Baillière, 219 Regent Street.

MRS. JAMESON'S WORKS.
WINTER STUDIES and SUMMER RAMBLES in CANADA. 3 vols.

2. **The Lives of Celebrated Female Sovereigns.** 3 vols. 8d. edition.
3. **Female Characters of Shakspeare's Plays;** or, Characteristics of Women. 3 vols. 8d. edition.
4. **Visits and Sketches at Home and Abroad.** 3 vols. 8d. edition, nearly ready.

"Mrs. Jameson is lively, eloquent, and discriminating. She has great quickness of fancy, readiness of illustration, and a sense of whatever is noble, heroic, and natural. She speculates upon the character of her own with singular ease and boldness, and inclines generally to the gentle and affectionate side. We never tire in the company of this intelligent and exuberant lady. When she sees we are weary of her spiritism, she tries what her eloquence can do; and when we fail, she begins to scold. Sovers of all hearts and editors."—*Athenaeum*.
Saunders and Otley, Publishers, Conduit Street.

POEMS, now first collected.
By LORD LEIGH.
Edward Moxon, Dover Street.

CHRISTIAN WATCHFULNESS, in the Prospect of Sickness, Mourning, and Death.

THE OLD TESTAMENT, with a Commentary, consisting of Short Lectures for the daily Use of Families.
By the Rev. CHARLES GIRDLESTONE, M.A.
Rector of Alderley, Cheshire.
In this edition of the Holy Bible, it has been the chief object of the Editor to furnish families with an exposition for daily reading. The Scripture is divided into paragraphs of a convenient length, and the explanatory and practical matter is digested, under each portion, into one consecutive lecture, so as to demand of the reader no previous study or attention.
J. G. F., and J. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall; and J. H. Parker, Oxford.

Also, lately published,
Volume the First (containing the Pentateuch), price 18s.; and
Volume the Second (Historical Books), 18s.; or in Parts, at 2s. each.

And, by the same Author,
The New Testament, with a Commentary.
In 3 vols. or Four Parts, price 11s. 16s.

In 8 vols. 8vo. price 11s. 16s. to be bound, the 2d edition, dedicated by permission to the Most Rev. the Archbishop of Canterbury and Armagh.

A TREATISE on the CHURCH of CHRIST, designed chiefly for the Use of Students in Theology. With a Supplement, containing Replies to Objections, especially from unqualified Prophecy.
By the Rev. WILLIAM PALMER, M.A.
Of Worcester College, Oxford; and a Member of "Original Literature."
J. G. F., and J. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.
"The Supplement may be had separately by the Publishers of the First edition, price 6s."

The Bivouac. By W. H. Maxwell, Esq.
Moorwood. By W. H. Ainsworth, Esq.
Zohrab. By J. Marier, Esq.
Anastasia. By T. Hope, Esq.
G. P. R. James's Darnley, Philip Augustus, De
Forme, Henry Masterion.
Precaution. By the Author of "The Pilot."

The Last Days of Pompeii. By Sir Lytton Sal-
ter, Bart.
Captain Blake; or, My Life. By W. H. Max-
well, Esq.
Captain Marryat's Peter Simple, Jacob Faith-
ful, Japhet in Search of a Father, King's
Own, Midshipman Easy, Newton Forster,
Pacha of Many Tales, &c.

* * * The Copyright of these works being the property of Mr. Bentley, they can only be procured in the Standard Novels, which Series is wholly unconnected with any other Collection of Novels.

A List of the whole of the Works now comprised in the Standard Novels may be obtained of all Booksellers.

RICHARD BENTLEY, NEW BURLINGTON STREET,

Publisher in Ordinary to Her Majesty.

REVIEW OF NEW BOOKS.

Poems, now First Collected. By Lord Leigh. 12mo. Pp. 402. London, 1839. Moxon.

WHEN Mr. Chandos (now Lord) Leigh published, in separate forms, portions of these poems, here collected together and accompanied by others worthy of their talent and sweetness, it was a pleasure to us to pay to them that tribute of approbation which they so truly merited from every lover of the muse. It is therefore unnecessary for us to revert to them further than to refresh the public memory with our record of their beauty, before we pass on to the novelties for the first time presented to our notice.

Taking the volume as a whole, we would say that it is a charming garland of poetic flowers, of many a varied kind and hue. The familiar epistles display sportiveness and wit; the descriptive verses are rich in scenery and sentiment; the elegies are full of feeling; and the productions of miscellaneous order include fancy, tenderness, mind, reflection, life, and nature.

We shall begin with a quotation from the "Fourth Epistle to a Friend in Town," which will remind the reader of Pope, and yet be readily applied to our more modern day:—

"Orfelus gives you feasts to glut his pride;
You ask a loan of him, he turns aside.
While Bavius prates of friendship in his verse,
Yet from the dearest friend withholds his purse.
The generous man—he whom the world commends—
Fills high the sparkling wine-cup for his friends;
And yet this hospitable reveller lives
For self—for self alone his banquet gives.
What though this Pharisee exalts his horn
On high, and views a brother's woes with scorn;
When placed before the judgment-seat of Heaven,
The scorned may be lost, the scorn'd forgiven!"

Fame cries that Applus, generous wight, but lives
To bless his neighbour: all he has he gives.
Though, in subscription be his name enroll'd,
His virtue glitters—'tis not sterling gold:
No prayer of those he has relieved by stealth
Consecrates alms that trumpet forth his wealth.

Cressus for unimagined pleasure pants;
His very pain is that he nothing wants:
His life, a calm so sick'ning to the soul,
Were worse to many than the tempest's howl.
'Tis the pursuit that cheers us; when attain'd,
The object is as speedily disdain'd;
Of wealth unbounded, as in rank the first,
Cressus with fulness of enjoyment's curst.

Cressus, rich child of dulness, lives among
High orators and mighty sons of song:
Admitted to the table of the gods, he's hit,
Like Vulcan, by their frequent shafts of wit.

Strange are the qualities in Man commixt!
Firm in some things, in others how unfixt!
Can that Valerius, whose high worth is seen
In public actions, be in private mean?
Or can Ambrosius point beyond the grave
A hell for sinners, and become a knave?
How the arch-tempter loves within his toils
To catch reluctant dragons—they are spoils.
The same imaginary sorrows vex
Unquiet spirits, the same cares perplex;
Go to the court, what characters are there!
'The same by Pope described, or La Bruyere.

Eugenius daily with unwearied zeal
Resumes his labours for the common weal;
Neglects his fine estate, with study pale
O'erworks his brains, and what does all avail?
'The dullest idler may in public speak
Better than he—our patriot's nerves are weak!

Ascanius, for his trade too honest, dives
Into the depths of policy, and strives
In sabbathless pursuit of fame to be
What never with his nature can agree.
Too good, though train'd up in the statesman's school,
To see through those whom selfish passions rule;
Too sensitive to bear against the blast
Of faction till its rage be overpast.

Each flying shade, each transient light, will throw
Young Flaccus into fits of joy or woe;
The breath of censure, frown of scorn, will shake
His frame until his heart-strings almost break.
If but a feather's weight oppress his nerves,
The mind disjoined from its purpose swerves.

Scarce on his self-raised eminence appear'd
Publius; the haras'd sons of freedom cheer'd.
To him, as to the pillar'd fire that burn'd
At night before the Israelites, they turn'd
Struggling against Tyranny's recurring wave
They heard his voice, all-powerful to save;
(A voice that fulminating o'er Europe shamed
Power from attempting schemes that cunning framed),
With energy renew'd then upwards sprung,
And firmly to their rock of safety clung.
As falls the mighty column in its pride,
Publius had reach'd Ambition's height, and died!
Perish'd a statesman as erect and great
As from its watch-tower e'er o'erlook'd the state."

The concluding portrait of Canning cannot be mistaken: it does honour to the pencil which drew it. A "Swiss Scene" gives us nature as ably painted as character is delineated in the foregoing; and we hasten to select some of its traits:—

"View'd from the terrace'd walks that round me glow,
How beautiful, Mount Blanc, thy heights of snow
Bathed in rose light, reflecting from the sun
A farewell splendour when his course is run!"

"Gaze on yon massive argenty of cloud
Glittering like battlements of opal proud,
Hanging o'er mountain-pyramids,—the mind
Might image worlds of chrysolite behind.
Gaze on the moon, yon globe of mellow light,
Tranquil as Woman's virtue and as bright;
Lo! as she rises all harsh colours melt
Away,—the harmony of love is felt.
Wide valleys, rich in golden harvests, green
Meadows, blue rivers rolling fast between,
Cities with dark gray walls and swelling domes,
Mountains whose sides the deep pine-forest glooms,
All are intensely hush'd; one hue alone
Prevails, one charm o'er all by silence thrown.
Oh! how magnificent even in repose
Is power at morning's dawn or evening's close;
How grand when stars, through boundless depths of sky,
Watch silent!—citadels of light on high."

"And our humanities, are they not found
Mingling with life above, below, around,
From eagle-eyed Ambition danger-proof
That stands on Glory's pinnacle aloof,
Down to smooth serpent-flattery that charms,
With variegated falsehoods, those she harms!"

The distant Alps:—

"Approach the monuments of time that was
And shall be till away the world must pass:
Emblems sublime of wisdom, they appear
Stable as truth, as contemplation clear,
Reposing 'mid the deep serene, a range
Of Nature's mightiest works, defying change.
Rush by their base wild surges of a river
Like generations of mankind for ever.
Gain eminence o'er eminence,—behold
Vast scenes as of a planet strange unroll'd,
Circuitous immensities, where broods
Horror o'er everlasting solitudes,
Pyramidal, high-towering, castle-shaped,
By Art in her gigantic structures aped.
Advance! your eyes no moving objects greet—
A world unpeopled lies beneath your feet;
Interminable glaciers like a heap
Of frozen waves by suns unawaken'd sleep,
Ice-seas, or wildering wastes of ice, the same
For ever—slippery as an after-name!"

'Tis the sublime of desolation! far
Spread wreck of the elements' primeval war,
(How different from the landscapes seen of late,
Gayer than any fancy might create!
Vineyards on vineyards rising in due grades,
Beautiful dells, groves prodigal of shades.)
There saw Sausure a universe deprived
Of life, and felt that he alone survived!
Sails through mid air a solitary cloud,
Like to a spirit seeking its abode
Above the silent, shadowy vale of death:
Such seems the rugged continent beneath.
In all his naked strength there, face to face,
Is Power behold—there man forgets his race!—
There only, for in forest depths may live

Some hermit whose rude hut may shelter give;
Some pilgrim's foot the arid sands may press
Of the inhospitable wilderness.
War-ravaged lands and cities desolate,
Uncultured plains, and wrecks of regal state,
Are still memorials of heroic crime.
The spoiler man, his gawgaws spoil'd by time.
But scarce accessible to chamois wild,
Coeval with past ages, rocks up-pit'd,
Girt with serpentine ice, distinct appar;
Of human action they no thoughts recall.
Where wild goats leap from crag to crag on high,
Turn we to lake-o'ershadowing mountains nigh,
Or jagged or columnar, what a mass!
Frown others, lengthening in their liquid glass.

Towering o'er the magnificent array
Of clouds that stream along their sides mid-way,
Aerial steeps far spread their granite tower,
By forests of luxuriant growth, pine-crowned,
'Tis thus on genius mighty, though untaught,
That Heaven bestows exhaustless wealth of thought.

Peaks, that the spirit of light seems to subdue
Into crystalline shapes of purple haze,
Sky-pointed peaks, on which, at distance kenn'd,
Stars seem like gods sublimely to descend.
Are types of noble souls, that even on earth
Look upward; gifts celestial shew their worth;
Though firm, with light of charity yet graced,
They are above the storms of passion plac'd.

Far, far around, the heaven-raised barriers, grand
As thoughts of freedom, glow. Tell's native land;
Valleys of loveliest aspect they incline,
Like Strength protecting Beauty in repose."

"Chalets that garland-wise wild plants inwreath
Above look down on castles gray beneath.
Small as is human pride, the time-worn tower
Seems among scenes that laugh at human power.
Vast rocks of similar form that round it press
There mock the feudal ruin's littleness.
What a mere toy is chivalry's pomp among
Glories to Nature's empire that belong!"

In the poem entitled "A Good Man's Future Existence," the structure of the verse is peculiar, but the thoughts are noble and philosophical. It opens thus:—

"As heavenly bodies through the ether move
Silently, stormful regions far above,
Thus above passions that around the throng
Gather, the good man moves his course along.
With such a facile energy he goes
Onward, 'tis action, 'tis sublime repose.
He to the stock of human happiness
Brings every day accession, more or less.
As Flora from her pictures urn in May
Throws flowers, Love scatters blessings in his way.
When gone, remembrance of what he has been,
Sweet as perfume from violet banks unseen,
To those his present influence golden'd, gives
A fragrant joy his presence can survive.
Fraught with a solar life, a wider range,
Organic (mind must have a wider range),
Through faith he brightens in a higher sphere,
Serenely beautiful, as star-light here."

Lord Leigh is ardent in the cause of Poland, and speaks of America with a just admiration, while, at the same time, he reclaims against its endurance of slavery:—

"The ornaments of life Columbia wants,
And decorative graces, but she rears
A fabric, though no splendours there enchant
Idolaters of rank, that man reveres;
The aspect of Utility it wears,
Its ever-crescent strength to contemplate
Patriots rejoice, through vista long of years;
And art will bring refinement, to create
Love of the beautiful in minds ambitious hopes elate."

See! a young nation, whose united will
One spirit animates, one heart impels,
While slumber ancient dynasties, or ill
Conceiving dominion till man rebels,
In works ensuring future wealth excels.
Authors, an immaterial class, are prized
No more than monks were in their cluster'd cells;
But schemes, old states dream not are realised,
By Speculation's far-discerning mind devised.

A new earth's verdurous magnificence
Seems from a recent deluge to emerge:
Lakes with a thousand islands gemm'd; immense
Forests, and far along the horizon's verge

Blue mountains cresting like the ocean's surge;
Earth-shaking rush of falls, and roar of flood;
And fell off seam'd by the tornado's scourge;
These bards have sung, in sad or lively mood,
But their auxiliary charms remain yet to be woo'd.

"Meanwhile activity on restless wing
Flies on, inventive industry her guide;
In the new world, of enterprise the spring
Is felt, rolls thither population's tide,
And unprun'd forests perish in their pride:
To-day, a vigorous race push, unappall'd
By danger, mighty labours far and wide;
To-morrow, farms will thrive and cities wall'd,
Where late through herbage rank amphibious monsters
crawld."

And bright-eyed science, like the morning-star,
Illumes the land that liberty hath blest:
Progressing still in knowledge, thousands are
(Labour their pleasure is, their unrest, rest)
Spreading their bloodless triumphs o'er the West;
Millions shall through far-distant valleys be
Of treasures, undeveloped yet, possess:
Colossal empire of the great and free!
Strong is thy youth, who can thy strength adult foresee?

"Democracy, gigantic, fickle power,
Acts on the government by fits and starts,
Repealing by her flat laws an hour
Ago she will'd. What are the counter-arts
By which the state-machine repairs its parts?
It is the home-religion's gentle sway,
That to extravagant spirits peace imparts;
Of institutions new the only stay,
When young equality would break and cast their bonds
away."

Religion, order, law, the triple cord
Of states, self-honouring liberty admires;
She yields, to vindicate her rights, the sword,
But checks her sons' inordinate desires,
And strikes not when caprice her aid requires.
Noble is her ambition to increase
Man's happiness, not kindle raging fires
Of war throughout the world, but arts of peace
To multiply, and mind from thralldom free release."

Without going further into the subjects,
which are treated at greater length than the
limits of our page permit us to illustrate, we
shall conclude this paper with

"The Sauri.

"Multaque nunc etiam existant animalia terra,
Imbribus et calido solis coacta vapore.
Que minas ext miram, it tunc sunt plura coerta,
Et majora nova tellure, auge autem adalto."

Lacertius, lib. v. v. 785.

Ere as it is the world its course begun,
The earth o'erstem'd with children of the sun,
Goliath hordes of a former age,
When a hot temperature was all the rage;
What were the ladies of the temperate zone
Then? Warm as central fire—now cold as stone!
And man, if man existed then I ween,
Had all the fiery particles of Keen,
Or Byron, when a boy, whose name would spread,
Like Talbot's, among 'clouds' or cockneys, dread.
But all is now comparatively cool:
Thank Heaven! we have no Camelfords at school.
Though heat-begotten monsters we encase
In our museums, but kindly raging fies
Whether they were herbivorous, or ate
Dirt like an Otomac, I cannot state.
They thirsted not like monsters since the flood
Begot—the taste is ancient too—for blood!
Perchance, as Waterton a crocodile
Rode, they were ridden, though in length a mile!
'Conjecture here—geologists advance
But sober truths—loves somewhat to romance.
The freeborn Sauri scorn'd a reigning lord,
Half-monkey and half-tiger, beast-abhor'd
That rides, like tailors on their fluttering geese,
A many-headed hydra not with ease.
The steed will throw his rider if press'd sore,
As Spenser's dragon threw the gorgeous w—;
The Lithuanian fretting at the curb
Imperial may his master's seat disturb.
Proud of their igneous origin the tribe
Were self-important as a titled squire;
Shallow as Trinaculo deemed Caliban
Whether through fens they paddled, cropt or ran;
Singing in chorus marshy songs, devouring
Fern salads, like our idlers bored and boring,
They lived—chronologists may guess the time—
And then returned to what they came from—slime.
Ere Alorus they lived; or, to go higher,
Ere lived forefathers of a Cambrian 'squire.
They may, sublimed into another sort
Of beings, through ethereal space transport
Themselves with a rapidity intense;
With tubes provided every tube a sense.
Such Davy saw, or dream'd he saw, at Rome.
Philosophers have sober views at home;
At Rome sublimed their spirits now on fire
Be-lun'd to Aristotle's flights aspire.
Oh were these high-bred monsters now alive
In those famed gardens, where on Sunday drive
Ladies high-born as to a morning rout,
To laugh at apes with tails, and apes without,

Fashion might then revive Egyptian rites,
And in these non-descript discern 'new lights':
Though some plebeian peer, whose pedigree
Would puzzle Heard, might not their merit see:
Pendent from gorgeous ceilings to amaze
The world, their forms in *or-nolu* might blaze
Through grand saloons, where taste capricious links,
Alliance strange,—a griffin with a sphinx!
While pretty women lip, 'You have not seen
The phoscauri! Where could you have been?'
Far more in fashion they than Namick Pasha—
A Brahmin—cornet—or Lord Dudley's *basaw*;
Or novel of the season latest, best.
Yet so severe, it ought to be suppress'd.
Would they were now alive, consuming wheat,
And kept by rich zoologists, to eat!
They, like Napoleon, prices might exalt,
More than remission of the tax on malt:
And landowners would cease to grieve that they
With crippled means increased rent-charges pay.
Soon would they disappear on Erin's bog,
Cherish'd as Isaac Walton cherish'd frogs,
To be impaled by Orange seers, who hope,
To prove that monsters symbolise the pope,
Especially if their long tails emit
A phosphorescent light like—Irish wit!"

Need we repeat, after these examples, that
this volume is one of great variety, power, and
poetry?

Confessions of a Thug. By Captain Meadows
Taylor, in the service of H. H. the Nizam.
3 vols. 12mo. London, 1839. Bentley.

"You have given a faithful portrait of a
Thug's life, his ceremonies, and his acts;
whilst I am proud that the world will know
of the deeds and adventures of Ameer Ali, the
Thug;" are the concluding words of the auto-
biographical narrative which Captain Taylor
has here put into the mouth of one of the
most desperate of that extraordinary combina-
tion of assassins, whose atrocities have only
within the last seven or eight years become
the wonder and horror of India. The history
of mankind affords no parallel to Thug-
gee: the bands of the Old Man of the Moun-
tain scattered over many lands, the Secret
Tribunals of Germany, the Inquisition, were all
petty murderers, when compared with this ter-
rible association. Men have been likened to
tigers, with an aptness that well illustrated
sanguinary character; but the Thugs were
bloodhounds, whose thirst for human gore never
ceased to inflame them with an appetite which
grew indeed with what it fed on, till the de-
struction of life became almost essential to their
own existence. We have been told by military
persons that it was impossible to conceive the
engulfing passion for slaughter which stirred
them to madness in action; and it has been
described to us so vividly as to impart a fearful
sympathy and ardour even to our breasts in
listening to the tale. But the picture of Thug
excitement surpasses aught that could be ima-
gined; and the revelations of actual deeds done
by these remorseless villains, so strikingly em-
bodied by the author under the form of the
confessions of a leader, are enough to freeze
the blood in our veins.

And not the least remarkable part of the
subject is, that these monsters are influenced by
a religious principle in the deliberate strangling
of every victim they can inveigle within their
snare; whilst in the natural affections for
their own parents, wives, brothers, sisters,
children, and friends, they seem to feel the
opposite emotions with equal strength and in-
tensity. Romance could invent nothing so
hideous and contradictory; and were not the
whole system discovered, revealed, and corro-
borated by unquestionable proof, it would be
impossible for the mind to believe that such
things could have been, and, in spite of all the
exertions of European intelligence and power,
could still be.

These matters, however, will appear more

clearly as we pass through this strange work,
which is an authentic relation of those dreadful
massacres brought to light by Colonel Sleemen
and others, and only indebted to Captain Tay-
lor for the interesting shape into which he has
thrown his account of them.

"The tale of crime (he informs us) which
forms the subject of the following pages is,
alas! almost all true: what there is of fiction
has been supplied only to connect the events,
and make the adventures of Ameer Ali as
interesting as the nature of his horrible pro-
fession would permit me. I became ac-
quainted with this person in 1832. He was
one of the approvers or informers who were
sent to the Nizam's territories from Sangor,
and whose appalling disclosures caused an ex-
citement in the country which can never be
forgotten. I have listened to them with fear-
ful interest, such as I can scarcely hope to ex-
cite in the minds of my readers; and I can
only add, in corroboration of the ensuing story,
that, by his own confessions, which were in
every particular confirmed by those of his
brother-informers, and are upon official record,
he had been directly concerned in the murder
of seven hundred and nineteen persons. He
once said to me, 'Ah! sir, if I had not been
in prison twelve years, the number would have
been a thousand!' How the system of Thug-
gee* could have become so prevalent,—remain
unknown to, and unsuspected by, the people of
India, among whom the professors of it were
living in constant association,—must, to the
majority of the English public, who are not
conversant with the peculiar construction of
Oriental society, be a subject of extreme won-
der. It will be difficult to make this under-
stood within my present limits, and yet it is so
necessary that I cannot pass it by. In a vast
continent like India, which, from the earliest
periods, has been portioned out into territories,
the possessions of many princes and chieftains,
each with supreme and irresponsible power in
his own dominions, having a most lax and
inefficient government, and at enmity with, or
jealous of, all his neighbours, it may be con-
ceived that no security could exist for the
traveller upon the principal roads throughout
the continent; no general league was ever
entered into for his security; nor could any
government, however vigorous, or system of
police, however vigilant it might be in one
state, possibly extend to all. When it is also
considered that no public conveyances have
ever existed in India (the want of roads, and
the habits and customs of the natives being
alike opposed to their use); that journeys,
however long, have to be undertaken on foot
or on horseback; that parties, previously un-
known to each other, associate together for
mutual security and companionship; that even
the principal roads (except those constructed
for military purposes by the Company's govern-
ment) are only tracks made by the constant
passage of people over them, often intersecting
forests, jungles, and mountainous and uncultivated
tracts, where there are but few villages
and a scanty population; and that there are
never any habitations between the different
villages, which are often some miles apart,—
it will readily be allowed that every tempta-
tion and opportunity exists for plunderers of
all descriptions to make travellers their prey.
Accordingly freebooters have always existed,
under many denominations, employing various
modes of operation to attain their ends; some

* "The word *Thug* means a deceiver, from the Hindoo
verb *Thugra*, to deceive;—it is pronounced *Tug*, slightly
aspirated."

affecting them by open and violent attacks with weapons; others by petty thefts, and by means of disguises. Beyond all, however, the Thugs have of late years been discovered to be the most numerous, the most united, the most secret in their horrible work, and, consequently, the most dangerous and destructive. Travellers seldom hold any communication with the towns through which they pass, more than for the purchase of the day's provisions: they sometimes enter them, but pitch their tents or lie under the trees which surround them; to gain any intelligence of a person's progress from village to village is therefore almost impossible. The greatest facilities of disguise among thieves and Thugs exist in the endless divisions of the people into tribes, castes, and professions; and remittances to an immense amount are known to be constantly made from one part of the country to another in gold and silver, to save the rate of exchange; jewels also and precious stones are often sent to distant parts, under the charge of persons who purposely assume a mean and wretched appearance, and every one is obliged to carry money upon his person for the daily expenses of travelling. It is also next to impossible to conceal any thing carried, from the unlimited power of search possessed by the officers of customs in the territories of native princes, or to guard against the information their subordinates may supply to Thugs, or robbers of any description. It has been ascertained, by recent investigation, that in every part of India many of the hereditary landholders and the chief officers of villages have had private connexion with Thugs for generations, affording them facilities for murder by allowing their atrocious acts to pass with impunity, and sheltering the offenders when in danger; whilst in return for these services they received portions of their gains, or laid a tax upon their houses, which the Thugs cheerfully paid. To almost every village (and at towns they are in a greater proportion) several hermits, fakcers, and religious mendicants, have attached themselves. The huts and houses of these people, which are outside the walls, and always surrounded by a grove or a garden, have afforded the Thugs places of rendezvous or concealment; while the fakcers, under their sanctimonious garb, have enticed travellers to their gardens by the apparently disinterested offers of shade and good water. The facilities I have enumerated, and hundreds of others which would be almost unintelligible by description, but which are intimately connected with, and grown out of, the habits of the people, have caused Thuggee to be every where spread and practised throughout India."

In the suppression of this bloody enormity it seems that "from 1831 to 1837, inclusive, there were

Added to the above, Captain Reynolds mentioned that, at the time he wrote, upwards of 1800 notorious Thugs were at large in various parts of India, whose names were known; how many besides existed, it is impossible to

conjecture. How enormous, therefore, must have been the destruction of human life and property in India before Thuggee was known to exist, or was only partially checked! How many thousands must annually have perished by the hands of these remorseless assassins! Awful, indeed, is the contemplation; for during the whole of the troublous times of the Mahratta and Pindharee wars their trade flourished; nor was it till 1831 that their wholesale system of murder received any serious check: and after its general discovery, the countless and affecting applications from families to the officers of the departments to endeavour to procure them some knowledge of the places where their missing relatives had been destroyed, that they might have the miserable satisfaction of performing the ceremonies for the dead—shewed how deeply the evil had affected society."

Of the youthful history of Ameer Ali, we need take no further notice than that his father and mother were murdered by Thugs, and he, an infant, saved and adopted by one of their leaders. In due time he was initiated into the mysteries of their cursed profession, and became one of the most daring and successful of their jemadars, or chiefs. In the course of his career he murdered his own sister, without knowing who she was; and his other murders were not less horrible, though he seemed to gloat upon the skill and certainty with which he performed them. Their religious observances in the worship of Bhowanee, the goddess of Destruction; their faith in omens, and other strange circumstances, are already pretty generally known to the public. Like the knights of old, the candidates underwent a sort of novitiate, and were instructed in their future duties. Among the rest, the use of the roomal, or handkerchief, used by the Thugs, then called Bhuttote, in strangling their victims, was taught; and it is surprising how instantaneously it ended life:—

"On the fifth morning (Ameer Ali tells), the handkerchief was put into my hand; and after having been bathed, anointed with sweet-smelling oils, and marked on the forehead with vermilion, as a votary of Bhowanee, I was declared a Bhuttote. 'One thing I forgot,' said the old man laughing, as he gave me the cloth; 'and that was the principal, perhaps. I have not shewn you how to use it, and I have a peculiar knack of my own, which is easily communicated. You will soon learn it.' He took the cloth, tied a large knot at one end, with a piece of silver inserted in it: this he held in his left hand, the plain end being in his right, and about as much space between them as would nearly compass a man's neck: the closed hands had the palms uppermost. 'Now,' said he, 'mark this; and when you throw the cloth from behind, and have got it tight, suddenly turn your knuckles into the neck, giving a sharp wrench to either side that may be most convenient. If done in a masterly manner, instant death ensues.' I took the cloth, and held it as he directed, but it did not please him. 'Give it me back, that I may shew you more exactly on your own neck,' said he. 'Indeed, no,' cried I, laughing; 'you might think I was a traveller, and have me down in an instant, without intending it; but I perfectly understand the method.' 'Then try it on me, Ameer Ali; I shall see by the position of your hands whether you know any thing about it.' I obeyed him; the old man shook his head and laughed. 'That will never do; you could not kill a child in that way,' he said: 'when you feel my hands round your neck you will under-

stand.' So I submitted with as good a grace as I could, though I did not at all like the idea. My blood ran cold through me as I felt his chill, clammy hands about my neck; but he did not hurt me, and I saw where my error had been. I tried it on him as he had shewn me several times, and was declared at last to be perfect. 'Now you only want practice, Ameer Ali,' said he. 'Inshalla! Roop Singh,' I replied, 'we shall have plenty of it. One beginning, and I fear not for the rest. Like a tiger, which, once having tasted human blood, will, if possible, take no other, and runs every risk to get it, so I feel it will be with me.' And it was so. Sahib! I knew myself—I had spoken truly."

Thus accomplished, his first murder is described:—

"It was now generally known to all that I was to have the Sahoukar to myself, and many thronged about me to see how I looked forward to my first trial; every one cheered me, and I must own this gave me great confidence. As the time approached, my soul burned for the work like that of a young and brave soldier to see the first flash of his bright sword in anger. My father enjoyed my demeanour in silent satisfaction; he spoke not, but there was exultation in his eye as he looked fondly upon me, and I felt that I should not disappoint him. The whole band seemed to be impressed particularly with the importance of the present matter, for they collected into groups, and though each man knew exactly what he had to do, and what was appointed for his comrade, yet they seemed to be discussing the whole, till one by one they separated, and each stretched himself out to gain the little rest he could, before the time arrived which would call him into active, nay, deadly strife,—my father and Hoosein too, all except myself. I was sitting outside our slight tent when Roop Singh came to me. 'Baba!' said he as he sat down, 'how feel you? is your heart firm and your blood cool?' 'Both,' said I: 'nothing can change my heart; and feel my hand, is my blood hot?' 'No,' said the old man, taking it in his; 'it is not, nor does it tremble; this is as it should be. I have seen many prepare for their first trial, but never one so coolly and calmly as you do; but this is all in consequence of the blessed Muntrus which have been read over you, and the ceremonies you went through.' 'Perhaps so,' said I; 'but I think I should have been much the same without them.' 'Now, may Bhowanee forgive you, proud boy,' he replied; 'you know not their efficacy; was there ever a prouder being than I was,—a Rajpoot by birth, and one of the purest tribes? Had I not slain wild beasts, or helped to slay them from my childhood? but when a man was shewn me, and the handkerchief alone put into my hands to destroy him with, indeed I trembled; nor was it for a long time that I could be brought to attempt it. But,' continued Roop Singh, 'you have one more ceremony to go through, which on no account must be neglected; go, call your father, Hoosein, and Bhudrinath, that they may be present.' We were all soon assembled, and the Gooroo led the way into an adjoining field. He stopped, and turning to the direction in which we were to proceed, raised his hands in a supplicatory manner, and cried, 'Oh Kallee! Maha Kallee! if the traveller now with us should die by the hand of this thy new votary, vouchsafe us the Thibao!' All of us stood silently; and, wonderful to relate, even at that late hour an ass brayed on the right hand. The Gooroo was overjoyed. 'There!' cried he to the others, 'was there ever so complete an acceptance of

a votary? The omen almost followed the prayer. 'Shookr Alla!' exclaimed my father, 'it is now complete; he will go forth and conquer. There only remains for you to tie the knot.' 'That I will do when we return,' said the Gooroo; and when we reached our encampment, he took my handkerchief, and untying the knot which had been previously made, he retied it, placing a piece of silver in it. Presenting it to me, he said, 'Receive this now sacred weapon; put your trust in it; in the holy name of Kalee, I bid it do your will!' I received it in my right hand, and carefully tucked it into my waistband, that I might not lose it, and that it might be ready for action when required. We remained in conversation for some time, and then threw ourselves on our carpets to snatch a short rest, till one of our men from the village came and told us that the Sahoukar was preparing to move, and had sent him on to warn us. The band were quickly roused and our beasts laden, and we drew up by the side of the road to await his arrival. He was not long in coming, and we all moved on together. The night was beautiful, the road excellent, and we pushed on in high spirits. The booty we were to possess, the tact with which the whole matter had been managed from the first, would mark it as an enterprise of a superior description, one that any one of us would be proud to mention, and which would cause a considerable sensation, not only in the country, but among the numerous bands of Thugs of Hindostan, more especially those we were to rejoin at the conclusion of our season. We had proceeded about two coss, when there was a murmur among the men who led, and one of the scouts was an instant afterwards seen making his way to where we were. My father recognised him as one of those he had sent on. 'Bhilla Manjeh?' [have you cleared the hole?] he eagerly inquired. 'Manjeh!' said the man; 'it is cleared, and it is all ready. See you yon low hills? A streamlet, as I told you, runs from them; and it is a rare bilh that we have made, Jemadar Sahib. You will say we have done well.' 'And how far may it be?' demanded my father. 'About half a coss,' said the man: 'a short distance from hence the road becomes stony, and continues so till you are above the pass—take advantage of it;' and he fell in among the others. The men were silently warned to be at their posts, and each man, or two men, as it was necessary, placed himself close to the one to whom he had been assigned. By designed obstructions in front, the bullocks belonging to the Sahoukar, with their attendants, were brought immediately about the cart in which he rode, and the whole being gathered into one place, were the easier to be secured. The preparations again roused me, and I grasped the handkerchief firmly, thinking every moment that the signal was about to be made; but we still crept on at a slow pace, for the road was narrow and lined by thorny bushes; and the men in front proceeding as slowly as possible, we were kept exactly in our proper place, and expected every moment to reach the spot. As we approached the small hills, the jungle became pretty thick, and appeared doubly so by the moonlight, and we passed many places where I thought the deed might have been done with advantage. But I was wrong, for the Lughaees had selected an admirable one. A man came from the front, whispered a few words to my father, and again went on: this increased my anxiety. We crossed a small hollow, ascended a bank, and below us I saw what I was sure was the place. The banks of the rivulet were high and steep,

covered with thick underwood matted by trailing creepers. A few higher trees nearly met over its bed, in which could be just discerned a small thread of water, looking like a silver snake as the moon's rays fell on it through the dark foliage. A hundred thieves might lie there, thought I; and who could ever know the fate of a traveller who might so easily be surprised in such a spot? I was roused from my train of thought by my father, as he called out 'Hooshiaree!' [caution.] This was the preparatory signal. He went to the side of the cart, and represented to the Sahoukar that we had reached the stream, and that the bank was so steep, and the bed so stony, that we must get out and walk over to the other side, if no further. This was quite sufficient: the man got out, and after seeing the cart safely down the steep bank, was preparing to follow himself. The whole scene is now before me. The bullocks and their drivers, with the Thugs, were all in a confused group in the bed of the little stream, the men shouting and urging on their beasts: but it was easy to see that every man had a Thug close to him awaiting the signal. They were only a few feet below us, and the stream was so narrow that it was with some difficulty all could stand in its bed, especially when the cart reached the bottom. Above, stood my father, Hosenin, and myself—the Sahoukar, one of his servants, and several other Thugs. I was eagerly waiting the signal; I tightly grasped the fatal handkerchief, and my first victim was within a foot of me! I went behind him, as being preferable to one side, and observed one of the other Thugs do the same to a servant. The Sahoukar moved a step or two towards the road; I instinctively followed him—I scarcely felt that I stirred, so intensely was I observing him. 'Jey Kalee!' shouted my father: it was the signal, and I obeyed it! As quick as thought the cloth was round his neck; I seemed endued with superhuman strength—I wrenched his neck round—he struggled convulsively for an instant, and fell. I did not quit my hold; I knelt down on him, and strained the cloth till my hand ached; but he moved not—he was dead! I quitted my hold, and started to my feet: I was mad with excitement!—my blood boiled, and I felt as though I could have strangled a hundred others, so easy, so simple, had the reality been. One turn of my wrists had placed me on an equality with those who had followed the profession for years: I had taken the first place in the enterprise, for I had killed the principal victim! I should receive the praise of the whole band, many of whom I was confident had looked on me as only a child. I was roused from my reverie by my father. 'You have done well,' he said, in a low and kind voice; 'you will receive the reward of this soon; now follow me, we will go to the grave. Ere this the bodies have been collected, and I myself must see that they are properly disposed of. There will be a noise about this business, and it will need great exertion for us to get out of the road we are now travelling.' I followed him. We descended into the bed of the stream, and were led to the grave by one of the men; others, bearing the body of the Sahoukar, followed. We passed up the bed of the stream for a short distance; and near the mouth of a small nulla, the bed of which was dry, a number of the men were standing. 'The grave?' asked my father. 'It is up there,' said one; 'you will have to creep, and the thorns are very bad.' 'It matters not,' he replied; and we entered the place. The banks of the rivulet were perhaps two or three yards high, and the bed was so narrow that

but two persons could advance abreast. The creepers and trees were matted over head, and the sides so thick that it was impossible that any one could have got down from above. The tangled character of the spot increased as we proceeded, until it became necessary to free our clothes from the thorns which caught us at every step. In a few moments we heard the sound of voices; and after creeping almost on all-fours through a hole which had apparently been forced through the underwood, we came upon the grave. There was only one; it occupied almost the entire breadth of the stream; it was very deep, and the earth, or rather sand, had been thrown out on each end. The Lughaees were sitting there, sharpening stakes cut from the jungle; but they could scarcely be seen from the darkness of the place, which the thick wood above only partially allowed the moonbeams to penetrate. They were conversing in a low tone in the slang of the band, which I had not learned: my father spoke to them, or rather to their leader. 'You have had your wits about you,' he said, 'and we will think well of you when we make the distribution: this is a grave that even a jackal could not discover. Again I say, Peer Khan, you have done this properly; and it is well I have seen it, that I may speak of you as you deserve: but you must be quick—the night advances.' 'It is finished, Khodawund,' replied the man; 'we do but wait for another body which they say is coming, and the filling up will be done immediately.' As he spoke, the body of the Sahoukar was brought up by three men, who railed at it for its weight. 'It is their wont,' he said; 'do not speak to them; only watch what they do; for you must see all, that you may be fully acquainted with your duties.' I was silent. The corpse was dragged to the brink and thrown in, as also that of the servant, who had been killed close to the Sahoukar: incisions were made in their abdomens, and sharpened stakes driven through them. 'Were it not for the precaution you see,' said my father, 'the ground might swell, and the jackals would drag out the bodies; in this way, however, it is impossible.' When all was finished, quantities of stones which had been collected were thrown upon the bodies, afterwards thorns, and the whole was covered up with sand, which was carefully smoothed. 'I think this will do, Jamadar Sahib,' said Peer Khan; 'we may now leave the place. It is not likely that any one will come here to look for the Sethjee or his people, and the Sahibzada has seen how cleverly we have done our work.' 'Enough,' said I; 'I shall know how to act as a Lughia myself should I ever need it.' My father beckoned me to follow him. I stayed to see some dry sand thrown over the place, and proceeded with the others. The hole in the underwood made by us was closed up with great care; and a branch of a bush being broken off, and trailed after him by the hindmost man, obliterated every footmark in the dry sand of the Nulla.

Similar in the main points are most of the stories of murder; but sometimes the victims were strong and armed men; at other times numerous, and accompanied by women who were well guarded; and these make the varieties of the adventures and dangers of the Thug. On other occasions such as love-affairs, &c., the sketches of Oriental manners, customs, and society, are alone a high recommendation to this publication. We know not when we have seen them better depicted. Here, for instance, is a portrait:—

"Bhugrinath, one of the most skilful of the

band, was a complete exception to what I have said. He was a short, stout, active fellow; a man who aspired to be a jemadar, and with some reason. I have mentioned him before as the bearer of the sacred pickaxe. He was one of the most enterprising among us, and had conducted small expeditions, in which he had acquitted himself much to the satisfaction of those who had intrusted him with them. It was curious to see that man eat. He consumed, every day that he could get it, two seers of flour made into cakes, a quarter of a seer of ghee (clarified butter), and a large pot of milk containing upwards of a seer. It seemed impossible that one man could demolish the pile of cakes when he had baked them, and fairly sat down to eat them; but one by one they disappeared, accompanied by such draughts of water as would alone have filled any ordinary person. Towards the end of the pile, however, it was easy to see that his jaws could hardly perform their office, and it was almost painful to behold the distension of his stomach: he would stretch himself first on one side, then on the other; get up and stroke down the mass collected, apparently from his throat downwards, and again essay to finish what remained, and after many attempts he would sometimes succeed. Often have I seen two or more village dogs sit opposite to him, during the consumption of the mountain of cakes, looking wistfully at it, in the hope that a portion of each as he ate it might be thrown to them, watching and envying every mouthful as it passed into the apparently insatiable maw: but in vain! Sometimes Bhudrinath would divide the last two or three cakes between them, when every means of eating more had been tried and had failed; but it was oftener that desire of eating predominated. He would appear on the point of gratifying the dogs' expectations,—nay, would even break a piece off and hold it in his hand as if offering it: the dog would move towards him, but the coveted morsel disappeared as the rest had done, and he would return to his expectant station, to resume a watch which too often ended in disappointment. We often jeered him on his enormous consumption of food; but he used to declare that nothing under the daily allowance I have mentioned could satisfy him, or enable him to perform his duty."

An Eastern entertainment offers the next example. The actors are called Bhyroopeas.

"They were three in number; and twisting their faces into comical expressions, so as to cause the whole assembly to burst into a simultaneous fit of laughter, one of them stepped forward and said, that in the country whence he came there was once a nuwab, a very wise man, who governed his country as no one had done before, and was a lord victorious in war; and that, if the hoosoor pleased, his slaves were prepared to relate some of his adventures.—'Go on,' said the nuwab, 'we are attending; see that there is nothing indecent, for you are in the presence of the khamun.'—'Astefaralla! [God forbid!] cried all, making their salutation towards the screen; 'may the favour of the khamun be upon us, and may Alla give her a long life and posterity to bless her. Inshallah! we shall find favour in her sight, and take away our garments filled with gold.'—'They commenced: one of the men, dressed ridiculously as a child, personated the nuwab. The story begins with his youth, how he is petted in the zenana; and the two others changing their dresses to those of females, one is his mother, the other his nurse. The young nuwab is pampered, spoiled, becomes unruly,

is declared to be possessed by the Shitan; a moolah is called in, and charms and wonderful potions, prepared by the aid of magic, are administered. The great child screams and roars, kicks his mother and nurse out of the assembly, upsets all about him; and the confusion and noise created by all this, especially among the tuwaifs, made a scene of fun at which we all laughed heartily. In an incredibly short time the men again made their appearance, and the second act began. The child had grown up to be a youth, and to be fiery and uncontrollable. Women, wine, horses, and arms, are his enjoyments: reckless of every thing, he plunges into dissipation, sets his parents at defiance, runs into debt, is surrounded by sharpers and parasites, who despoil him of all he possesses; and he has given himself up to harlots and debauchery: and this ends the second part.—His father dies—he is now nuwab; he is the head of a proud house, has men and soldiers at his command, and his territory to manage. He forthwith kicks out his former companions, discards every one he had formerly had near him, good and bad together, and gives himself up to a new set of rogues who had preyed upon his father—men with hoary beards, only the greater adepts in villany. He has a quarrel with a neighbouring noble, and the two prepare for war. The troops are described: how they eat mountains and drink rivers; and the nuwab himself as going forth like a bridegroom to meet his bride, like the lightning from the thunder-cloud, or a river overrunning its bounds, terrible, irresistible, before whose glance men quail as before a lion! His horse and arms,—the former large of carcass, small of limb, feet large and broad, fleet as the antelope, courageous as the panther. Of the arms, the sword which, wielded by his father, had cut through a buffalo's skin and divided the thickest quilting. He goes forth, and the fight commences; the horse charge, and the nuwab and his enemy meet (each is mounted on the back of a man). They fight; sword after sword (made of wood) is splintered. One of the horses is killed; it is the nuwab's! He too is killed! he is at the mercy of his foe! No, he is up again; the fight is renewed; it is long doubtful; fresh weapons are given by attendants; at last he is victorious. Alla Akbar! the victory is won, the enemy is routed. Then follows the torture of the prisoners, the rifling of the zenana. There is one slave beautiful, small, delicate in form, an eye like the gazelle's, fair as the beauties of Rome or the fabled ones of England. She falls at his feet: he is captivated. She conquers, and the nika is performed. They live happily for some time; but the fame of the beauty of the daughter of a neighbour reaches him. His soul is on fire; his former love is neglected. He proposes marriage; it is accepted; the bride comes home, and a deadly jealousy ensues between the rival wives. The quarrels of the zenana are described; and by the shrieks of laughter from behind the screen, it was easy to believe how naturally all had been described and acted. The nuwab has reached middle age; he is now a father of a family, a respectable man, a religious man, surrounded by moolahs, who flatter him, and have usurped the places of his former companions. He is as debauched as ever; but it is not known; he passes for a just and good man, and his durbar is described, and his judgments. What was Solomon compared with him? or Hatim Tai, or Lokman the wise? And at each enumeration of his virtues the assembly loudly applauded, and directed their looks to the real nuwab who sat as the spec-

tator. Again the nuwab is shewn, old and decrepid, worn out by disease, surrounded by quacks, from whom he demands nostrums to make him young and vigorous. His zenana is fuller than ever of women, who flatter his vanity, tell him he is as young as ever he was, and yet are false to him; but he has a son who promises to excel his father, who is a Mejnoon in form, a Roostum in valour, before whom his father's enemies are scattered like chaff from the grain before the wind. The old nuwab is growing more and more decrepid and querulous. His fancies and longings are described in a most laughable manner; and, as the final event approaches, he sinks into his eternal sleep, sure of the seventy hours of Paradise, and the eternal youth, which is the portion of true believers. Having concluded, they stepped forward for the largess promised. 'Well, Meer Sahib,' said the nuwab to me, 'how like you this? have the men done ill or well?' 'Ul-humd-ul-illa!' said I; 'the works of Alla are wonderful, and assuredly these fellows are of his especial handiwork. I have seen many of their caste before, but never any like these.' 'They shall be well rewarded,' said the nuwab; 'and yet despite of our having laughed at the whole story, there is much of a moral in it, and much satire. Would that many of the rising generation could receive a lesson from it; they might become wiser and better men.' 'Ameen,' I replied; 'my lord's remarks are just. I did not notice the satire when I heard it; but now I feel it, and it is just.'"

The execution of a robber is another picture of the barbarity of these savages:—

"The mangs (hangmen) looked to me for orders, and I told them to proceed: it was clearly of no use to delay. The robber was again tightly pinioned and thrown on the ground, and the mang who held the knife he had been sharpening, dexterously cut both sinews of his legs close above the heel; he was then raised up, the noose put round his neck, and in another instant he was pulled up to the branch and struggling in his death agony. 'Pah!' said Bhudrinath, turning away, 'it makes me sick: what a contrast this is to our work, where he who is to die scarcely knows that the handkerchief is about his neck before he is a dead man!' 'You say truly,' said I; 'we have the advantage; but these mangs are miserable, outcast wretches.'"

Another Thug massacre is marked by peculiar and striking circumstances. They had strangled the devoted party, and their bodies were yet lying on the sand when—

"Two travellers were seen approaching, and the bodies were hastily covered with sheets, as if those who lay beneath them were asleep; and I cried to the men for some of them to sit and others to lie down, and all to feign great weariness. They did so, and the men came up; they were poor creatures, hardly worth killing, and I proposed to Peer Khan to let them go, but he would not hear of it. 'Let them go!' he cried; 'are you mad? Do you not think that these fellows already suspect who we are? Does a man ever come into the presence of the dead, he they ever so well covered or disguised, without a feeling that they are dead? and see, some of our men are speaking to them; they are true bunij, and Davee has sent them.' 'As you will,' said I; 'but there may be more of them.' 'Hardly so soon,' replied he; 'these fellows must have left in the night to be here so early: but come, let us ask them.' And we walked up to them. 'Salam!' said I; 'where are you from so

early? you have travelled fast if you have come from the stage we hope to reach in the course of the day; how far is it?" "It is seven long coss," said the man; "and the sun will be high and hot before you reach it; but we are in haste and must proceed." "Stay," said I; "dare not to move till you are allowed; and tell me, how many travellers put up last night in the village from whence you have come?" "Two besides ourselves," replied the other of the two, evidently in alarm at my question. "Why do you ask?" "Are you sure there were no more?" "Certain," he replied; "we travelled together from Jubbulpore, and put up in the same house." "And how far are they behind you?" "They will be here immediately, I should think, for we started at the same time but have outstript them." "Good," said I; "now sit down there and wait till they come." "Why is this?" cried both; "by what right do you detain travellers? we will go on." "Dare to stir at your peril," said I; "you have intruded on us, and must pay the penalty." "What penalty? are you thieves? if so, take what you will from us and let us go." "We are not thieves," said Peer Khan; "but stay quiet, we are worse." "Worse! then, brother, we are lost," cried one to the other; "these villains are Thugs; it is even as I whispered to you when you must needs stop among them; they have been at their horrid work, and yonder lie those whom they have destroyed." "Yes," said I, "unhappy men, you have guessed tight; yonder lie the dead, and you will soon be numbered with them; it is useless to strive against your destiny." I turned away, for I felt, Sahib—I felt sick at the thoughts of destroying these inoffensive people. They might have passed on—but Peer Khan was right; they had detected the dead, though the bodies had been laid out and covered as if the senseless forms were sleeping—but they lay like lumps of clay. No measured breathing disturbed the folds of the sheets which covered them; and a glance had been sufficient to tell the tale to the unfortunate people who had seen them. But I shook off the feeling as best I could; had I given way to it, or betrayed its existence to my associates, the power I possessed over them would have been lost—and it was the spirit of my existence. "They must die," said I to Peer Khan; "you were right, and they had guessed the truth; but I wish it had been otherwise, and the lazy Lughaees had done their work quickly; they might have passed on, and we have had a good morning's work without them; they are not worth having." "I would not exchange places with them for any thing you could name, Meer Sahib; and perhaps it were well to put them out of their suspense." "Do so, Peer Khan, and get the rest with them removed; I will deal with one of the other two coming up. These fellows are half dead already with fear, and the others I will fall on in my own way; I hate such passive victims as these will be." Peer Khan and another went to the miserable wretches, who remained sitting on the ground where we had left them. I watched them; they stood up mechanically when they were ordered to do so, and stretched out their necks for the fatal roomal, and were slain as unresistingly as sheep beneath the knife of the butcher. The rest of the travellers were not long coming, and were only two, as the others had said. "Now," said I to Motee, "these fellows must be dealt with at once: you take one, I will the other; they must not utter a word." "I am ready," said he; and we arose and lounged about the road.

The travellers came up. One was a young and the other an old man. I marked the young one, and as he passed me a Thug laid hold of his arm; he turned round to resent it, and I was ready. These, too, were carried away; and, after collecting our dispersed party, we once more pursued our route without interruption. It had been a good morning's work."

At one period, Ameer Ali and his Thugs joined a Pindaree force, and witnessed acts more diabolical than their own. Ghuffoor Khan, one of the Pindaree commanders, in the sacking of a town, furnishes the following appalling story:—

"Ghuffoor Khan was busy too. I had completed my work; I had torn ornaments from the females, terrified their husbands and fathers into giving up their small hoards of money; and having got all I could, I was preparing to leave the town in company with my Thugs, who never separated from me. We were passing through the main street on our return, when our attention was attracted to a good-looking house, from which issued the most piercing screams of terror and agony. I instantly dismounted, and bidding my men follow me, we rushed into the house. Never shall I forget the scene which met my eyes, which [when] we reached the place from whence the screams proceeded. There was Ghuffoor Khan, with seven or eight of his men, engaged in a horrid work. Three dead bodies lay on the floor weltering in their blood, which poured from the still warm corpses. Two were fine young men, the other an elderly woman. Before Ghuffoor Khan stood a venerable man, suffering under the torture of having a horse's nose-bag full of hot ashes tied over his mouth, while one of the khan's followers struck him incessantly on the back with the hilt of his sword. The miserable wretch was half choked, and it was beyond his power to have uttered a word in reply to the interrogations which were thundered in his ear by the khan himself as to where his treasure was concealed. Three young women, of great beauty, were engaged in a fruitless scuffle with the others of Ghuffoor Khan's party; and their disordered appearance and heart-rending shrieks too well told what had been their fate previous to my entrance. What could I do? I dared not openly have attacked the khan, though I half drew my sword from its scabbard, and would have rushed on him; but he was my superior, and had I then put him and his men to death, it could not have been concealed from Cheetoo, and what would have been my fate? So checking the momentary impulse, which I had so nearly followed, I approached him, and endeavoured to withdraw his attention from the horrible work in which he was engaged. 'Come, Khan Sahib,' I cried, 'near us is a house which has resisted my utmost efforts to enter: I want you to aid me, and, Inshalla! it will repay the trouble, for I have heard that it is full of money and jewels, as the family is rich.' I did not tell a lie, for I had endeavoured to break open the gate of a large house, but desisted when I was informed that it was uninhabited. 'Wait awhile,' said he; 'I have had rare sport here; these fools must needs oppose our entrance with drawn weapons, and I got a scratch on the arm from one of them myself. But what could they do—the kafirs! against a true believer? They fell in this room, and their old mother too, by my own sword. My men have been amusing themselves with their wives; whilst I, you see, am trying to get what I can out of this

obstinate old villain; but he will not listen to reason, and I have been obliged to make him taste hot ashes.' 'Perhaps he has naught to give,' said I; 'at any rate, he cannot speak while that bag is over his mouth; let it be removed, and we will hear what he has to say.' 'Try it,' said the khan; 'but we shall make nothing of him you will see.' 'Remove the bag,' cried I to the Pindharee, who was behind him; 'let him speak; and bring some water; his throat is full of ashes.' The bag was removed, and a vessel full of water, which was in a corner of the room, was brought and put to his lips; but he rejected it with loathing, for he was a Hindoo and a Brahmin. 'Drink!' cried the infuriated khan, at beholding his gesture; 'drink, or, by Alla, I will force it down thy throat! Kafir, to whom the urine of a cow is a delicacy, darest thou refuse water from the hands of a Moslem?' 'Blood-thirsty devil!' said the old man, in a husky voice, 'water from thy hands, or any of thy accursed race, would poison me! I would rather drink my own sons' blood, which is flowing yonder, than such pollution!' 'Ha! sayest thou so? then, in the name of the blessed Prophet, thou shalt taste it! Here, Sumund Khan, get some up from the floor; yonder is a cup—fill it to the brim; the old man shall drink it, as he would the wine of Paradise!' 'Hold!' cried I to Ghuffoor Khan; 'you would not do so inhuman an act?' 'Nay, interfere not,' said the khan, setting his teeth; 'you and I, Meer Sahib, are friends—let us remain so; but we shall quarrel if I am hindered in my purpose; and has he not said he preferred it to pure water?' Sumund Khan had collected the blood, and the cup was half filled with the warm red liquid—a horrible draught, which he now presented to the miserable father. 'Drink!' said he, offering the cup with a mock polite gesture; 'think it Ganges water, and it will open thy heart to tell us where thy treasures are.' Ghuffoor Khan laughed loudly. 'By Alla! thou hast a rare wit, Sumund Khan; the idea should be written in a book: I will tell Cheetoo of it.' But the old man turned from them with loathing, and his chest heaved as though he were about to be sick. 'There is no use wasting time,' cried Ghuffoor Khan; 'open his mouth with your dagger, and pour the draught into it!' It was done; by Alla! Sahib, the two did it before my eyes,—fends that they were! Not only did they pour the blood down the old man's throat, but in forcing open his mouth they cut his lips in a ghastly manner, and his cheek was laid open. 'Now tell us where the gold is!' cried Ghuffoor Khan. 'Of what use is this obstinacy? Knowest thou not that thy life is in my power, and that one blow of my sword will send thee to Jehanum, where those fools are gone before thee?'—and he pointed to the dead. 'Strike!' cried the sufferer,—'strike! your blow will be welcome; I am old, and fit for death. Why do ye delay?' 'But the gold,—the treasures!' roared the khan, stamping on the ground. 'Why, are you a fool?' 'Gold, I have told ye, I have none,' he replied; 'I told you so at first, but ye would not listen. We gave you all we had, and ye were not satisfied. Ye have murdered my sons and my wife, and dishonoured my daughters. Kill us all, and we will be thankful.' 'Hear him!' cried the khan savagely; 'he mocks us. O the wilful wickedness of age!—is it not proverbial? One of you bring some oil and a light; we will see whether this humour can stand my final test, which has never yet failed.' By this time the house was full of Pindharees, and, if I had

wished it, I had not dared to interfere further. I stood looking on, determined to let him have his course; he was only hastening his own fate, and why should I prevent it? The oil was brought, and a quantity of rage were torn from the dhotees, or waist-cloths, of the murdered men. They were dipped in the oil, and wound round the fingers of the old man to as great a thickness as was possible. 'Now bring a light,' cried the khan, 'and hold him fast.' A light was kindled, and the man held it in his hand. 'I give you a last chance,' said the khan, speaking from between his closed teeth; 'you know, I dare say, the use your fingers will be put to; be quick and answer, or I will make torches of them, and they shall light me to your treasures, which I warrant are hidden in some dark hole.' 'Do your worst!' answered the old man, in a desperate tone. 'Ye will not kill me; and if my sufferings will in any way gratify you, even let it be so; for Narayun has given me into your power, and it is his will and not yours which does this. You will not hear me cry out though my arms were burnt off to the sockets—I spit at you!'—'Light the rags!' roared Ghuffoor Khan; 'this is not to be endured.' They were lit—one by one they blazed up, while his hands were forcibly held down to his sides to accelerate the effect of the fire. Alla, Alla! it was a sickening sight. The warm flesh of the fingers hissed under the blaze of the oiled rags, which were fed from time to time with fresh oil, as men pour it upon a torch. The old man had overrated his strength. What nerves could bear such exquisite torture? His shrieks were piteous, and would have melted a heart of stone; but Ghuffoor Khan heeded them not: he stood glutting his savage soul with the sufferings of the wretched creature before him, and asking him from time to time, with the grin of the devil, whether he would disclose his treasures. But the person he addressed was speechless, and after nature was fairly exhausted he sunk down in utter insensibility. 'You have killed him,' I exclaimed. 'For the love of Alla, let him alone, and let us depart; what more would you have? either he has no money, or he will not give it up.'—'Where be those daughters of a defiled mother?' cried he to his followers, not heeding what I said to him. 'Where are they? Bring them forward, that I may ask them about the money, for money there must be.' But they too were dead! ay, they had been murdered also; by whom I know not, but their bodies were found in the next room weltering in their blood. The news was brought to the khan, and he was more savage than ever; he gnashed his teeth like a wild beast; he was fearful to look on. The old man had revived, for water had been poured on his face and on his fingers; he raised himself up, looked wildly about him, and then gazed piteously on his mutilated hands. Were they men or devils by whom he was surrounded? By Alla! Sahib, they were not men, for they laughed at him and his almost unconscious actions. 'Speak!' cried the khan, striking him with his sword, 'speak, kafir! or more tortures are in store for thee.' But he spoke not—he was more than half-dead: misery and torture had done their utmost. The khan drew his sword. Again he cried, 'Speak!' as he raised the weapon above his head. I fancied I saw the old man's lips smile, and move as though he would have spoken: he cast his eyes upwards, but no word escaped him. The sword was quivering over his head in the nervous grasp of the khan; and seeing he got no answer, it descended with its full force on the

old man's forehead, almost dividing the head in two. Need I say he was instantly dead? I was satisfied; Ghuffoor Khan's cup too was full; for my own determination was made on that spot.—I swore it to myself as I looked at the dead and rushed from the house."

And if ever Thug did a righteous deed, it was in the strangling of this monster. But we have not room to tell of his justifiable end; nor any other of the incredible incidents with which these volumes abound. They are altogether so curious, that even the revolting nature of the system which they unfold, in all its details, cannot keep them from general circulation; and indeed, as a theme on which to try the profoundest speculations upon the being MAN, their revelations are unequalled by all we have ever read of cruelty and butchery.

Three Months in the North; including Excursions in Tellemark and Ringerike: with an Itinerary. By George Downes, M.A. &c. 12mo. pp. circ. 160. Edinburgh, 1839. Blackwoods; London, Cadell; Dublin, Cumming.

MR. DOWNES has held the pen of a various writer for some twenty years. His translations from Sophocles, poetry, travels, guides, and other productions, have from time to time come before us, and been noticed as they deserved. The present small volume is, as far as it goes, a useful addition to the late tours in the North with which the public has been favoured by several authors; and in the Appendix are illustrations of northern literature and antiquities, which give an interest to these branches of pleasing inquiry. An extract relating to the excursion from Christiania into Tellemark will serve to shew the character of the work, and the wild and primitive nature of the country and its inhabitants:—

"Towards midnight we emerged from the forest, and I dimly discerned a group of cottages. This was Bolkesjoe, a farm where we were to abide for the night. Under the guidance of Dame B. we entered a substantial wooden building, two stories high. On ascending the stairs I found myself in a corridor tenanted by a *carriole*, one of those small light vehicles so common in Norway, which are the very reverse of our *sociables*, being intended for one person alone. My chamber breathed of primitive times. At one side were two beds, or rather square wooden cribs, and the walls were full of pious inscriptions, among which was one over the beds importing:—

'True fear of God, the seed of virtuous acts,
Guides you to all that God or law exacts.'

I rose early to survey the premises. On stepping out I found myself in a field, in which were above a dozen buildings, formed of solid trunks of trees, and resembling rather a hamlet than a solitary farm. The principal one was the dwelling-house—a distinct building from the inn, of which we were the sole occupants—another a repository for wood, another a car-house. In a kind of oblong trough, on the slope of a hillock, grew a few tufts of grain, and wisps of vegetables. The scene around was of a stunted Alpine character. On the west rose the Gousta, the highest mountain in the south of Norway; and below the farm extended a lake, into which ran a pine-covered headland, a prolongation of our midnight forest. We were now in Upper Tellemark—the boundary between the government of Bratsberg, to which it belongs, and that of Buskerude, in which Kongsberg is situated, lying between this and Møen. As I issued from my nocturnal abode Dame B. issued from hers,

and shortly after Gulich, the *gudeman* himself, appeared in a green jacket and brown breeches, both highly embroidered. He is a substantial farmer, is considered to be an intelligent and courteous man, and has even sat in the *Storting*, or Norwegian parliament. Our breakfast-room contained his library, consisting of a few shelves of theology and law—meet studies for the man and the senator. Among the profane works was a Danish translation of Jouy's 'Morals applied to Politics.' This wigwam was a complete academy of inscriptions. On a drinking-bowl was one importing:—

'The ale, in sooth, is good to drink,
But many have no cash to chink.'

"A long day's journey intervened between Møen and Kongsberg, distant seven Norwegian miles and three-quarters. This journey afforded us no favourable specimen of Norwegian posting. The first station was Stjernæs. Here, and at the second, Rodstæt, we had to wait a long time for horses, which are furnished by the peasants, as there are no regular post-horses on the roads in Norway. At the third station, Giellerud, a girl, sent in quest of a relay, soon returned. However, there was no appearance of a carriage; and I was marvelling how we should get on, when I observed an old man with a plank and saw in his hands descending towards the road, and it instantly struck me that he was going to *build one*. I was quite right. On the road I had noticed a common cart, which had already caused me some misgivings. On this the old innovator nailed a piece of the plank, by way of a seat, while a sack of chaff supplied the cushion. I entered my protest against this proceeding in the post-regulation-book; but I afterwards heard at Kongsberg that the postmasters are not bound to furnish carriages at all, though the charge for carriages is defined by law as well as that for horses. At Svenesund, the post-station next to Kongsberg, there was an auction, which appeared to have called all the resources of the rural wardrobe into play. Young Norwegian dandies were strutting about with all the pride which a consciousness of buttons and embroidery could inspire; and many a Norwegian dandinette felt exalted at the idea that one day the whole concern would be hers—dandy, buttons, and all! On appearance, of course, gave no inconsiderable zest to the entertainment; few English travellers, I believe, ever passing this way. The peasants—many of whom, to judge from the number of horses, had come from a distance—were very civil, and made way for me as I approached to gratify the whim of buying some article. I listened to the numerals discharged from the mouths of the bystanders; and, when satisfied that there was no danger of my confounding the terminations *teen* and *ty*, I successfully bid for a couple of handkerchiefs, enhancing the price by some fraction of a penny, paid the king's duty, and carried them off in triumph."

Letters from Germany and Belgium. By an Autumn Tourist. 12mo. pp. 232. London, 1839. Simpkin, Marshall, and Co.

THE preface to this agreeable little volume offers the common apology, that the Letters were "intended chiefly to gratify personal friends," and make "no pretensions to the character of finished productions, such as the public usually look for," which is rather too much in the way of crying stale fish; for if not fit for the public, works ought not to be published. Well, we will attribute the excuse to modesty; but, as the larger portion of the contents has

already appeared in monthly periodicals, we are, by our system, prohibited from the usual illustrations; which would be repetitions of familiar things. We can truly say, however, that from Hamburg to Berlin, Leipzig, Dresden, Toeplitz, Prague, Vienna, Lintz, Munich, Augsburg, Stuttgart, Frankfurt, Mayence, Brussels, &c. &c., the country, and the places themselves are briefly but cleverly described; and that for travellers pursuing this route, or any part of it, the book will be found to be both very convenient and useful. We transcribe a few lines at hazard:—

"Continental travelling embraces so great a variety of pleasures, commencing with activity and change of air for the benefit of health; and offering an everchanging field for observation and reflection, that it would perhaps be difficult to conceive any more delightful combination of terrestrial enjoyments. It is therefore scarcely to be wondered at that, from a refined and wealthy nation such as England, nearly 150,000 roamers are generally to be found—scattered through the various states of the Continent; to whom travelling yields health and recreation abundantly, as well as a certain measure of acquaintance with the leading characteristics of other people. Another of its advantages, and perhaps not the least wonderful, is the impression it produces on the mind, by causing time to be viewed through such a varied and magnifying medium as to create an apparent increase of existence; for three months, well employed in this manner, actually appear, when viewed retrospectively, as lengthened out into several times their natural extent. So much having been seen, felt, admired, and learned, in a brief period, one feels strongly disposed to doubt the possibility of such a concentration of impressions; thus confirming a theory with which you are no doubt familiar, that the mind naturally estimates time chiefly by the number or succession of ideas and events. There is, however, another view to be taken of continental travelling, which it is not altogether so agreeable for one's patriotism to remember; and that is the inconceivable amount of money thus scattered abroad, which, if distributed at home, would tend to the relief of distress, and to the improvement, in a thousand different ways, of our own country and our own people. The national loss thus sustained is, perhaps, not generally estimated at its full amount; for reckoning the medium number of English residents and travellers abroad at 125,000, which is the usual calculation, and taking 150*l.* as the average expenditure of each, it will amount to the enormous sum of above eighteen millions and a half sterling annually."

Hallam's Introduction to the Literature of Europe.

[Second notice.]

WE continue, according to promise, our review of Mr. Hallam's book.

When we talk of the Elizabethan style, or the Elizabethan period of literature, we use an expression which is not altogether correct; for the forty-four years of Elizabeth's reign embraced more than one period and style both in poetry and in prose. The literature of the earlier years of this reign exhibits much of the simplicity of the older popular literature, but it is rather *mediocre*; in the middle of the reign, the taste for learning and foreign languages mixed with the peculiar character of the court of the virgin queen, produced a style that was full of pedantry and far-fetched conceits; whilst in the latter years of this century we have the first examples of that pure and nervous style

which characterised so many of the writers of the following age. In illustration of what we have just said, we need only observe that the celebrated play of "Gammer Gurton's Needle" was written in the earlier years, and that some of the best pieces of Shakspeare appeared in the latter years, of the reign of Queen Elizabeth.

The first who broke through the dullness of the earlier period was Sackville, who wrote the "Induction to the Mirrour of Magistrates." We will begin with Hallam's account of this poem:—

"Sackville's 'Induction' forms a link which unites the school of Chaucer and Lydgate to the 'Faery Queen.' It would certainly be vain to look in Chaucer, wherever Chaucer is original, for the grand creations of Sackville's fancy; yet we should never find any one who would rate Sackville above Chaucer. The strength of an eagle is not to be measured only by the height of his place, but by the time that he continues on the wing. Sackville's 'Induction' consists of a few hundred lines; and even in these there is a monotony of gloom and sorrow, which prevents us from wishing it to be longer. It is truly styled, by Campbell, 'a landscape on which the sun never shines.' Chaucer is various, flexible, and observant of all things in outward nature, or in the heart of man. But Sackville is far above the frigid elegance of Surrey; and, in the first days of the virgin reign, is the herald of that splendour in which it was to close. English poetry was not speedily animated by the example of Sackville. His genius stands absolutely alone in the age to which, as a poet, he belongs. Not that there was any deficiency in the number of versifiers; the Muses were honoured by the frequency, if not by the dignity, of their worshippers. A different sentence will be found in some books; and it has become common to elevate the Elizabethan age in one indiscriminating panegyric. For wise counsellors, indeed, and acute politicians, we could not perhaps extol one part of that famous reign at the expense of another. Cecil and Bacon, Walsingham, Smith, and Sadler, belong to the earlier days of the queen. But in a literary point of view, the contrast is great between the first and second moiety of her four-and-forty years. We have seen this already in other subjects than poetry; and in that we may appeal to such parts of the 'Mirrour of Magistrates' as are not written by Sackville, to the writings of Churchyard, or to those of Gouge and Turberville. These writers scarcely venture to leave the ground, or wander in the fields of fancy. They even abstain from the ordinary commonplaces of verse, as if afraid that the reader should distrust or misinterpret their images."

We think Mr. Hallam's criticism on the pastoral poetry of Spenser extremely judicious:—

"An epoch was made, if we may draw an inference from the language of contemporaries, by the publication of Spenser's 'Shepherd's Kalendar,' in 1579. His primary idea, that of adapting a pastoral to every month of the year, was pleasing and original, though he has frequently neglected to observe the season, even when it was most abundant in appropriate imagery. But his 'Kalendar' is, in another respect, original, at least when compared with the pastoral writings of that age. This species of composition had become so much the favourite of courts, that no language was thought to suit it but that of courtiers; which, with all its false beauties of thought and expression, was transferred to the mouths of shepherds. A striking instance of this had lately been

shewn in the 'Aminta;' and it was a proof of Spenser's judgment, as well as genius, that he struck out a new line of pastoral, far more natural, and therefore more pleasing, so far as imitation of nature is the source of poetical pleasure, instead of vieing, in our more harsh and uncultivated language, with the consummate elegance of Tasso. It must be admitted, however, that he fell too much into the opposite extreme, and gave a Doric rudeness to his dialogue, which is a little repulsive to our taste. The dialect of Theocritus is musical to our ears, and free from vulgarity; praises which we cannot bestow on the uncouth provincial rusticity of Spenser. He has been less justly censured on another account, for intermingling allusions to the political history and religious differences of his own times; and an ingenious critic has asserted that the description of the grand and beautiful objects of nature, with well-selected scenes of rural life, real but not coarse, constitute the only proper materials of pastoral poetry. These limitations, however, seem little conformable to the practice or the taste of mankind; and if Spenser has erred in the allegorical part of his pastorals, he has done so in company with most of those who have tuned the shepherd's pipe. Several of Virgil's 'Eclogues,' and certainly the best, have a meaning beyond the simple songs of the hamlet; and it was notorious that the Portuguese and Spanish pastoral romances, so popular in Spenser's age, teemed with delineations of real character, and sometimes were the mirrors of real story. In fact, mere pastoral must soon become insipid, unless it borrows something from active life or elevated philosophy. The most interesting parts of the 'Shepherd's Kalendar' are of this description; for Spenser has not displayed the powers of his own imagination so strongly as we might expect in pictures of natural scenery. This poem has spirit and beauty in many passages, but is not much read in the present day; nor does it seem to be approved by modern critics. It was otherwise formerly. Webb, in his 'Discourse of English Poetry,' 1586, calls Spenser 'the rightest English poet he ever read,' and thinks he would have surpassed Theocritus and Virgil, 'if the coarseness of our speech had been no greater impediment to him, than their pure native tongues were to them.' And Drayton says: 'Master Edmund Spenser had done enough for the immortality of his name, had he only given us his 'Shepherd's Kalendar,' a masterpiece, if any."

The following are Mr. Hallam's remarks on the ballad-poetry of this age. For our own part, we are led, by various circumstances which we have observed, to believe that the distinction between Scottish ballads and English ballads, unless we take it with respect to the age alone, is quite fictitious. We are inclined to think that not only the ballads themselves, with the exception of the local ones, but that the airs, also, existed as an earlier period in England. The poetry of the minstrel, repeated with accidental variations from age to age, lived in the memory, and not in books, and it was only by a fortunate accident that any particular ballad was committed to writing. The very existence of the true minstrel depended upon that feudal spirit of clan-ship which disappeared in England, particularly in the southern and midland parts, at a comparatively early period, but which continued to exist in Scotland up to recent times. At the era of which we are now speaking, this spirit of clan-ship, among that part of the population of Scotland which spoke a Saxon

dialect, was strongest on the English borders, and was still felt, though in a somewhat less degree, throughout the northern counties of England. As this spirit had disappeared from the south, the representatives of the older minstrel took shelter in, and were confined to, the northern districts; and with them still lived that class of poetry which, in its pure form, had in the time of Elizabeth long disappeared from the parts where it had previously flourished. A few coincidences which we have ourselves remarked, confirm us strongly in this view of the case; which, it may be observed, explains exactly the circumstances stated by Mr. Hallam:—

“It would be a great omission to neglect, in any review of the Elizabethan poetry, that extensive, though anonymous class, the Scots and English ballads. The very earliest of these have been adverted to in our account of the fifteenth century. They became much more numerous in the present. The age of many may be determined by historical or other allusions; and from these, availing ourselves of similarity of style, we may fix, with some probability, the date of such as furnish no distinct evidence. This, however, is precarious, because the language has often been modernised; and passing for some time by oral tradition, they are frequently not exempt from marks of interpolation. But upon the whole, the reigns of Mary and James VI., from the middle to the close of the sixteenth century, must be reckoned the golden age of the Scottish ballad; and there are many of the corresponding period in England. There can be, I conceive, no question as to the superiority of Scotland in her ballads. Those of an historic or legendary character, especially the former, are ardently poetical; the nameless minstrel is often inspired with an Homeric power of rapid narration, bold description, lively or pathetic touches of sentiment. They are familiar to us through several publications, and chiefly through the ‘Minstrelsy of the Scottish Border,’ by one whose genius these indigenous lays had first excited, and whose own writings, when the whole civilised world did homage to his name, never ceased to bear the indelible impress of the associations that had thus been generated. The English ballads of the northern border, or, perhaps, of the northern counties, come nearer in their general character and cast of manners to the Scottish; but, as far as I have seen, with a manifest inferiority. Those, again, which belong to the south, and bear no trace either of the rude manners or of the wild superstitions which the bards of Ettrick and Cheviot display, fall generally into a creeping style, which has exposed the common ballad to contempt. They are sometimes, nevertheless, not devoid of elegance, and often pathetic. The best are known through Percy’s ‘Reliques of Ancient Poetry,’ a collection singularly heterogeneous, and very unequal in merit, but from the publication of which in 1774, some of high name have dated the arrival of a genuine feeling for true poetry in the public mind.”

We now come to the chapter on the English Stage, during the age of Elizabeth, in which Mr. Hallam has made due use (which they well merit) of the labours of Mr. Collier on this interesting part of our literary history. Mr. Hallam observes of Shakspeare:—

“Of William Shakspeare, whom, through the mouths of those whom he has inspired to body forth the modifications of his immense mind, we seem to know better than any human writer, it may be truly said, that we scarcely know any thing. We see him, so far as we do see

him, not in himself, but in a reflex image from the objectivity in which he was manifested; he is Falstaff, and Mercutio, and Malvolio, and Jaques, and Portia, and Imogen, and Lear, and Othello; but to us he is scarcely a determined person, a substantial reality of past time, the man Shakspeare. The two greatest names in poetry are to us little more than names. If we are not yet come to question his unity, as we do that of ‘the blind old man of Scio’s rocky isle,’ an improvement in critical acuteness doubtless reserved for a distant posterity, we as little feel the power of identifying the young man who came up from Stratford, was afterwards an indifferent player in a London theatre, and retired to his native place in middle life, with the author of ‘Macbeth’ and ‘Lear,’ as we can give a distinct historic personality to Homer. All that insatiable curiosity and unwearied diligence have hitherto detected about Shakspeare, serves rather to disappoint and perplex us than to furnish the slightest illustration of his character. It is not the register of his baptism, or the draught of his will, or the orthography of his name, that we seek. No letter of his writing, no record of his conversation, no character of him drawn with any fulness by a contemporary can be produced.”

For the detailed criticisms on Shakspeare, which are generally too long to extract, we refer to the work itself. We will similarly abstain from several extracts which we had marked out, and will close our notice this week with two short passages. On the whole, we think Mr. Hallam has hardly appreciated some of our earlier popular prose literature. The controversial tracts of the earlier part of Elizabeth’s reign, such as those by Thomas Norton, are often well written, and display no little eloquence. If we go back still further, the prose writings of the Wickliffites are extremely vigorous and elegant as compositions; and the same may be said of some of the older English Catholic writings. On the prose writers of Elizabeth’s reign, Mr. Hallam closes with the following general observations:—

“It must be owned, however, by every one not absolutely blinded by a love of scarce books, that the prose literature of the queen’s reign, taken generally, is but very mean. The pedantic euphonism of Lilly overspreads the productions which aspire to the praise of politeness; while the common style of most pieces of circumstance, like those of Martin Mar-Prelate and his answers (for there is little to choose in this respect between parties), or of such efforts at wit and satire as came from Greene, Nash, and other worthies of our early stage, is low, and, with a few exceptions, very stupid ribaldry. Many of these have a certain utility in the illustration of Shakspeare and of ancient manners, which is neither to be overlooked in our contempt for such trash nor to be mistaken for intrinsic merit. If it is alleged that I have not read enough of the Elizabethan literature to censure it, I must reply, that, admitting my slender acquaintance with the numberless little books that some years since used to be sold at vast prices, I may still draw an inference from the inability of their admirers, or at least purchasers, to produce any tolerable specimens. Let the labours of Sir Egerton Brydges, the British bibliographer, the ‘Censura Literaria,’ the ‘Restituta,’ collections so copious, and formed with so much industry, speak for the prose of the queen’s reign. I would again repeat, that good sense in plain language was not always wanting upon serious subjects; it is to polite writing alone that

we now refer. Spenser’s ‘Dialogue upon the State of Ireland,’ the ‘Brief Conceit of English Policy,’ and several other tracts, are written as such treatises should be written; but they are not to be counted in the list of eloquent or elegant compositions.”

On Literary Correspondence:—

“Another source of information was the correspondence of scholars with each other. It was their constant usage, far more than in modern times, to preserve an epistolary intercourse. If their enmities were often bitter, their contentions almost always violent, many beautiful instances of friendship and sympathy might be adduced on the other side; they deemed themselves a distinct class, a priesthood of the same altar, not ashamed of poverty, nor disheartened by the world’s neglect, but content with the praise of those whom themselves thought worthy of praise, and hoping something more from posterity than they obtained from their own age.”

MISCELLANEOUS.

Forty Sermons; with an Introductory Essay on the Origin, Rights, and Duties of the National Church. By the Rev. Richard Cattermole, B.D. 8vo. Pp. 463. London, 1839. Parker; Rivingtons; Hatchards; Rickerby; Rice.

We can hardly speak too highly of this volume, which does honour to the author in his position as a divine belonging to the Established Church, to his talents as a literary man, and to his intellectual capacity as an enlightened judge of all that concerns the religious instruction of the English people. If he firmly asserts the rights of the Church, he does not disguise its duties; if he ably traces its origin and authority, he does not shrink from declaring the improvements which the progress of society has rendered expedient. The introductory essay, though short, is very impressive; and the sermons inculcating, in language well suited to the different subjects, every obligation of religion and morality—what we owe to God, our neighbours, and ourselves—are of so eminently virtuous and practical an order, that we do not hesitate most earnestly to recommend them to every Christian and Christian family.

Des Idées Napoléoniennes. Par le Prince Napoléon-Louis Bonaparte. 8vo. Pp. 229. Londres, 1839. Colburn.

THE political character of this volume, the views it takes of the measures of Napoleon, and, we presume, the ulterior views for the promotion of which it is published, remove it from the category of our literary review. All we can say of it is, that it is written with elegance and spirit, justifies the reign and all the plans of the Emperor, and ascribes his fall to his attempting to accomplish too much for the liberty of France and the benefit of Europe, within too short a space of time; because, in short, “Il voulut, en dix ans d’empire, faire l’ouvrage de plusieurs siècles.”

The Collected Works of Sir Humphry Davy, Bart., LL.D., F.R.S., &c. Edited by his Brother, John Davy, M.D., F.R.S. Vol. I. Memoirs of his Life. Pp. 475. London, 1839. Smith, Elder, and Co.

A PORTRAIT, from a bust of the distinguished individual to whose collected works this biographical volume is a prelude, adorns it as a frontispiece; and there are autographs and other illustrations. The *Memoirs* appear to us not to be very materially altered from the *Life* already separately published by Dr. Davy; and therefore we need only speak of the present edition as a necessary portion of the

valuable philosophical and other interesting productions of Sir Humphry Davy.

Life of Mrs. Siddons. By Thomas Campbell. 12mo. Pp. 278. London, 1839. Moxon.

A VERY pretty edition of the life of our most distinguished female tragedian. Could we have one like her now, or even within many degrees of her excellence, what a treasure it would be for the stage! It is in this department that we are most lamentably deficient; and the want weakens the cast of almost every lofty play.

A Letter from Peter Wilkins to Isaac Tomkins. Pp. 24. (London, Southgate).—A bitter political attack on Lord Brougham. The following, however, is but too generally applicable, and we quote the preface in the hope that it may be considered by some one or other:—

"To be serious and 'review' a little—public men are greatly changed from what they were once, when the point of honour was to abide by the result of long study and matured judgment. A forty years' opinion is now flung overboard in a moment of caprice. Insincerity is the law of the day; the people are duped openly now to a degree unparalleled; seal and good offices from individuals, acknowledged by many professions of obligation, are repaid with coldness and evasion by public men who can benefit their own selfishness no longer by them: just as the people are made the victims of a more extended insincerity. The bonds of high feeling in politics seem now to be loosened; public men without political honour are every where encountered. To the old severity and pride of character, to the dread of the impeachment of judgment, and the destruction of the bond of public respect, has succeeded a recklessness of public opinion, if a name can but be obtained—if men can only be talked about. There is more of Fieschi than we dream of in the world—of spirits that would dare all things for a damnation to everlasting fame."

The Authors of France, &c. by Achilles Albites, R.A., and B.L. Pp. 71. (London, Whittaker and Co.)—*A coup d'œil* over the literature of France: a mere outline it is true, but a pleasing little book,—a sort of historical and anecdotal catalogue.

On the Discharging, Discharging, and Pensioning of Soldiers, &c. by H. Marshall, F.R.S.E. 8vo. pp. 259. (Edinburgh, Black; London, Longman and Co.)—That a work of this class should have reached a second edition, is a proof of its value. The Deputy Inspector-general of Hospitals has done a praiseworthy duty in giving it to the public, and shewn himself a true friend to the army.

Travels in the East, &c. by A. de Lamartine. (Edinburgh, Chambers; London, Orr and Co.)—This is with justice called the "People's Edition," for it is a good translation of Lamartine's well-known and highly appreciated work, in an 8vo. of 320 pp. and double columns, at the price of 3s. 9d. A memoir of the author is also given, and explanatory notes. In another form, the cost must be four or five times as much.

ARTS AND SCIENCES.

WATER-SPOUTS.

To the Editor of the Literary Gazette.

SIR,—In your Number of the 29th June, I observe you express a wish to obtain information from those who have been accustomed to observe water-spouts, under what appearance they first present themselves. Having myself, on various occasions, been surrounded by many of them during calms in the West Indies, I beg to acquaint you that they have generally presented themselves as issuing from black clouds, from twenty to thirty yards in diameter, from the centre of which would descend a funnel of about the size of a beer-barrel of six or eight feet in length, which, when it had descended about that distance, would be again drawn up by an apparent suction of a body in the clouds; from which it would again descend about double the first distance of its first descent, when it would again, from an apparent suction, be drawn up into itself, and thus alternately react, until it came in contact with the sea, which it appeared to act upon as a pump, by drawing up the water into the cloud; which, when it became surcharged, disgorged itself again into the sea, and so continued to act, until the power acted upon it within the cloud became apparently exhausted, and the cloud itself dispersed. In short, when I saw one of the kind of funnels which I have described, it always reminded me of one of those powder-puffs which my servant, half a century ago, used to make use of to give my head a

frosted appearance; and which powder-puff he contracted or elongated as circumstances required. Such appeared to me the water-spouts as above described by, Mr. Editor, your humble servant,
A. M.

July 16th, 1839.

ELECTRO-MAGNETIC PRINCIPLE.

A RECENT number of Bennet's "New York Herald" contains the following account of the successful application of the Electro-Magnetic Principle:—

"Yesterday morning we visited a new establishment, erected at 68 Gold Street, for the construction of machinery to be put in motion by the application of the electro-magnetic fluid, or spirit. In the apartments we found several machines in different states of construction—one of them, of a large size, being then in operation. The machine in operation consists of a large wheel, of about sixteen or seventeen feet in circumference, placed in a vertical position, and surrounded with four large magnets operating on its outward circumference, with the smaller ones near the centre. Within a few inches stands the galvanic battery, for the generation of the fluid that sets the whole in motion. The construction of the battery is so well known, that it is hardly necessary to enter upon a description. It is in the form of a rectangular tub; in which is placed a series of zinc and copper plates, immersed in a weak solution of sulphuric acid. The battery is attached to the large electric wheel by a series of metallic conductors. The operation of the wheel is most striking. In a certain portion of the machinery the fluid, interrupted in its movements, emits, with a snapping noise like a percussion-cap, vivid and most brilliant flashes of light, equal in intensity to the lightning of heaven. This succession of flashes continues during the operation of the machinery. We put our finger into the centre of the flash, but no sensation, except the ordinary one, was produced—but on the application of a piece of steel, the material was melted into red and orange sparks, and gradually corroded under the action of the fluid. The movement of this machine presents one of the most beautiful and extraordinary experiments in electro-magnetism that we ever witnessed. But its beauty and magnificence are its least recommendation. It brings us at once to a new era in mechanics and motion. This wheel is equal in power to that of two able-bodied Irishmen, in giving movement to any kind of machinery. Another machine was shewn us, equal to four or five men; and preparations are making to construct machines of any extent of power. This new application of the electric spirit, or fluid, has removed all the difficulties which Cook and Davenport met with, two years ago, in their attempts at the same thing. We are making arrangements on ourself to set aside our steam engine, and to procure one of these electric machines to drive our double-cylinder printing press. We learn that a machine suitable for our purposes will cost about three hundred dollars, and that the expense of keeping it a-going all the time will be only equal to twenty-five cents per day, consisting of sulphuric acid to supply the battery, exclusive of the metallic plates of zinc and copper, which are only changed at long intervals. The company of private gentlemen who have brought this great invention to perfection have expended about 12,000 dollars in experiments, during the last year. They have procured a patent right and a charter, and they will probably organise themselves very soon. They will

then receive subscriptions for the stock. On the whole, we look upon the invention of applying the power of the electric fluid to mechanics and motion as now complete. Every difficulty has been surmounted, and some of the first engineers of America and Europe have acknowledged the truth of what we now say. It is, beyond a doubt, one of the greatest and most wonderful inventions of the age. The safety, ease, economy, and power over such machinery, are beyond all other systems. The danger from fire is entirely obviated; for although the fluid, during the operation of the machinery, flashes forth in a succession of big, brilliant drops of liquid fire, to all appearance, yet a piece of paper, even gunpowder, may be applied to this apparent fire, but no ignition takes place. It ignites steel or iron, or other metals, but no non-conducting substances. We trust the proprietors will open their thunder and lightning manufactory, and let the public see the extraordinary invention which is now brought to inimitable perfection. In less than a month we hope to print the 'Herald' by the operation of the same fluid which forms the thunder and flashes through the heavens in lightning."

LITERARY AND LEARNED.

To the Editor of the Literary Gazette.

SIR,—As my son was endeavouring, on Monday last, to get a nibble from some poor gudgeon, or other simpton of the finny tribe, in the New River, his hook became entangled with sundry MS. letters of men, the giants of those days; such as Samuel Johnson, Addison, and other *ejus generis*. Many others, it appears by his statement, and that of two piscatory attendants, were floating in the stream beyond the length of his rod and line. Those brought home by the little "fool at the one end," as Johnson has partially defined fishing, were in such a state, from aquatic saturation, as scarcely to be decipherable; yet I can make out clearly, after some pains, the following specimens, and more will be sent, if desired.—

Johnson to Richardson.

"Dear Sir,—I am extremely obliged by the favour you have done me. To quarrel with what is received, because one does not receive more, is not justifiable; yet I have almost a mind to retain these sheets. Will you send me the other volume? To wish me to go on as you have begun, would to many be a very kind wish; but you, sir, have, beyond all other men, the art of improving on yourself. I know not, therefore, how much to wish, as I know not how much to expect; but of this be certain, that much is expected from the author of 'Clarissa.' I am, sir, your obliged, humble servant,
SAMUEL JOHNSON."

Now what does this prove? A variety of the most obvious and interesting facts—the most startling of which, perhaps, is, that Johnson condescended to lower his colossal mind to the level of Richardson's, in aiding him in supplying sentimental and passion-feeding trash to the sensualists of those sensual and unintellectual times.

Another thing picked out of oblivion is from Addison to Wortley. *Verbatim et literatim*, as in the preceding case, it runneth thus:—

"Dear Sir,—The last time I had the honour to see you, I was in so much haste that I could not tell you that I had been talking of your *litt-a-tite* to my Lord Harfax that day, who expressed himself with a great deal of friendship and esteem. I have not yet made the grand experiments. We think here as you do in the country, that France is on her last legs."

By a mail just now arrived, we hear that the Duke of Marlborough had made a movement, to prevent the junction of the two armies under the Dukes of Vendome and Berwick. They give out that they will resign all, rather than lose little; and they of the army are of opinion that we are at the point of a general action, which our friends are very eager upon. There has been an action between the Marshal de Villars and the Duke of Savoy, which the French tell to their advantage; but as soon as our letters come from Switzerland, we hope to have a better account of it: for the French letters own that, immediately after their pretended success, the Duke of Savoy took Exilles. I am, dear sir, your most faithful and most humble servant,
J. ADDISON."

"Aug. 17th, 1706, &c."

Another letter is from Queen Anne to the Duke of Marlborough, &c. &c. These letters are certainly of considerable interest, and may be considered of great value to the parties who have lost them. Those which so accidentally have been preserved, shall be instantly restored to any one who can adequately describe them; and I deeply regret that the whole parcel was not within reach of my picaresque juveniles. I have the honour to be, sir, your most obedient servant,
J. M. F. W.

18 Devereux Court, Temple,
24th July, 1830.

PINE ARTS.

THE NELSON COLUMN.

WE have been much amused with the history of this famous column, which, now that the matter is settled, may, without injury to any one, be put on public record as a memorial how such things are done, and a sample of the excellences to be expected from the much-bepraised principle of public competition in national works of art.

The artist, as we formerly noticed, though an able architect, was utterly inexperienced in sculpture. Strongly backed, however, by *Somebody* who could, in the event of success, supply that portion of the monument, Mr. Railton's design—drawn, as we are informed, by another hand, and being in its columnar character simply an enlargement of one of Mr. Wilkin's fluted pillars in the portico of the National Gallery—was duly laid before the committee. Opinions in his favour were vouchsafed to the ears of a majority of these noblemen and gentlemen; and the votes, canvassed and influenced by such opinions, awarded the prize to the Brobdingnagian column. The decision made, it became necessary to enter upon details, and a curious result ensued. The estimate was 30,000*l.*; viz. 14,000*l.* for the column, and 16,000*l.* for the sculpture; consisting of the statue of Nelson at the top, the reliefs on the four sides of the pedestal, and the lions which were to watch the corners. Mr. Railton, of course, stated that he must employ *Somebody* to execute these works;—he himself would build up the granite, but as for the bronze he knew nothing of it. Then appeared the secret springs and movements by which the business had been managed; and the committee began to catch a glimmering light at the way, and for what purpose, they had been bamboozled.

It may readily be believed that their sense of their position was not exactly such as to render them complacent to others, or quite satisfied with themselves. Some of them felt as if they had been tricked into an immature decision, and they rather indignantly set their faces against finishing the job in the manner that had been hoped for. It was resolved, and we

think judiciously resolved, not to give the sculpture to any one individual, and especially to an individual who had not entered into the competition; but to divide it among the most eminent and meritorious of those artists who had answered their invitation, and sent in models for their judgment. Thus we understand that Mr. Bailey is to execute the statue of Nelson; Mr. Lough, the lion's guardant (his own sailors, or Mr. Worthington's, would be more appropriate); and several other distinguished artists the emblematical figures on the sides of the pedestal.

When all is completed, may we not truly say that this is a Monument of the *Composite class* !

SKETCHES.

THE MACREADY DINNER.

IN every thing that regarded the spirit and intention of this entertainment, the meeting went off with the utmost *clat*. The great hall was filled with company; the tables graced with a rare proportion of individuals, highly distinguished in various walks of life; and nothing could exceed the enthusiastic reception given to the Guest of the day, and the renewed thunders of applause whenever an allusion to him afforded an opportunity for expressing these sentiments of popular admiration and public and private esteem.

In the course of the evening, the assembly were addressed by H. R. H. the Duke of Sussex, the chairman; who, in proposing the health of Mr. Macready, enlarged upon his merits as a gentleman, his talents as a member of the stage, and his patriotic exertions for the restoration of the English drama; and also by the Marquess of Conyngham, Mr. Milnes, Sir E. Lytton Bulwer, Mr. Shiel, Lord Nugent, Sir Martin Shee, Mr. Dickens, and Mr. Serle. All concurred in doing honour to the personal virtues, the genius, and the disinterested zeal and unbending integrity with which Mr. Macready had carried through the arduous struggle of two seasons, and once more placed the profession of an actor and the character of dramatic literature and representation upon that elevated position, without occupying which they are a disgrace instead of a credit to a civilised people.

There were two or three points which interfered somewhat with the perfect enjoyment of the scene, and which arose from the stewards not being conversant with the duties of their office, or taking any trouble to fulfil them. There was not one of their number at the side-tables to regulate their proceedings, and see to the comfort of the guests.* All were on the *deist*, and ranged at the topmost places, leaving the company to shift for themselves, and act as they liked. One of the consequences was a considerable and disagreeable inclination to noise at the "lower end of the hall," which interrupted the speakers, and often rendered them inaudible to the more quiet, who were anxious to hear them distinctly. Had stewards been at the bottom as crouplers, this would not have happened. Mr. Milnes' toast was another injudicious arrangement. The "Memory of Shakspeare" was not fit for an exhilarated and numerous social meeting. In a lecture-room, such a theme might be listened to; but on an occasion like this, where the many cared

only to see persons of some note, and application to the immediate business of the day, no eloquence upon any other topic could hope for attention; and these two causes co-operating, rendered Mr. Milnes' address, after a few sentences, a period of confusion. These trifling drawbacks, however, had no effect upon the general harmony, which was improved by the music under Mr. T. Cooke, with a delightful band of assistants, including Miss Rainforth, Miss Hawes, Hobbes, Bellamy, and other eminent vocalists.

The royal duke sat till eleven o'clock; and it may with truth be stated that there was nothing wanting which could gratify the feelings of the individual to do honour to whom the *fête* was given. A subscription was entered into, and above 300*l.* at once subscribed, to present him with a piece of plate; and it was more than once suggested that if the patent theatres again retrograded, a strenuous effort should be made to obtain a House worthy of the country of Shakspeare, and the labours and superintendence of Macready.

THE DRAMA.

Her Majesty's Theatre.—*William Tell* has been produced; but it is, after all, a heavy opera, and we need not go into any criticism upon it.

Drury Lane.—At a stormy meeting of the proprietors on Wednesday, Lord Glengall in the chair, Mr. Dunn read the report of the managing (?) committee, from which it appeared that there was an arrear of rent within the last three years amounting to 12,211*l.*; and that last season only 1350*l.* had been paid out of the stipulated 6000*l.* Such is one of the results of degrading the stage; not to mention the severe privations and insults to which the performers have been exposed. It is true that the principal losers among them, those in the upper classes of the profession, are not to be pitted; for persons who lend themselves to countenance the lowest practices, and evince no feeling of self-respect, deserve to suffer with the cause they betray. The poorer orders, unhappily, cannot help themselves; and their condition is grievous.

After making the theatre what they have allowed it to be made, the proprietors have been fortunate in getting Mr. Hammond to take it for three years, at the reduced rent of 5000*l.* per annum.

Haymarket.—On Monday, Mr. Kean took his farewell benefit in *Hamlet*, which is thought to be his best character. The house was crowded to the utmost, and at the close the applause was of the most enthusiastic description. Covent Garden (market), as far as flowers are concerned, was thrown upon the stage of the Haymarket.

On Tuesday, Mr. Buckstone's new comedy, *Single Life*, was produced with entire success. The plot is amusing, and the principal characters truly original; the acting is in all parts equal to the author's conception; and to the buoyancy, activity, and unflinching exertions of the performers (including Mr. Buckstone), he is deeply indebted for the unequivocal reception of the piece. We have some difficulty in particularising where all are so good: but Mr. Strickland's "Woman-hating Bachelor," and Mrs. Glover's "Man-hating Spinster," are glorious specimens of what comic acting should be: nothing can go beyond the blunt ill-breeding of the latter, who shews us here the perfection of what may be called the Old School—and one scene, a quarrel between these two, is full of the richest humour. Mr. W. Lacy, foppishly dressed, and

* But for the excellent management of Messrs. Cuff, this would have been still more annoyingly felt. It is a curiosity to see how so crowded a company are provided for, and attended to, through their experienced arrangements.

gentlemanly looking, is the very perfection of a "self-loving bachelor." Mr. Buckstone is from top to toe a bashful youth; and Mr. Webster and Hemming, also bachelors (fluctuating and mysterious), aid and abet the laughter-provoking actors and actresses afore-named; and Mrs. W. Clifford, Mrs. Dawson, Mrs. Fitzwilliam, and Miss Travers, are powerful auxiliaries, as vilified, singing, insinuating, and romantic spinsters. If genuine merriment and warm applause may be considered a token of success, Mr. Buckstone's comedy will long claim a foremost place.

On Wednesday, a two-act drama, called *The Village Doctor* (from the French, we believe, and by Mr. Webster himself), followed the new comedy; it is serious, and possesses few claims to public favour, unless we can find entertainment in seeing a first-rate comic actor (Mr. Farren) in a poor part more than half tragic; a sweet actress (Mrs. W. Lacy) with scarcely any thing to do; and the only fun consisting of indelicacy (to use the softest term) allusions. Its reception was doubtful.

English Opera House.—This theatre opened on Monday, under the direction of Mr. Balfe, and until Thursday no novelty was produced; the *Opera Buffa di Diadeste, or the Veiled Lady*, being revived, and other favourite musical pieces nightly added to its attractions. The composer's (Mr. Balfe) own light and airy acting, and his sweet voice in unison with that of Miss Rainforth and of Mr. Fraser, are the most pleasing things in this production; which is, however, we observe, about to yield to new performances announced for next week.

On Thursday a farce, from the ever-popular pen of Mr. Lover, was played with entire success. It is called the *Hall Porter*, and the humor is drawn from a tallow-chandler's lady (Mrs. Garrick), who has succeeded to a millionaire uncle, assuming the habits of her Order in Belgrave Square, and looking much for instruction, in her course of proceedings, to her servant in that capacity (Mr. F. Mathews), who has lived forty years as porter to a duke. Her endeavours to act the genteel and noble under such auspices are excellent; and as both performers conceived and acted their parts capitally, there was no want of laughter to reward them and the author. An honest Irish footman (Lee), and an impudent cockney ditto (Hoxton), accompanied by another worthy of the same kidney (Sanders), added much to the fun, and to the piquancy of a satire not ill-deserved by the class to which they belong. But the great merit of the farce is the extreme neatness and force of the dialogue. The hits are continual and palpable; and, in truth, some of the wit is almost too fine for the species of entertainment. It is imbued with the genuine *vie comica*. In the usual love-affair, Mr. Brindal and Miss Lucy Bennett sustain the weight of the feathery god; and Mr. Turnour, Mr. Cullenford, Mr. Bender, Miss Goward, and Miss Connelly, fill the minor characters with good effect. The curtain fell, and the *Hall Porter* was announced to open the doors hereafter with great applause; Mr. Lover was loudly demanded, and made his bow on walking across the stage.

In the *Quaker*, which followed, Mr. Leffer sang the "Lads of the Village" delightfully, and was encored.

Strand Theatre.—Another clever and amusing novelty has been added to the merry stock of this little theatre. *Seth Slope* affords ample opportunities for the display of the Yankee talent of Mr. Hill, whose exhibition of American peculiarities in dress, speech, and action, brings the manners of a class of her citizens

more significantly and readily home to us, than even the Great Western or the British Queen. It is a laughable affair.

VARIETIES.

Grace Darling.—We were unfortunately too late to see a painting of this interesting subject by Mr. Parker, which was taken on the spot shortly after the unfortunate wreck of the *Forfarshire*; but, through the kindness of the Messrs. Ackermann (for whom it is engraving), we have been permitted a view of the etching by Mr. Lewis, which is highly characteristic, and holds forth promise of the future excellence of the print. The subject is of deep interest, and particularly to all connected with maritime affairs.

Mr. Martin's Picture of the Coronation has been on private view since our last. Its general effect is splendid, and gorgeous in the extreme. We have had no opportunity to make ourselves acquainted with the details.

Botanic Gardens.—On Thursday, a second promenade was opened for the exhibition of the grounds of this new Society, in the inner circle of the Regent's Park. The day was very favourable, and the specimens of botanical productions, and other sights and arrangements, met with great approbation. Some new and beautiful plants and instruments of culture attracted particular notice.

Tea-Totalism is flourishing, according to newspaper paragraphs; and ships go to sea under its strictest rules, with sailors, usually so superstitious, not afraid of the ominous name of *Wreck-abites*.

Sentimentality.

"Oh, see you flock of lovely sheep
Browse on the mountain's side!"

Thus to her hungry grandpapa
A miss romantic cried:

"Thou silly, sentimental child!

How shall I hope to meet her!

Lovely—when perhaps among them all

There is not one that's tender!"—H. M.

LITERARY NOVELTIES.

[We think so highly of the literary usefulness of the following Hints, that we have been induced to commit a wholesale robbery, "go the whole hog," and reprint them entire: for which we hope their author will pardon us.—Ed. L. G.]

A Few Hints to Novices in Manuscript Literature. By James Orchard Halliwell, Esq. F.R.S., &c. &c., of Jesus College, Cambridge. London, 1839. Rodd; Cambridge, Stevenson.

THE questions that are constantly asked by persons requiring individual references to the authority of manuscripts, make me compile the following few notes, which are sent into the world to form a prelude to a larger treatise, will prove useful to many. It need scarcely be remarked that they are not addressed to the antiquary, because it is only a small portion of his incipient study to make himself acquainted with every thing here brought together; but, at the same time, this scrap of information may be beneficial to one whose studies are of a more modern nature, and yet occasionally wanting access to materials constructed previously to the invention of typography. For such an one, then, these brief memoranda are intended.

I.—Catalogues of Manuscripts.

The principal printed Catalogues we possess of MSS. in England are the following, which I have put down, without any arrangement, in the order they stand in my library:—

1. Catalogi librorum manusciporum Anglie et Hibernie in unum collecti, fol. Oxon. 1697.

BODLEIAN.

1. Codices Græci Baroccliani, p. 1.
2. Codices Græci xxvi. Hebraici i. Arabicus i. et Latini i. ex dono Thomæ Ros. p. 35.
3. Codices Græci xxii. Russici ii. Pars residua bib. Barocclianæ acceptæ ex dono Oliveri Cromwelli, p. 39.
4. Codices MSS. var. ling. Guil. Leand. p. 48.
5. Cod. MSS. Latini Kemeini Digheii, p. 77.
6. Cod. MSS. ex dono Thomæ Bodleii, p. 69.
7. Cod. MSS. Orient. Johannis Seideni, p. 157.
8. Cod. MSS. in Hypocod. Bodleiano vastarum linguarum et beneficiorum variorum, p. 161.
9. Collect. Dodsworth, p. 187.
10. Collect. Leland, p. 235.
11. Cod. MSS. Fr. Junii, p. 240.
12. Collect. Richardi Janseni, p. 258.
13. Jo. Casauboni adversaria, p. 268.

14. Gerardi Langbaini adversaria, p. 268.
15. Cod. MSS. ex dono Thomæ Mareschalli, p. 272.
16. Cod. MSS. Eduardi Pocockii, p. 274.
17. Libri Orientales Roberti Huntingtoni, p. 279.
18. Libri Orientales Thomæ Hyde, p. 286.
19. Cod. MSS. Thomæ Barrovii, p. 288.
20. Cod. MSS. Gulielmi Dugdalei, p. 292.

OXFORD.

1. Bibliotheca Savilliana, p. 299.
2. Bib. Ashmollana, p. 315.
3. Cod. MSS. Ant. à Wood, p. 359.
4. College Libraries (sep. pag.).

CAMBRIDGE.

1. College Libraries (sep. pag.).
2. Bibliotheca Publica.

Then follow slender catalogues of other MSS. libraries in England and Ireland, which need not be referred to here. It may be mentioned, that the whole volume is most wretchedly executed: it was published under the direction of Edward Bernard.

II. A Catalogue of the Harleian MSS. in the British Museum. By Archdeacon Nares and others. 4 vols. fol. Lond. 1808-12. [The first portion of this Catalogue is very well compiled, but the third volume is full of imperfections. An index, classed and alphabetical, comprises the fourth volume.]

III. A Catalogue of the MSS. of Francis Hargrave, now deposited in the British Museum. By Sir Henry Ellis. 4to. Lond. 1818. [Consisting almost exclusively of law.]

IV. A Catalogue of the Lansdowne MSS. in the British Museum. By Mr. Douce and Sir Henry Ellis. Folio. Lond. 1819. [In two parts: the first comprises the Burghley papers.]

V. A Catalogue of the MSS. in the King's Library in the British Museum. By David Casley. 4to. Lond. 1794. [Generally very correct.]

VI. A Catalogue of the additional MSS. in the British Museum, including the Sloan and the Birch collections. By S. Ayscough. 2 vols. 4to. Lond. 1782. [This is an absurd attempt at a classed catalogue, and, without exception, is the very worst failure at a classification that has ever come within the notice of the learned world: the principal information that can be got from it, is that the author (who appears to have been a man more fitted for making an index to Mr. Dickens's "Pickwick" than any thing else, and I question whether a more low literary labour could be pointed out,) was not able to read a page of an old MS. correctly. A new catalogue of these MSS. is in the press. Besides Ayscough's catalogue, there are in the reading-room, 23 volumes in MS. of catalogues of additional manuscripts.]

VII. A Catalogue of the Cottonian MSS. in the British Museum. By Mr. Planta, folio, 1802.

VIII. A Catalogue of the Arundel MSS. in the British Museum. By the Rev. J. Forshall, fol. 1834. [This catalogue is constructed on a most excellent plan, and completed with equal or more ability than any other I am acquainted with.]

IX. A Catalogue of the Burney MSS. in the British Museum, fol. 1839. [A catalogue of the Oriental MSS. in the Museum is in course of publication. The part containing the Syriac and Chaldaic MSS. is already published.]

X. A Catalogue of the MSS. in C. C. College, Cambridge, by James Nasmith. 4to. Cantab. 1777. [A very able catalogue by Nasmith, of the MSS. in the Public Library, yet remains unprinted.]

XI. Cod. MSS. ecclesiæ cathedralis Dunelmensis catalogus classicus, descriptus a Thomæ Rud. fol. Dusehm. 1824.

XII. A minute Catalogue of each particular MS. contained in Wood's collection at Oxford, by William Hurd, 8vo. Oxford, 1761. [This has been reprinted by Sir Thomas Phillips, Bart., in folio, at his private press, Middle-Hill, Worcester-street.]

XIII. Bibliotheca Bodleiana Cod. MSS. Orientalium Catalogus, fol. Oxon. 1797-1831.

XIV. Codices MSS. et impressi cum notis manuscipis, olim d'Orvilleani, qui in Bibliotheca Bodleiana adservantur. 4to. Oxon. 1805. [The earliest existing MS. of "Euclid's Elements of Geometry," written in the ninth century, is in this collection.]

XV. Catalogus sive notitie Manuscipiorum, qui a Cel. E. D. Clarke, comparati in Bibliotheca Bodleiana adservantur. Pars prior. 4to. 1812. (T. Galsford.)

XVI. A Catalogue of the Archiepiscopal MSS. in the Library at Lambeth Palace, fol. Lond. 1812. [By Todd. This is generally considered to be a good catalogue, but not, I think, by any one who has had occasion to examine many of the MSS. It is full of imperfections and errors.]

XVII. Catalogi librorum manusciporum, qui in Bibliotheca Gallie Helvetice, Belgii, Britannicæ M., Hispaniæ, Lusitanie adservantur, nunc primum editi a D. Gustavo Haenel. 4to. Lipsæ. 1830. [Of all the execrable works that ever any mortal had the maximum impudence to place before the view of a civilized literary world, this is by far the very worst. Not a single MS. is properly described: the majority without dates, while miscellaneous raris, volumes of old English poetry, opuscula, &c. occur in every corner. The list of catalogues of foreign libraries of MSS. is good, and to it I refer the reader, because, in many cases, I could do little more than transcribe their titles.]

II.—Initial Abbreviations.

The following is a list of some of the most common ones for the letter A, and will serve to show the multifarious nature of these abbreviations:—

Ab	Alter	Argentum
Abesto	Amantissimus	Aristoteles
Abi	Ambo	Artificialis
Actiacus	Amen	Asia
Actio	Amicus	Assignatus
Actus	Amis	Amis
Ad	Anima	At
Adilia	Animus	Auctor
Adilius	Anulus	Auctoritas
Adilla	Anus	Augusta
Adriarum	Ante	Augustalis
As	Antiocha	Augustus
Ager	Antonius	Aulus
Agro	Apollo	Aurelius
Agrippa	Apponere	Aurum
Agrippina	Apud	Auspicium
Aio	Aqua	Aus
Ala	Anstrum	Auxilium
Albus	Arbitratus	Avis
Alius	Arbitrium	Avus.

III.—Abbreviations in General.

It is not my intention to enter very fully into this subject, preferring to leave that labour for my future treatise on Palaeography. It may be well, however, to warn the uninitiated transcriber against the fatal error of conjecture in matters of this nature, except where satisfactory demonstration cannot possibly be discovered, and he may be then prevented from mistakes similar to the ignorant one of attributing to the mystical letters I H S the convenient interpretation of *Jesus Hominum Salvator*, and perhaps avoid a modern congregation of eleven thousand virgins and martyrs.

The scepticism of the uninitiated in matters of this nature is perfectly astonishing, and numerous instances have fallen under my notice where hesitation at belief as to the age and interpretation of manuscripts has been shewn towards men most skilled in manuscript lore. I remember some time ago being fairly and perpetually contradicted, when I stated that a certain MS. had been written about 1470, the exhibitor of it being fully convinced in his own mind that it belonged to the reign of Elizabeth, — a discrepancy absolutely ridiculous, and shews the strange though happy ignorance of some wise-acre possessors of manuscripts. It would be well to inform such men that the age of a middle-age manuscript can in most cases be ascertained much more accurately than the best conjecturer could determine that of a human being.

The facsimile opposite the title-page is from a charter preserved in the August Office of the time of 1 Ed. III.; the following is an interpretation, if it may be so termed:—

"Omnia Christi Fidelibusque Scriptum visuris vel audituris Wilhelmus de Hotot de Wolveston Selu. Novit illis me concessisse et dimississe Adm Robat de eodem duas Rodas Terra Jacutes in Campa de Wolveston Videlicet una Roda super Langdonhij juxta Terram Johanne Hotot et una Roda super Blackelond juxta Terram Rogeri Grumbaud habendum et tenendum predictas Rodas Terra predicta Adm et Assignatis suis ad Terminum Vitae sue et duorum Annorum subsequenter post vitam dictae Adm libere quiete reddendo mihi per Annum unum Roman ad Festum Sancti Johannis Baptiste et ego predictus Wilhelmus et Haeredit mei totum predictum Terram predicta Adm et Assignatis suis ad Terminum predictum contra omnes Gentis varantissimus. In cuius rei Testimonium hunc presentem scriptum in modum Circographi confecto Sigilla nostra alternatim apposuimus. Hic Testibus Johanne de Hotot, Rogero Grumbaud, Johanne Jekis, Lamberto de Cloyton et Henrico Martyn et alijs Datum apud Wolveston Die Dominica in Festo Sancti Lucae Evangeliste Anno Regni Regis Edwardi Tertij a Conquestu primo."

This will serve to give the reader some idea of the nature of easy MS. contractions.

In some early printed books the contractions are numerous. For example, the following passage from Okham's 'Logic,' the contractive marks omitted, is not at first sight very evident in meaning:—

"Sic hic e fal sm qd ad simplr a e pducibile a Deo g a e et sic hic a n e g a n e pducibile a Deo."

* In old Latin manuscripts the Greek letters of the word Jesus are always retained, with the exception of the terminations. Jesus is written I H S, or in smaller characters i h s, which is the contraction for *Iesus*; from which it is evident that the Latin scribes confused the *s* and the *h*, — not surprising when we take into consideration their identity as capitals, and the extreme ignorance of the transcribers. It is often retained in old English manuscripts, as for instance in the commencement of a poem called "Paseo Domini," in the Cambridge Public Library, Ff. 5, 48:—

"Herkyus now! if ye wille here
Off mycull pyte; ye now lere
Off ihs that va alle wrought;
And syn he oure sowles bowt."

In Greek manuscripts, however, only the first and last letters invariably occur. The dash over the word—the symbol of abbreviation—some have changed to the sign of the cross—

† I H S

and so generally has the monkish interpretation of *Jesus Hominum Salvator* been adopted, that even now in some churches on the continent it is inscribed at full length.

The meaning of which is:—
"Sicut hic est fallacia secundum quod ad simpliciter.
A est producibile a Deo; ergo A est; et similiter hic; A non est; ergo A non est producibile a Deo."

LIST OF NEW BOOKS.

First Annual Report of the Registrar-General, 8vo. 3s.—Historical Records of the British Army, Third Regiment of Foot, 8vo. 12s.—Ystradgylt, A Descriptive Poem, by Mrs. Bowen, post 8vo. 7s.—Hobbes Works, by Sir W. Molesworth, Vols. VI. and VIII. 8vo. 12s. each.—The Jotting Book, a Political and Literary Experiment, post 8vo. 5s.—Peter Parley's Geography of the Bible, square, 3s. 6d.—The Hand-Book to the Chancery Judges' Opinions, by G. Farren, 8vo. 6s.—Life of Mrs. Siddons, by T. Campbell, new edition, fcap. 7s.—Poems by Lord Leigh, now first collected, fcap. 7s.—Gibson's Land Surveying, new edit. by M. Trotter, 8vo. 9s.—Three Months in the North, by G. Downes, 12mo. 5s.—Goodwood, its House, Park, &c., by W. H. Mason, post 8vo. 6s.—Fardoughs the Miser, by W. Carleton, post 8vo. 10s. 6d.—Bills of Costs, by E. W. Gilbert, 2d edit. 8vo. 9s. 6d.—Dr. F. W. Krummacher's Sermons on the Canticles, 2d Series, 12mo. 2s.; 3 Vols. in one, 3s. 6d.—The London Catalogue of Books, 1814 to 1839, 8vo. 20s.—Transactions of the Horticultural Society, Vol. II. Part IV. 4to. 16s.—Burgh on the Revelations, 4th edit. 12mo. 7s.—Tinterne, and its Vicinity, by W. H. Thomas, 12mo. 3s. 6d.—Bible Gems, by the Rev. J. Stewart, 2 vols. 12mo. 21s.—Letters from Germany and Belgium, by an Autumn Tourist, 12mo. 5s.—Le Château de Melville, 12mo. 3s. 6d.—Expository Address to the Methodists of Ireland, by J. Walker, 12mo. 4s. 6d.—Wild Sports of Southern Africa, by Captain W. C. Harris, post 8vo. 10s. 6d.—Polynesia; or, Missionary Toils and Triumphs in the South Sea Islands, a Poem, post 8vo. 4s. 6d.—A Paper of Tobacco, by Joseph Fume, fcap. 4s. 6d.—Charles and James; Monksyville for Boys, 1s. 6d.—Des Idées Napoléoniennes, par le Prince Louis Napoléon Bonaparte, 8vo. 10s. 6d.—Le Scrittore Italiano, per De Porquise, 3s. 6d.—Tales for the Common People, by H. More, N.E., 32mo. 2s. 6d.—Stories for Persons of the Middle Ranks, by H. More, N.E., 32mo. 2s. 6d.—Richard Hooker's Works, 3 vols. 8vo. 18s.—Hartley's Wine and Spirit Merchant's Companion, 2d edition, fcap. 5s.—Emma Roberts's East India Voyager, post 8vo. 7s. 6d.—Roscoe's Digest of the Law of Evidence at Nisi Prius, 5th edition, 12mo. 22s.—Guy's Complete Treatise on Book-Keeping, 1s.—Guy's First Arithmetic, 12mo. 1s. 3d.—Cobbins's Condensed Commentary, 2d edit., imperial 8vo. 38s.—The Arabian Nights in Arabic, by W. H. Macnaghten, Vol. I. royal 8vo. 30s.—The Arabian Nights, translated by H. Torrens, Vol. I. 8vo. 10s. 6d.—Military Law Authorities, by Major W. Hough, 8vo. 8s.—Travels in Western India, by the late Lieutenant-colonel J. Tod, 4to. 3l. 13s. 6d.

CHARLES HENRY ADAMS.

TO CORRESPONDENTS.

* We beg to point the attention of our readers in the western and northern parts of England, to Mr. Willmer's advertisement, which heads our first column. The rapidity with which the *Literary Gazette* is now circulated in distant parts of the country, including Edinburgh and Dublin, each in twenty-four hours, is a great accession in union with its original design and editorial system. Professing to give, from week to week, the earliest, as well as the most comprehensive accounts of novelties in Literature, Science, and the Arts, it comes excellently in aid of its exertions in these respects, to have its Nos. thus hastened, as if on wings, to every remote corner of Great Britain. With regard to India, America, and foreign lands, steamers perform similar services; and the speed of communication is not only a remarkable circumstance in the progress of society, but a matter highly advantageous to the best interests of England.

The "Guernsey Star" is, we observe, very wroth with us for having, as it supposes, thrown a slur upon Guernsey wine in our review of Roze's "Life of Lord de Saumarez" (10th November, ult.); and asserts that the best Bordeaux of the best vintages are (on the contrary) to be obtained from Guernsey merchants. It may be so, but we have not seen it; but if it will pacify the "Star," we will acknowledge having drank very good liquor from that Isle, to which we should like well to pay a visit, and enjoy its good things.

Will J. F. M. W. communicate with us, and enlighten our darkness as to the actual U.M?

"To J. P."—We cannot publish lines which have appeared in another journal. Original poetry is treated according to our opinion of its merits and opportunities.

We are much obliged by the lines on Heidelberg Castle, but fear we may not be able to insert them.

ADVERTISEMENTS.

Connected with Literature and the Arts.

EARLY DELIVERY OF THE LITERARY GAZETTE, IN LIVERPOOL.

THE Subscribers to this popular Literary

Work, and the Public in general, are informed that on and after Saturday next, 25th July, it will be delivered in any part of Liverpool and its Neighbourhood on a Saturday Afternoon,

By EDWARD WILLIAMS, Express London Newspaper Office, Church Street, July 24, 1839.

BRITISH INSTITUTION,

FALL MAIL. The Gallery, with a Selection of Pictures by Ancient Masters of the Italian, Spanish, Flemish, Dutch, and French Schools, is open daily, from Ten to the Morning until Half in the Evening. Admission, 1s. Catalogue, 1s. WILLIAM BARNARD, Keeper.

MR. MOON, of No. 20 Threadneedle Street, who has no connexion whatever with any other publishing House in London, begs to caution his Friends and the Public against an spurious Publication, purporting to represent the Waterloo Heroes at Aspley House, celebrating the Anniversary of the great Battle.

Mr. Salt alone has been authorized by his Grace the Duke of Wellington to paint the Waterloo Banquet, at Aspley House; and for this purpose he has been afforded every facility by his Grace, and by the Commander-in-Chief, and by upwards of Seventy Officers, who have expressly sat to Mr. Salt for their Portraits.

OPIUM TRADE.—The sum of 100l.

has been transmitted from Canton by the Editor of the Chinese Repository to the Committee for the Diffusion of Useful Knowledge, for the best Essay on the Opium Trade, shewing its Effects on the Commercial, Political, and Moral Interests of the Nations, and Individuals concerned therewith, and pointing out the course which ought to be pursued in regard to it.

Each Manuscript Essay contending for the Prize must contain as much matter as forty, and not more matter than one hundred octavo pages of the type of the "Edinburgh Review"; and must be sent to the Secretary of the Society on or before the 1st January, 1841, envelope free; with a sealed Envelope containing the name of the Author, and bearing a mark or motto corresponding with one upon the Essay. 50 Lincoln's Inn Fields, 23d July, 1839. THOMAS COATES, Secretary.

OFFICE OF REGISTRY OF DESIGNS, 346 WELLINGTON STREET, STRAND, NORTH.

NOTICE is hereby given, that Designs will be received for Registration, in pursuance of the Design Copyright Act (3 Vic. c. 17), at the above Office every day, excepting Saturdays, between the hours of 11 in the Morning and 8 in the Afternoon. July 17th, 1839. F. B. LONG, Registrar.

BIRMINGHAM.—The Plan of this Town,

published in the Series of the Society's Maps, may be had at the Society's Office, coloured and mounted, price 2s. SWITZERLAND.—The Society's Map, mounted and coloured, 2s.

IRELAND, mounted and coloured, price 4s. 50 Lincoln's Inn Fields, 23d July, 1839.

London: Longman, Orme, and Co.; T. Cadell; Baldwin and Co.; J. Booth; Dalau and Co.; Whittaker and Co.; Simpkin and Co.; J. Boush; Dalau and Co.; Black and Co.; J. Maynard; J. Wacey; and C. Dolman.

PRODOMUS; or, an Inquiry into the First Principles of Reasoning, including an Analysis of the Human Mind.
By Sir GRAVES CHAMNEY HAUGHTON, K.H. M.A. F.R.S. &c. &c. Member of the Institute of France, &c. &c.
"All men are as the vulgar in what they do not understand."
—*Burke*.
"It is a work which, if men will take the trouble to think, must make a powerful sensation. We trust that the attention of every philosophical inquirer, at home and abroad, will be directed to its earnest and mature examination."—*Literary Gazette*.
"We strongly recommend 'Prodomus' to the attention of our readers, as decidedly one of the best books for its size that has come from the press on this subject for very many years."—*Atlas*.

Also, by the same Author, price 2s.
A Short Inquiry into the Nature of Language, with a view to ascertain the original Meanings of Sanscrit Prepositions; elucidated by Comparisons with the Greek and Latin.
London: Wm. H. Allen and Co. 7 Leadenhall Street.

Published under the Superintendence of the Council of the Natural History Society.

A FLORA OF LIVERPOOL.
By T. B. HALL, Corr. Mem. Soc. Soc. Lond.
With an engraved Map, comprising a distance of Ten Miles round Liverpool; and an Appendix, containing Meteorological Tables and Observations for the Year 1822.
By WILSON ARMISTEAD.
The Phænogamous Plants, amounting to above 500, are arranged in their natural orders, each Genus having the Linnæan Class and Order prefixed, and the Ferns and their Allies are included, making altogether about 600 Species; for which the stations, where necessary, are accurately described, and comprise both the Lancashire and Cheshire coasts. A concise account of the Geological Features of the Neighbourhood of Liverpool, by the Rev. Thomas Dwyer, M.A. accompanies the work, in which the recent important discoveries of the footprints of extinct animals in the New Red Sandstone, at the Storston Hill Quarries, are noticed.
London: Whittaker and Co. Ave Maria Lane. Liverpool: Walsley, Church Street; and T. Hodgson, Lord Street.
Price 6s. If procured of the members of the Liverpool Natural History Society, 4s.

THE COURT AND LADY'S MAGAZINE,
No. XXI. for August, is embellished with an authentic coloured (full length) Portrait of Henrietta Stuart, Duchess of Orleans, youngest daughter of Charles I. of England.
Contents:—

1. Memoir of the Duchess of Orleans—extraordinary details of her sudden death (supposed by poison), in her 27th year, significant circumstances and circumstances of her death.
 2. Expectation, from Victor Hugo.
 3. News from Barcelona. A.S. 1790.
 4. River Excursion. No. I.
 5. A Sketch of Thiers.
 6. Stanzas—The Polish Emigrant.
 7. Passages in the Life of an Irish Private Tutor.
 8. Her Majesty's Theatre—Critical Analysis of Guillaume Tell—Tallard at the Elfenstein.
 9. Zakhia, the Daughter of the Desert; an Episode of the Vicereignty of Mehmet Ali.
 10. The difficulty of forming a correct judgment on Painting demonstrated from the theory of the Art. By Professor Carlo Fepoli, of the Academy of Fine Arts, Bologna, Rome, &c.; with illustrative Critique upon Exhibition of Old Pictures at the British Institution.
 11. Paris Correspondent's Monthly Letter.
 12. Court News and Fashion.
 13. The late Tiding for the approaching Tournament in Ayrshire. Exhibitions, Concours, &c. &c.
- Reviews of New Works. Marriage Double-Registration Index. Dobbs and Co. 11 Carey Street, and of all Booksellers.

VOYAGE du JEUNE ANACHARSIS en GRECE, dans le milieu du Quatrième Siècle avant l'Ère Chrétienne. Abrégé de l'Ouvrage original de l'Abbé Barthélemy, à l'Usage de la Jeunesse, avec l'Aide de l'Auteur, & Par M. LE DUC DE VERNONNOIS;
Revue et soigneusement corrigée
Par NICHOLAS WANDROUCH.
A Londres: chez M. G. D. de la Harpe; chez M. Longman, Orme, et Co.; Delau et Co.; Whittaker et Co.; Simpkin, Marshall, et Co.; Harvey et Darton; J. Souter; Hamilton, Adams, et Co.; J. Wacey; et Houlston et Stoneman.

THE RHINE: Legends, Traditions, and History.
By JOSEPH SNOWE, Esq.
In 2 vols. 8vo. with numerous Illustrations in Wood and Zinograph.

A PANORAMIC MAP OF THE RHINE,
Eight Feet long, on which the Traveller may distinguish every interesting Spot.
London: F. C. Wepley; and J. Madden and Co.

MR. ROBERTSON'S NEW WORK.
In 2 vols. post 8vo.
SOLOMON SEESA W.
With Illustrative Etchings.
By the Senior Author of "Letters on Paraguay."
"A faithful and spirited picture of real life. The style is lively and good, and the sketches and engravings, in the manner of Pickwick, are excellent."—*Bell's Messenger*.
"It is altogether a clever production, happily illustrated by this. The volumes are written throughout in a humorous spirit, and it is but justice to Mr. Robertson to say that his scenes are amusing and laughable in a high degree."—*Observer*.
Saunders and Otley, Publishers, Conduit Street.
Agents—for Ireland, J. Cumming, Dublin; for Scotland, Bell and Bradfute, Edinburgh.

LETTERS FROM GERMANY AND BELGIUM.
By an AUTUMN TOURIST.
London: Simpkin, Marshall, and Co.

THE WILD SPORTS OF SOUTH AFRICA, being a Narrative of an Expedition from the Cape of Good Hope to the Tropic of Capricorn; interspersed with Sporting Adventures during the Chase of the Lion, Wild Buffalo, Ostrich, Rhinoceros, Hippopotamus, Elephant, and Giraffe.
By Captain W. C. HARRIS, E.I.C. Engineer.
John Murray, Albemarle Street.

In 5 vols. fcap 8vo. price 30s. cloth.
A SERIES OF MEMOIRS OF THE STATESMEN OF THE ENGLISH COMMONWEALTH, commencing with the origin of the popular struggle in the Reign of James I. and closing at the Restoration. With original Portraits of Eliot, Pym, Hampden, Cromwell; and a Historical Scene, after a Picture by Catermole.

By JOHN FORSTER, Esq., of the Inner Temple.
"This chain of biographies may be considered as constituting a complete narrative of the most extraordinary and eventful period in the history of England. We regard them as additions of the very highest value to what we may term our political literature."—*Morning Chronicle*.
"The above are comprised in the 2d, 3d, 4th, 5th, and 7th volumes of the series of 'Lives of Eminent British Statesmen,' in Dr. Lardner's 'Cabinet Cyclopædia.'"
London: Longman, Orme, and Co.; and John Taylor.

In 12mo. price 2s. 6d. cloth.
NEW ETON LATIN GRAMMAR; or, the Eton Latin Grammar as it is used at Eton, and also in English: with Introductory Lessons and Exercises, Rules for Construing, Translating, and the Position of Words, Marks of Quantity, &c.
By C. MOODY,
Of Magdalen Hall, Oxford, and lately one of the Masters of Tunbridge School.

"Clear and accurate. The best guide to the young scholar, and of great service to those more advanced."—*Genl's Mag.*
"Certainly superior to the common Eton Grammar."—*Church of England Mag.*
Nearly ready, by the same Editor,
The New Eton Greek Grammar, on the same plan.
London: Longman, Orme, and Co.

10th Edition, 8s. 6d. bound.
THE ETON LATIN GRAMMAR AC-CENTED, with the addition of Notes; and also of the Accents and Quantity.
By T. W. C. EDWARDS, M.A.

- By the same Author,
1. **The Accidence, with the Stress and Quantities correctly marked.** 6th edition, 1s. bound.
2. **Latin Dialects; or, First Lessons in Construing, adapted to the Rules of Syntax of the Eton Latin Grammar.** 7th edit. 2s. 6d. bound.
3. **A Key to Ditto, 4s. boards.**

A GREEK LEXICON to the NEW TESTAMENT, on the basis of Dr. Robinson's, designed for Junior Students in Divinity, and the higher Classes in Schools.

By CHARLES ROBSON, Typographer.
 "For learned readers, and those who can compare the Hebrew lexicons from which they (the peculiarities in the style of the New Testament) have been drawn, various lexicons exist; but for those as yet unacquainted with Scripture criticism, no sufficient aid had been afforded until attempted in the present work. . . . We conclude by heartily wishing success to this Lexicon."
Literary Gazette, July 20.

Whittaker and Co. Ave Maria Lane.

FOR THE USE OF SCHOOLS.
 In 18mo. price 7s. 6d. bound, the 4th edition of **EXCERPTA ex VARIS ROMANIS**

8 New Burlington Street, July 26.
M. R. BENTLEY has just published the following NEW BOOKS:—

The Hon. C. A. Murray's Travels in North America.

During the Years 1834, 1835, and 1836. Dedicated, by special permission, to the Queen. 2 vols. 8vo. with Plates.

Hamilton King.

By M. H. Parker, Esq. ("The Old Sailor"), Author of "Land and Sea Tales," "Tough Yarns," &c. 3 vols.

History of the Reign of Ferdinand and Isabella, the Catholic, of Spain.

By W. H. Prescott, Esq. 2d edition, revised, 2 vols. 8vo. with Portraits of Columbus, Cardinal Ximenes, Goncalves de Cordova, and (now first added) Ferdinand and Isabella.

Captain Chamier's Life of a Sailor.

Complete in Shilling's new series, **THE NEW VOLUME OF BENTLEY'S STANDARD LIBRARY.**

"Without exception the most animated, graphic, and lifelike picture of maritime adventure, that has ever yet been drawn. Even Smollett, replete with nature, observation, and genuine humour, as his sea-sketches are, must yield in point of real interest to the work before us. It is at once a book of maritime travel, a novel, a biography, and a romance."—*Scotsman*.
 Richard Bentley, New Burlington Street, Publisher in Ordinary to Her Majesty.

THE CARTHUSIAN (completed), Nos. V. and VI. with Four Plans.

REVIEW OF NEW BOOKS.

Travels in Western India, embracing a Visit to the Sacred Mounts of the Jains, and the most celebrated Shrines of Hindu Faith between Rajpootana and the Indus; with an Account of the Ancient City of Nehrwalla. By the late Lieut.-Col. James Tod, author of "Annals of Rajast'han." Royal 4to. pp. 518. London, 1839. Allen and Co.

THIS work, which has been unavoidably delayed till we read the melancholy words "*the late*" upon its title-page, and applied to its estimable author, is nevertheless quite, or very nearly as complete as it was left by his hand. In 1829 and 1832 appeared his two splendid and interesting volumes, the "Annals of Rajast'han"—(see *Lit. Gazette* of these years)—volumes which opened our eyes to more of the ancient history and early arts, commerce, and relations of this important division of the great peninsula than it had been previously conceived to be possible to rescue from the oblivion of ages. Ruins, records, inscriptions, traditions, coins, were all brought forward, investigated, and discussed; and the new lights which these threw, not only upon Hindu affairs, but upon the connexion of the countries with Greek, Roman, Arabian, and Scythian invasions and intercourse, were of a nature to create a very lively sensation, and originate those inquiries which have since added so much to our historical and geographical information.* As a sequel to the "Annals," the present publication takes its place among the most valuable contributions, to our knowledge of India; and fully confirms the claim of its writer to be ranked among the highest and most original authorities who have devoted their time, talents, and learning, to the elucidation of the many important subjects involved in Oriental researches. Truly does Col. Tod speak of his labours when he says, in a fragment of MS. left by him, "Heart and soul did I labour for the one, and with the same idolatrous affection for the subject have I given up every pursuit, every thought, to this, in the hope of making the Rajpoots known by their works. The scene is removed; but I linger awhile in the skirts of Rajpootana, to lead my reader into the hardly less interesting region of Saurashtra, and to the mounts, as sacred to the monotheistic Jain as were Gerazim or Sinai to the Israelite."

A memoir of the author, describing the noble services he performed in Rajast'han, and in contributing to the overthrow of the Pindarries, those cruel devastators of the fairest regions of Western India, is prefixed to these "Travels."† The first twenty-two years of the present century he spent in that service, eighteen of them among the fine race of Rajpoots, and five in the discharge of the highest functions of government; and, during the whole of that period, endeared himself to the natives of all classes, whilst he effectually promoted the

best interests of the English Empire. In this memoir we find the following summary of universal interest, as exposing the first steps towards, and the foundations of, subsequent inquiries into the antiquities of the land:—

"Before the successful researches of Col. Tod, no dogma was more generally acknowledged, than that the Hindus had no native history; though it was naturally and pointedly asked, 'If the Hindus have no history, where did the Mahomedans discover the facts which are recorded by Abulfazl?' The course pursued by Colonel Tod, in exploring the historical works of the Rajpoots, is described in the Introduction to the first volume of his 'Annals of Rajast'han.' He appears to have had unrestricted access not only to the archives of the princes, but to the immense libraries of the Jain sect (of which his guru, or preceptor, was a learned member), which appear to have escaped the scrutiny of the Mahomedans, from whence he was permitted to bring away MSS. of considerable value: these are deposited in the library of the Royal Asiatic Society. The rana of Méwar allowed him to borrow from his archives those sacred volumes, the 'Puranas,' from whence he deduced the genealogy of the Rajpoot tribes. Raja Maun, of Marwar, a man of literary taste, and remarkably well read, had copies made for him of the principal histories of his family, which are likewise deposited in the Society's library. The 'Book of the Johyas,' a race of Jits, occupying one of the districts of Bikanér (amongst whom some traditions of Alexander the Great are preserved), was sent him by the prime minister of Jessulmér. Amongst other valuable historical works obtained by him in the country, may be mentioned the poems of Chund, the Rajpoot Homer (or rather Ossian), of which Colonel Tod possessed the most complete copy extant, and which are esteemed authentic history; and various Charitras, particularly the 'Komarpal Charitra,' or history of Anhulwara, from whence he has incorporated copious extracts into this work. No subsidiary aids were neglected; he was indefatigable in his search for inscriptions, grants, coins, and other similar records, which are the most irrefragable of historical documents. In the course of these researches, he discovered (on his homeward journey), at Puttun Somnath, on the coast of Saurashtra, an inscription, in the Devanagari character, which not only fixed the era of the Balhara kings of Nehrwalla, but disclosed a peculiar era, the Balabhi Samvat. His skill in deciphering dates concealed, or rather secured from sophistication, in the cryptographic form, was of great advantage at a time when the art was by no means extensively known, even among the pundits of India. 'Many inscriptions,' he observes, 'have been passed by me as useless, from their not containing the date in numerals; nor was it until the last years of my researches that my yati (preceptor), through the medium of the prime, and some more learned of his sect (the Jain), solved this difficulty, as well as the enigmatical character of several of these inscriptions.' Colonel Tod was the first to make known in Europe this peculiar system, which has since been fully developed by M. von

Schlegel, M. Csoma de Koros, and Mr. James Prinsep. Nor were his archaeological investigations exclusively limited to purely Hindu antiquities. His discoveries of Bactrian and Indo-Grecian coins, of which he accumulated a considerable number,* and his learned and accurate illustrations of them, initiated the study of a branch of numismatic science which has since produced important results. The biography of Colonel Tod is now taken up in the work which is in the hands of the reader, wherein he relates the cause of his quitting India; the reason why, notwithstanding the reduced state of his health, instead of proceeding directly to the nearest sea-port, he commenced a circuitous journey of discovery (the motives to which are highly characteristic of his distinguished zeal in the cause of science), the scenes and objects he met with, and the incidents which attended this journey. It will be sufficient to say, that he bade farewell to the capital of Méwar on the 1st June, 1822, arrived at Bombay on the 14th January, 1823, and in the following month embarked for England. A long interval of uninterrupted tranquillity and repose should have been allowed to repair the wear which body and mind had undergone during so many years of excitement in an enfeebling climate; but his generous purpose was incomplete until he had imparted to the world the knowledge he had gained, and until he had made 'his Rajpoots,' as he affectionately termed them, known to the people of Europe. Instead of carefully nursing his health, he applied himself eagerly to the arrangement of the immense mass of materials he had accumulated† for his meditated work, which demanded incessant toil and study. The consequence of thus overtaxing his physical powers was, that, in 1825, his labours were interrupted by an attack of the same character as that which, ten years later, terminated his valuable life."

We now address ourselves to the *Travels*, of which the author says:—

"First, I determined to cross the alpine Aravulli, in my route to the Olympus of India, the celebrated Aboo, in one of the lines of its greatest breadth, either through the independent Bhil communities of Ogunah Panurwa, or by the more intricate region, the source of the Bunas river, said to be the highest point of this grand mountainous range. Secondly, to descend its northern declivity to Marwar, and skirting this magnificent hem of the desert, penetrate by Sirohi to Aboo. Various reasons combined to recommend the latter course, in preference to an object of no small interest, that of visiting those aboriginal communities, which have long been isolated, geographically and politically, from all other societies. So far back as 1808, one of my parties had traversed these tracts, and brought me accounts of their primitive and independent condition, which

* "These he bequeathed by will to the Royal Asiatic Society."

† "His collection of MSS., coins, and antiquities, the most valuable of which were presented to the India House or the Royal Asiatic Society, were subjected to heavy duties and charges in this country; and there is amongst his papers a list of these articles, with the charges upon them paid by him, amounting to 72*l.*, headed, in his hand-writing, 'Encouragement to Oriental literature.'"

* Especially by Mr. James Prinsep, for whose discovery of the name of Antiochus the Greek in Girnar inscriptions, and other antiquarian proceedings of the Asiatic Society of Bengal, see *Lit. Gazette* of the present year: the publications of Schlegel and C. de Koros may be advantageously consulted.

† At page 1, there is apparently a mistake in the date. It is stated that he retired from the service in June 1825, and yet his lieut.-colonelcy is of June 1826, a year later.

made me eager to visit them. It was in this impervious region that the arrow from a quiver of a deceased son of the forest, given by his widow, served my messenger as a passport through its otherwise inaccessible valleys. In exchange, however, I was to see the defiles where the Ranas circumvented and destroyed their Mogul oppressors; the sources of the Bunas; and at the pass of Sadri, near that by which I intended to debouch into the plains, the celebrated Jain temple of Rainpoor. At the same time I despatched a party, on whose intelligence and sagacity I could rely, to traverse the other route, and meet me at Aboo. These objects, which had found a daily place in my meditations for many years, were at length within my grasp. Well do I recollect when, for the first time, in 1806, Aboo had a niche in my map. I was then in search of the source of the Bunas river, which we had more than once crossed in our route to Sindia's camp in that year; when, to my inquiries as to its fountains, I was told, 'They were far away amongst the hills towards Aboo.' 'And where was Aboo?' 'Thirty coss westward from Oodiper, towards Sinde.' Down went Aboo with the Bunas on my map; and this first step made, I gradually attained its source, the summit of Aboo, and, within a few hours' sail, the Indus itself. Between these points, the first and the last of my present journey, I had chalked out many intermediate objects of the deepest interest. After the passage of the Aravalli, and the exploration of Aboo, my intention was to discover what remained of the ancient Nehrvala, the Tyre of western India; thence to trace the site of Balabhi, for the purpose of verifying the traditions of the Rana's family. As this would lead me by the Gulf of Cambay to the shores of the Saurashtra peninsula, I resolved to effect, if possible, a visit to the sacred mounds of the Jains, the cradle and still the stronghold of their faith, viz. Palit'hana and Girnar; and to conclude my pilgrimage in the Syria of India by a visit to the shrine of its Baal and that of Krishna, at Dwarka, the land's end (juggut coont) of the Hindus. Thence, by the Pirates' Isle, Bét, cross the Gulf of Cutch, make an excursion to Bhoj, the capital of the Jharéjas, return to the grand mart, Mandavia, sail on to the eastern arm of the Indus, and visit the last shrines of Hinduism at its embouchure with the ocean. All this I accomplished, save the last object, which seventeen hours of fair wind would have effected: but for ample reasons, which will appear in the sequel, I was obliged to stretch my sail across the ocean to Bombay, instead of coasting to the terminating scene of Alexander's exploits in India. With this previous exposition, I shall now request my reader to strike his tent, and begin his march with me from Oodipoor."

In his progress he states of the *Bhils*:—
"The tract called Khuruk, of which Jowas is the capital, touches Dongerpoor and Saloombra, whose chiefs are at constant enmity with their inhabitants. Enveloped by lofty hills, covered with deep forests, chiefly of bamboo and dhak (*butea frondosa*), successful invasion is impracticable with numbers, and a few would be cut off, unless they took them by surprise. Death is the lot of any who dare to cut a tree in the paths of outlet. Fire-arms are only used by the chiefs and head-men; the national weapon being the kumpta, or bamboo bow, having the bowstring (chulla) from a thin slip of its elastic bark. Each quiver contains sixty barbed arrows, a yard long. Although they claim descent from every race of Rajpoot, and prefix

the tribe, as Chohan-Bhil, Gehlote-Bhil, Prammar-Bhil, &c. &c., their origin is best evinced in the gods they worship and their prejudices as to food. They will eat of nothing white in colour, as a white sheep or goat; and their grand adjuration is, 'By the white ram!' These prejudices, however, belong only to those who affect to call themselves Oojla, or pure Bhils; and, if we may judge by the freedom from prejudice of the greater number, few are entitled to the distinction of 'pure.' In fact, we may assert that they are still demi-savage, as they are assuredly an aboriginal race, whether we regard their superstitions, their habits, or their language; for although the latter contains much of Sanscrit derivation, their vocabularies are distinct. I advance this, however, more from the report of their neighbours than from personal investigation—a Bhil vocabulary remaining amongst my desiderata. Had I explored the haunts described above, I should certainly have made some acquisitions of this kind, as well as gained a more extended knowledge of their habits, amongst the Lares and Penates, the 'white ram,' and aswa-mukhi, or horse's head (the grand symbols of adoration), at their own firesides. This study will amply repay those who are desirous to read the book of nature under every aspect; and the inquirer will be surprised and gratified to prove the truth of the old axiom, 'extremes meet.' Here, in the abodes of savage, uneducated nature, he would form an acquaintance with the virtues of truth, hospitality, and that proud distinction, gradually disappearing from the European codes, which provides a sanctuary for the refugee. If a Bhil pledges protection, he will sacrifice his life to redeem his word; if the traveller through his passes pay the customary toll, his property and person are secure; and any insult or injury by another will be avenged. The password, Maula-ca-sirna, or the Sanctuary of Maula, or whatever other name the protector may bear, would be a safeguard from one end of the community to the other; and if his protector did not furnish him with a guide, an arrow from his quiver would answer the purpose, and be equally recognised with the ambassador's signet of any court in Christendom. Nor would he, like the mountain Afghan, perform the rites of hospitality while under the eye of the Penates, yet hesitate not to plunder its object so soon as he had passed a decent distance from his roof. The historian of America observes, that 'nations which depend upon hunting are in a great measure strangers to the idea of property; and with the natives of those regions, the forest or hunting grounds were the property of the tribe.' The Bhil is a step in advance in the scale of civilisation, their hunting grounds being separated into individual portions, as the following anecdote, which I noted down many years ago, will attest. The Bhils of the most desolate and unfrequented wilds of M'war and the Nerbudda to this day lead a life little short of that of nature, and with the exception of a few articles of luxury, resulting from the discovery of fire, as roasted vermin and distilled waters, are not more civilised than the Esquimaux on the verge of the Polar Basin, to whom a piece of putrid blubber is not less a delicacy than a roasted guano or jackal to the Bhil. These are delicacies to the Vanaputra table, supplied by the spontaneous and abundant fruits of the forest, such as nourished the forefathers of the heroes of Marathon and Thermopylae; but our Bhil has a more varied and palatable repast than their acorn dinner, viz. the ebony, tamarind, mango, and many other fruits, besides the seeds of various wild grapes,

and esculent roots: though he is not always permitted to apply these to his own use, free from the claims of other dwellers in the forest, the bear and the monkey. But now to our anecdote. 'Go,' says the father Bhil to the suitor for his daughter's hand, 'I resign yonder mountains as her daseja (dower), nor shall I henceforth within its bounds entrap hare or fox, pluck its fruits or roots, or its branches or leaves for fuel. All are yours.' The bear does not, however, so readily relinquish his share, but will fight for the possession of his darling mhowa-tree. A young Bhil had fallen asleep beside his basket, filled with its fruit, either intended for the family dessert, or to be converted into aruc ('essence'—the whisky of the East), when a bear, in his rounds, roused him, somewhat rudely, from his slumbers, and prepared apparently to make his repast on the Bhil, who escaped much lacerated from his embrace. Such an infraction of sylvan polity was not to be borne by the father Bhil, who sallied forth with bow and arrow to avenge the insult. He found the bear feasting on the scene of aggression, slew him, and carried his skin to a neighbouring chief, to whom his feat was due; and on telling the story, thus concluded his harangue: 'There is the hide of the offender; it is hard that brothers of the forest cannot live on terms of friendship:—but he began the war.' 'If,' as observed by the celebrated Goguet (vol. i. p. 78), 'there has always been a great conformity between the ordinary food of men and their sacrifices, who have always offered to the gods a part of those things which were the chief support of their own lives, as in the first ages, herbs, fruits, and plants, and at length animals, when they became their ordinary food,' the legitimate inference would be, that human sacrifices and cannibalism were co-existent; but although we have on record that the Hindu, as well as the ancient Briton, offered human sacrifices to the Destroyer, we have no authority for the belief that the votaries either of the Celtic Belenus or Hindu Bal participated in such food to their gods. It is true that we might cite the brutalised Aghori as a proof of still existing cannibalism; but he would only prove the exception to the rule. Yet, though this proof of the last stage of human degradation be wanting,—the very lowest dweller in these forests,—we may not resist the suspicion that the stomach which does not revolt at making its repast on an offal-feeding jackal, hideous guano, or half-putrid kine, would not find the transition to a human limb very objectionable.

"Our aborigines of India, the Bhil, Koli, and Goand, had, doubtless, found the art of cooking their food at a very early period, having a natural tinder-box and flint in every bamboo grove, and having only to watch, during a high wind, the emission of flame from the friction of these natives of the hills, to obtain a supply more than sufficient of the devouring element: their sylvan retreats being often burnt over their heads. I have witnessed the magnificent spectacle of a forest of bamboo blazing, crackling, and exploding, said to be self-ignited; and although any hard wood will yield fire by friction, the siliceous coating of the bamboo makes it by far the most ready instrument of Agni, whom the universal Hindu nation, the learned Brahmin, the warlike Rajpoot, as well as the half-savage Vanaputra, worship as a divinity. A thorough study of the uncivilised tribes of India, the Bhil, Koli, Goand, Meena, Mair, would disclose important links in the physical history of man; even in those enumerated, the most powerful distinctions, as well in form

and lineament, as in habits and superstitious rites, the result of example or locality, would be observed; and though all alike bear the impress of originality, yet their respective characteristics are so dissimilar, that we should reject the idea of their common descent from one great family. There is not a greater difference between the squat, flat-nosed, Tartarian-*viaged* Esquimaux, and the ancient noble Mohican savage, than between the Bhil of Méwar and the Khole of Sirgoejur; nor are the habits of the dweller on the verge of the Polar sea more distinct from those of the migratory races of the Missouri, than are those of our forest *indigènes* from the more locomotive Rajpoot. If man had sprung, like a fungus, from the earth, it might be said these were the uncultivated mushrooms of India, fixed, as the rocks and trees of their mountain wilds, to the spot that gave them birth. The entire want of the organ of locomotion, and as unconquerable indolence of character, which seems to possess no portion of that hardness which can brave the dangers of migration, forbid all idea of their foreign origin, and would rather incline us to the Monbodo theory, that they are an improvement of the tribe with tails. I do not reckon that their raids from their jungle abodes, in search of plunder, supply any argument against the innate principle of locality. The Bhil returns to it as truly as does the needle to the north; nor could the idea enter his mind of seeking other regions for a domicile. Their very names imply this principle:—Vanaputra, 'child of the forest;' Malrota, 'born of the mountain,'—Goind, apparently a compound of Gopa and Indra, 'lord of the cave;' Pal-Indra, 'lord of the pass.' In like manner, Kol, signifying 'mountaineer,' from Ko, 'a mountain,' which, though less commonly used than the Sanscrit word Gir, is beyond a doubt a primitive root with the Indo-Scythic nation. The Bhils, having no order of priesthood, have recourse to the Guru of the Bullaes, one of the most debased of the Sudra classes. On the occasion of any nuptial ceremony, this Guru decks himself in the sacerdotal thread of the Brahmin, whose appellation he assumes with the badge, though he partakes both of the food which is dressed and of the cup which flows freely. A scene of riot follows every such rite, and a general fray is the never-failing *finale*. Whatever daja, or dowry, is given with the bride, the bridegroom invariably presents the father with a buffalo, twelve rupees, and two bottles of liquor, to defray the marriage-feast. On a birth, the same self-created Brahmin names the child, generally after the genius presiding over the day of its birth; Boodh, if born on Wednesday, from Boodh-war, or the day of Mercury; or Boodhia if a female. On this event, as well as on deaths, there is another very important character called in to take part in the ceremony, the Camra, or minstrel, of whom there is one in every large village. His garb is that of the Jogi ascetic, and as it is necessary he should be initiated in the mystical doctrines of the sectarian Kabri, he is indifferently named Kamra Jogi, or Kabri Punt. On births, accompanied by his wife, he takes his position with his guitar before the door, first placing a small figure of a horse beside the threshold. He then commences a hymn, propitiating Seetla Mata, the protectress of infants, who is much dreaded by all the wild tribes, his wife blending her voice with his, and beating time with the cymbals. A large d'hol, or alarum-drum, is kept in every village, which by a peculiar beat announces such an event to

the neighbours, who, according to their ability and inclination, present gifts to the parents of the new-comer. On deaths, a monotonous beating summons the neighbours, each of whom brings in his hand a seer of grain. Close by the door of the deceased the minstrel takes his post, the image of the horse and an earthen jar of water being placed beside him. Each relation and visitor, on approaching, takes some of the water in the palm of his hand, which he sprinkles over the image, invoking the name of the deceased, and presenting the measure of grain to the minstrel. Why such reverence is shewn to the emblem of the horse, I have been unable to learn—unless it be as the symbol of the sun, adored by all classes—but nothing is undertaken without it."

This curious account of the Bhils is followed by another of the *Saireas*, but we can only refer to it, and to further particulars concerning various Rajpoot tribes, including *Deoras*, among whom our countryman rested awhile. Passing from them he writes:—

"At length we reached the skirt of the gigantic Aboo, and encamped on the fringe of his garment. To exist for twenty-four hours in such a position, contemplating the steep we were to climb, required an exercise of patience. The day was passed in preparation for scaling the Hindu Olympus, an enterprise not to be attempted without invoking the aid of Boodh, or Wisdom. The Rao sent forty sturdy mountaineers to transport me with my party to the summit. They were furnished with two vehicles, called Indra-vahana, or celestial cars, consisting of a couple of long bamboo poles, from the centre of which was suspended a small seat, about a foot square, by help of which alone the indolent or infirm pilgrim could attain the 'Mount of Wisdom.' Not being in robust health, I was far from sorry to see such aid at hand; the other was appropriated to my Guru, who was determined to accompany me on my pilgrimage to all the shrines of his faith. Thus the day passed in conversing with the children of Arbudha, or gazing on the gigantic object, till the shades of night threw a mysterious darkness around it. The jackal had set up his howl, and the fox his shrill bark, denoting their time for preying on the defenceless dwellers in the forest; and with such music, almost unheeded from its frequency, I took to my pallet, to prepare for an alert on the morrow."

The ascent o'ermastered, with a striking and magnificent picture, the narrative continues:—

"The sun had reached his meridian career when we attained the summit of the Guru Sikra, the loftiest of the peaks of Aboo, where European feet had never trod. Although presenting, externally, scarcely any sensible elevation above the crest of the mountain, as we approached through the plains of Marwar, it towered full 700 feet above the level of its plateau; still my sluggish barometer only indicated 15° of elevation, being 27° 10', while the thermometer, exposed to the sun in the dog-days of India, and within the tropic, fell to 72°, and proved the better guide. A strong chilling wind blew from the south, to avoid whose influence, the cautious mountaineers, coiling themselves in their black *comlis* (blankets), lay prostrate on the ground, sheltered behind a projecting rock. The picture was equally grand and novel: masses of cloud floated under our feet, through which the sun occasionally darted a ray, as if to prevent our being dazzled with too much glory. A small circular platform, having a low parapet wall on

the outer side, crowned the giddy height. On one side was a cavern, about twenty feet square, within which is a block of granite, bearing the impress of the feet of Data Briga (an incarnation of Vishnu), the grand object of the pilgrim's attainment; and in another corner are the puddas (or footsteps) of Rama Nanda, the great apostle of the Seeta ascetics. In this gloomy abode dwells a disciple of the order, who rings a bell on the approach of a stranger, continuing the uproar till an offering induces silence. The staffs of pilgrims were heaped in piles, around the footsteps of the saint, as memorials of their successful intrepidity. Caves innumerable were seen in various parts of the mountain, indicative of a Troglodyte population in former ages; and there were many curious orbicular holes, which could only be compared to the effect of cannon-shot. I patiently awaited the termination of the struggle between the powers of light and darkness, in conversation with the recluse. He told me, that during the burst, or rainy season, when the atmosphere is cleared of all impurities, the citadel of Jodpoor, and the desert plain, as far as Balotra on the Loony, were visible. It was some time before I could test this assertion, though, during occasional outbreaks of the sun, we discerned the rich valley termed Bheetril, extending to Sarohi; and, nearly twenty miles to the east, the far-famed shrine of Ambā-Bhavanī, amongst the cloud-capped peaks of the Aravalli. At length, however, Surya burst forth in all his majesty, and, chasing away the sable masses, the eye swept over the desert, until vision was lost in the blending of the dark blue vault with the dusky, arid soil. All that was required to form the sublime was at hand; and silence confirmed the charm. If the eye, diverted from the vast abyss beneath, turned but half a circle to the right, it rested on the remains of the castle of the Pramars, whose dusky walls refused to reflect the sunbeams; while the slender palmyra, as if in mockery of their decay, fluttered its ensign-like leaves amidst the ruined courts of a race who once deemed their way eternal. A little further to the right rose the clustering domes of Dailwarra, backed by noble woods, and buttressed on all sides by fantastic pinnacles, shooting, like needles, from the crest of the plateau, on whose surface were seen meandering several rills, pursuing their devious course over the precipitous faces of the mountain. All was contrast—the blue sky and sandy plain, the marble fanes and humble wigwam, the stately woods and rugged rocks. In spite of the cold blast, it required an effort to withdraw from the state of contemplative indolence which overcomes one amidst such scenes, where, as if brought into the immediate presence of the Creator of such grandeur, the mind feels oppressed with its own insignificance.

"I had often," he adds, "witnessed, and more frequently read of, the revolting practices of numbers of the countless inhabitants of India, the slaves of a knavish hierarchy; but it was reserved for me this day to discover the extent to which the debasement of man could be carried without the intervention of priestcraft, and which, happily, was too far below the attributes of human nature to be erected into a system. I allude to the Aghori, who finds a place in the interminable nomenclature of Hindu sectarian classification. I may style this outcast of human nature the jackal of his species; but even this midnight reveller amidst graves and impurities, is cleanly in his habits, compared with the Aghori. The brute would

turn away from putrefaction, and refuse to prey on the dead of his own kind; not so the Aghori, by whom a dead man or a dead dog is viewed with equal indifference, or rather appetite, and, disgusting as is the relation, he does not hesitate to feed on the excretions of nature. I had heard that such wretches did exist, not only in the sacred Aboo, but amidst the impenetrable recesses of the other mounts dedicated to the Jain faith, in the peninsula of the Sauras. The illustrious d'Anville speaks of them as '*une espèce de monstre*,' whose existence he doubted, though quoting from his veracious countryman, Thévenot. He says: 'Thévenot dit avoir vu dans les habitans de ce lieu, un caractère de hardiesse et d'insolence tout extraordinaire, en sorte qu'on soit obligé d'être armé en passant chez eux; apprenant, en même temps, qu'ils étoient peu auparavant de ceux qu'on appelloit Merdi-coura, ou mangeurs d'hommes. Ce qui prouve que le fait n'est pas avancé légèrement par notre voyageur, c'est que le terme de Merdi-coura, qu'il ne parait pas avoir connu autrement que par cette rencontre, se retrouve dans la haute antiquité.' It is a curious fact, as d'Anville adds, that this '*espèce de bête*,' this Merdi-cour, or properly Merdi-khor, should have been noticed by Pliny, Aristotle, and Ctesias, under nearly the same name, Marti-chora, giving its synonym in their own language, '*Ἀνθρωποφάγος*: for Merdi-khor is a Persian compound from merd, 'man,' and khoordun, 'to eat.' Three facts are deducible from this etymology of the Greek writers: first, that this brutalised sect is of ancient date; secondly, that the Persians must have had an intimate intercourse with these regions in early times; and thirdly, that the Western historians must have had more recourse to Persian historians than we at present are aware of. I passed the gopha, or cave, of the most celebrated of these monsters of the present age, who was long the object of terror and loathing to Aboo and its neighbourhood. His name was Futteh Poori, who, after having 'embowelled,' to an advanced age, whatever came in his way, took the extraordinary resolution of immuring himself in his cell. The commands of maniacs generally meet with ready obedience; and, as he was regarded by many in this light, his desire was implicitly fulfilled. The mouth of the cave was built up, and will remain so until some mummy-hunting Frank shall re-open it, or till phrenology form a part of the modern education of a Hindu; when, doubtless, the organ of destruction on the cranium of Futteh Poori will exhibit a high state of development. I was informed that there was still a considerable number of these wretches inhabiting the caverns of the mountain, from which they seldom emerged to open day, but prowled about in search of fruits, or whatever food the Rahtis conveyed to the paths they frequented. One of the Deora chiefs told me that, a very short time since, when conveying the body of his brother to be burnt, one of these monsters crossed the path of the funeral procession, and begged to have the corpse, saying that it 'would make excellent chatni,' or condiment. He added, that they were not actually accused of killing people. It was strange to meet with the cave of a cannibal, if not within the precincts, in the immediate vicinity of the shrines of Jainism, whose first tenet is, 'Thou shalt not kill,'—not man alone, but the smallest sentient being: presenting another anomaly in the history of Hindu superstition, which recognises the grossest incongruities. The orthodox, whether followers of Siva or Vishnu, seem to consider

their respective tenets too stable to fear the contact of other creeds; and even the Jain Unitarian, while he professes devotion to 'the Spirit' alone, does not refuse the homage of a reverence to the symbol of 'Wisdom,' to the beneficent Anapoorna, or Ceres, or the universal 'Destroyer.' Sects and creeds have no martyrs; no relics of saints are required to keep their respective votaries fixed to the principles in which they were born; and the ignorant, the superstitious, the timid, or the humane, may supply food even to the basest of his species, the horrid Aghori. In this tremendous pantheon, no one is called to account for actions not affecting society."

Of the ancestors of the present Rao, we are told of one Soortan, "who, far excelling our Canute in arrogance, 'shot his arrows at the sun, for daring to incommode him.'"

We are sorry that we must turn aside from the descriptions of the prodigious Jain temples with which Col. Tod soon after fell in on his route; but the details are too long for our limited page. The ruins of the capital, Nehrwalah or Anhlwarra,* seem to surpass the powers of language; but the temples of Vrishhabdeva, Parswanath, the city of Chandravati, and other remains, are also extremely rich in architecture and sculpture, which in Col. Tod's opinion, connects their styles with the Saracenic and pointed Gothic, which was afterwards brought hence to Africa and Europe.

"Anhlwarra was the Tyre of India, though not a sea-port; her port being that of Cambay; neither is it improbable that ancient Tyre did contribute to the varied commerce of this city, through which ramified the produce of Africa and Arabia from the remotest times; nor that the mariners of Hiram, the ally and carrier of Solomon, may have found their way to the land of the Sauras—the Syria of India."

Our author proceeds to exhume the history of this great kingdom from the "Komār-pāl Charitra," a work which sketches the dynasties that ruled over it, and examines the anterior title of *Bahara* assumed by its earlier sovereigns, whom he supposes to have been originally from Balk, the Bactria of the Greeks: and he concludes:—

"To some, this meagre chronicle will present little more than a record of ascents to the gādi, and descents to the grave; but those who look beneath the surface, will observe that it contains hints, allusions, names of things as well as persons,—ideas, in short, which, to those who can follow them out, afford valuable matter for all that is styled the philosophy of history—whether on religion and the singular sects of this period; on commerce, and its probable extent with the nations of antiquity; on the migration of tribes; on the arts, especially of architecture, sculpture, numismatics; on war; on geography, political and physical, and the international intercourse of the Rajpoot

... "The sceptic in Scriptural prophecies," it is elsewhere observed, "should repair to the once proud metropolis of the Baharas. He would there just see sufficient of this once magnificent city, with its 'eighty-four squares and eighty-four bazars,' to mark the facility with which capitals are raised and overthrown. He would discern in the vestige of the lofty circumvallation which enclosed the palace of its Cæsars; of the rest, like the walls of Babylon, there is not one stone left upon another. When desertion commences in the East, there is soon nothing remaining but sacred edifices, and the barries, or reservoirs of water. The first object that attracts the eye, is a fragment of the Kall-kote, or inner city, consisting of two strong bastions, called the towers of Kall, from a small shrine of Time underneath, near one of the principal entrances to the city. From the summit of these towers, the eye can trace the course of the walls, which formed an irregular trapezium of perhaps five miles circuit, around which extended, chiefly to the east and south, the suburbs, to which there may have been an external circumvallation."

princes, during a period of eleven hundred years. Our own historians did not find the philosophical deductions and illustrations which constitute the charm of their works, when diving for truth, in the dark chronicles of antiquity: the woof they wove was of divers materials, obtained from many a source, 'the fruit and flower of many a province' in the extended domain of history, in which nothing was overlooked that could contribute to their object. Nor is there wanting in these regions matter applicable to similar purposes, although the staple may be of a quality less likely to stimulate or reward research than that of the country which gave us birth, or the states connected therewith. But, although secondary, the interest to be derived from the pursuit is still of a positive description. To confirm, by inscriptions, the chronological verity of the Charitras, or Annals; and to trace, by the aid of the bardic chronicles, the migrations of tribes from higher Asia, as Getes, Turabkas or Tacshacs, Ballas, Ariaspas, Hooms, Cattis, and others of foreign nomenclature, and their settlement in these regions; to speculate on the varied worship they may have brought from the 'father-land,' and on the changes this underwent from their partial amalgamation with those they displaced, and to discover what yet remains of ancient habits and institutions, are objects presenting no mean scope to the thinking mind, and facilities for such research exist in the peninsula of the Sauras to an extent surpassing, perhaps, any other field of inquiry in India. Here is the very cradle of Buddhism; this is the land which either gave these sectaries birth, or nurtured and sheltered them on their expulsion or migration from other regions. The province of Syrastrane, or region of the sun-worshipping Suaras, which anciently extended from the Cutch Gulf to the delta of Sinde, was only divided from the fire-worshippers of Aria and Bactriana by the Indus, no attuc to the Budhists, whose traditions affirm that their primates were accustomed to cross it long before the appearance of Islam to visit their dioceses in the west. * *

"Further research amidst the wrecks of ancient civilisation and rock-inscriptions, in these unfrequented holy mounts, may yet reveal some secrets. Of architecture, from the different features hitherto found in the Budhist and Jain temples, we may conclude that, if they did not bring its elements with their religion from western Asia, what they adopted has been so modified as to have a distinct style, as is seen in their yet existing monuments, of which I have had the pleasure to present to the world the first specimens. Summary as is the detail of the foreign products imported by the Tyre of India in the eighth century, it affords sufficient ground to assume the extended and long-established commerce which must have obtained these results. * *

"From the foregoing, we shall make one important deduction in this place, the consideration of which may be resumed as we advance into the peninsula of the Sauras, when we have occasion to remark on the religion, the tribes, and the strange characters on rocks and coins, viz. that an extensive commerce was maintained between the Rajpoot sovereigns of Western India, and the shores of Arabia, Egypt, and the Red Sea, at periods long anterior to Christianity; and independently of the evidence of Greek and Roman agents being resident amongst the eighty-four ports of the Baharas, in the second century of the Christian era, we are assured, on undisputed authority, that the Romans remitted to India annually, a

sum equivalent to 400,000*l.*, to pay for their investments; and that, in the reign of the Ptolemies, 125 sail of India shipping were at one time lying in the ports of Mius, Hormus, and Berenice; the ports whence Egypt, Syria, and Rome herself, were supplied with the products of India, and whence the pepper of Malabar found its way into the cell of a monk, during the period of the Saxon Heptarchy."

The ruins of Anbulwarra have been plundered for the building of Ahmedabad and the modern Puttun; but among the relics saved are some remarkable inscriptions, and, more valuable still, a library, to which we shall, in another No., direct our attention.

Anecdotes and Traditions, illustrative of Early English History and Literature, derived from MS. Sources. Edited by William J. Thoms, Esq., F.S.A. 4to. Pp. 134. London, 1839. Printed for the Camden Society.

THIS, the fifth volume published by the Camden Society within the first year of its existence and subscription, is a singular contrast to its graver and historical productions. Instead of digging into the mines of hoar Antiquity for great events, disputed facts, questionable dates, or clashing testimonies, Mr. Thoms has made a dash into her sparkling warehouse for a sample of her dusty jokes and quaint humours. He has ransacked the Harleian MS. No. 6395, for the best of the "Merry Passages and Jest" compiled by Sir Nicholas Lestrange;—the Lansdowne MS. No. 231, for Old Aubrey's queerest lucubrations;—and No. 3890 of the Additional MSS. for John Collet's prettiest anecdotes and stories.

To these selections he has appended fitting notes and biographical notices; and he has offered, in some sort, an apology for introducing this interlude of facetiæ among the publications of so worshipful an Association. This we think unnecessary. If our grandfathers loved a laugh, why should not we? and why should not we know what they used to laugh at? If we have not beards to wag, we have favoris, whiskers, and occasional moustaches. But what signifies the hair on men's faces, seeing that their minds and hearts are pretty much the same in all ages; and that drollery was from the beginning, and will be to the end of time, a source of pleasantry and genuine enjoyment?

Without further preface, therefore, we proceed to make a quarter-cento from Mr. Thoms's lightsome tome; and have only to point the attention of readers to the pun and fun exhibited in his own titles to the extracts. The first series is from the Harleian:—

"*A Mathematician Defined.*—Edm. Gurney used to say, that a mathematician is like one that goes to market to buy an axe to break an egg.—*L'Estrange*, No. 30. *Ed. Gurney.*"

"*Bowling Improved.*—My Lord Brookes us'd to be much resorted to by those of the preciser sort, who had got a powerful hand over him; yet they would allow him Christian libertie for his recreations; but being at bowles one day, in much company, and following his cast with much eagerness, he cried, 'Rubbe, rubbe, rubbe, rubbe, rubbe.' His chaplaine (a very strict mann) runs presently to him; and in the hearing of diverse, 'O good my lord, leave that to God—you must leave that to God!' says he.—*L'Estrange*, No. 164. *Mr. Russell.*"

"*Much Justice and little Law.*—There was a business that could not be acted by a single justice, yet Sir Edward Peyton, as a pre-

gative asse, would needs convent the parties before him; one, being a shrewd understanding plaine fellow, told him he thought his worshippe was mistaken, for one justice was not sufficientes for the business: 'Why, sirra,' says he, 'am not I a justice of the peace?' 'Yes, an't please your worshippe.' 'And am not I a justice of the quorum?' 'Yes, sir.' 'Why then, sirra,' says he, 'there's two justices for you,'—and so he entered like a foole into the cause.—*L'Estrange*, No. 329. *Sir Giles Allington.*"

"*Drinking Deep.*—One ask't Sir John Millesent how he did so conforme himselfe to the grave justices his brothers, when they mett. 'Why, in faith,' says he, 'I have no way but to drinke myselfe downe to the capacite of the bench.'—*L'Estrange*, No. 337. *My Cous. Pament.*"

"*Elizabethan Freemasonry.*—Charles Chester, a court foole in Queen Elizabeth's time, us'd to be girding very often at my Lord Knolls and Sir Walter Raleigh. Says Sir Walter Raleigh, 'My lord, gett but this foole to dinner one day, and you shall see what a trickes wee'll serve him.' So he did; and when his paunch was well filled (for he was a notable trencher-man), and he went out of the chamber, Sir Walter Raleigh followed him. 'Come, sirra,' says he, 'now wee'll be revenged on you for all your rogerie;' and having some servants by, tyed him hand and foote, sett him right up in a corner, called a mason or two, built him up presently to the chinne, and so close as he could not move, and thret'n'd to cover him in, but that he begg'd hard and swore he would abuse them no more, so they lett him stand till night.—*L'Estrange*, No. 412. *Phil. Callh.*"

Upon this the editor observes:—

"We have here a name which has hitherto, we believe, remained unrecorded, added to those of Pace, Clod, and the other jesters who flourished in the time, and at the court, of Elizabeth; for though it will be seen from the following extract from 'Aubrey's Lives,' ii. p. 514, where Chester appears likewise as the subject of a practical joke on the part of Sir Walter Raleigh (who is no doubt Aubrey's 'Sir W. R.'), that he was the original of Ben Jonson's 'Carlow Buffone,' he has never been known as a court-jester. 'In his (Jonson's) youthful time was one Charles Chester, that after kept company with his acquaintance; he was a bold impertinent fellowe, and they could never be at quiet for him; a perpetual talker, and made a noyse like a drum in a roome: so one time at a tavern, Sir W. R. beates him and seales up his mouth, i. e. his upper and nether beard, with hard wax. From him Ben Jonson takes his 'Carlo Buffone,' in 'Every Man out of his Humour.' A tolerably complete list of these motley retainers of the English court might be compiled; for the succession was scarcely interrupted from the time of Berdic, Joculator Regis, who is mentioned in 'Domesday,' down to that of Tom Kille-grew, who Peyps tells us, on the 13th February, 1667-8, 'hath a fee out of the wardrobe for cap and bells, under the title of 'king's fool or jester;' and may revile or jeer any body, the greatest person, without offence, by the privilege of his place.' In the lately published and highly interesting volume of M. Rigollet, entitled, 'Monnais des Fous,' &c. Paris, 1837, we are furnished with another curious fact on this subject, entirely unknown, we believe, to English antiquaries; we mean, the existence at the court of John of a jester, named Will Picol, or Piculfus,

exercising his functions, not *virtute officii*, but 'à titre feodal,' holding his good lands by the tenure of saying good things; the said good lands passing to his heirs, on the payment annually of a pair of golden spurs. The following is a copy of the grant which M. Rigollet has printed, by way of satisfying the doubts of the sceptical:—'Joannes . . . D. G. &c. Sciatis nos dedisse et presenti charta confirmasse Will. Picol, Follo nostro Fontem Ossane (perhaps Menil-Ozenne, pays de Mortain) cum omnibus pertinenciis suis, habend. et tenend. sibi et heredibus suis, faciendo inde nobis annuatim servicium unius Folli quoad vixerit: et post ejus decessum heredes sui eam de nobis tenebunt, et per servicium unius paris calcarium deauratorum nobis annuatim reddendo. Quare volumus et firmiter precipimus quod predict. Piculfus et heredes sui habeant et teneant in perpetuum, bene et in pace, libere et quiete, predictam terram,' &c. [Char. circa 1200, Bibl. Reg.]"

"*A great Difference.*—In Lynne their maior is allwayes chosen out of the twelve aldermen, and they out of eighteen others. One of the eighteen being at Rising (an ancient but decayed burrow-towne), and the then maior a mechanick man, a butcher or the like, says he: 'Mr. Maior, I heare you have a very odd forme and manner of election here of your maior.' 'Why, how is that?' says the maior. 'Why, they say for certaine that you and all your brethren goe into a barne, where every man hath his bottle of hey layde him for a cushion: then ther's a calf turn'd in at the barne dore, and looke to what bottle the calfe goe first, hee's the man.' 'Why then,' says he, 'I see the difference betwixt us and our brethren at Lynne; wee choose with one calfe, and you with eghteen.'—*L'Estrange*, No. 423. *Bro. Ham.*"

"*Rawleigh's Opinion of a Scotchman.*—Sir Walter Raleigh being at tables with a Scotchman, and having bound him up so as he had but one throw to get out, the Scott threw it, and for joy fell a friking and scratching, and *clawing his fingers.* At whose fortunate cast and jollity Raleigh was as much moved with indignation, and swore that now he saw it was impossible to bind a Scotchman up so fast but that he would *break* out in one place or other.—*L'Estrange. Sir Fr. Needham.*"

"*An apt Definition.*—Thomas Linacre, our English grammarian, being ask't his opinion of Baronius and Bellarmine, though a favorer of their religion in many things, answer'd, that the first syllable of each of their names (BA and BEL) in conjunction, gave the lively character of their persons; men whose scripture and doctrine sounded nothing but confusion.—*L'Estrange*, No. 519. *Sir J. Pooley.*"

"This," says Mr. Thoms, "is an excellent story; but is clearly improperly fathered upon Linacre, who died in 1524, whilst Baronius was not born until 1538, and Bellarmine not until 1542."

"*Music without Words.*—One Mr. Saunders, who loved music so well as he could not endure to have it interrupted with the least unseasonable noise, being at a meeting of fancy music, only for the violes and organ, where many ladies and gentlewomen resorted, some wanton tongues could not refrain their chaff, and lowd whispers sometime above the instruments. He, impatient of such harsh discords as they often interposed, the lesson being ended, riseth with his viole from his seate, and soberly addressing himselfe towards them, 'Ladies,' says he, 'this musicke is not vocall, for on my knowledge—these things were never made for

words: And after that they had not one word to say.—*L'Estrange, No. 536. Mr. Jenkins.*"

Mr. Thoms further illustrates this anecdote; and it is curious that one of the hits in *Lover's* farce is made at the propensity the English fashionables, however mum before, have to begin to talk and chatter whenever music is performed:—

"'Concerts of violas,' says Hawkins, iv. 339, 'were the usual musical entertainments after the practice of singing madrigals grew into disuse.'"

"*A Draught Horse.*—A scholler riding his horse hott into the water to drinke, scarce up to the fetlock, one wisht him to goe in deeper (least he foundered his horse); 'Hang him, jade,' sayes he, 'let him drinke up this first.'—*L'Estrange, No. 546. Mon Père.*"

"This anecdote," says the editor, "might well pass for one of the facetias of Hierocles; but does not, we believe, figure in that celebrated 'Collection of Jest,' which may, perhaps, be termed the *Gresian Joe Miller.*"

"*A Glass too Little.*—Capt. Robert Bacon, revelling at Sir W. Paston's, had his sack served him in a curious Venice glasse, but very much under the size that he us'd to trade in. And after a long contemplation of his measure, 'Sir William,' sayes he, 'if you value this glasse (as I beleve you doe) tye a good long string to it, to draw him up againe, for, before —, I shall swallow him down at one time or other.'—*L'Estrange, No. 547. Mr. Nose.*"

"*A Profitable Experiment.*—A sturdie vagrant on the high way, begged good-sawcily on Sir Drue Drurie. 'Ay, sirra,' sayes he, 'such as you make all your kinne fare the worse; for this is your fashion, deny ye but once (though happily not in earnest), a man's back is no booner turn'd but ye curse him to the pitt of hell.' 'Ah, sir,' sayes he, 'your worshipp is mistaken in me, I am none of these.' 'Faith,' sayes Sir Drue, 'I'll trye thee for this once,' and away he rides.—*L'Estrange, No. 548. Capt. Clinck.*"

"*Tom Brewer's Nose.*—Thom: Brewer, my Mus: Servant, through his proneness to good-fellowship having attained to a very rich and rabaund nose; being reprov'd by a friend for his too frequent use of strong drinckes and sacke, as very pernicious to that distemper and inflammation in his nose, 'Nay, faith,' sayes he, 'if it will not endure sack, it is no nose for me.'—*L'Estrange, No. 578. Mr. Jenkins.*"

"Whether the subject of the present anecdote is to be identified with the author of 'The Weeping Lady; or London like Ninivie in Sack-cloth,' 4to. London, 1696; and, 'A Knot of Pools,' London, 4to. 1688; or was merely his contemporary and namesake does not appear. Be this facetious asserter of the qualities indispensable to the most important feature of his face who he may, he was doubtless 'stuck to his nose,' somewhat like the subject of Quevedo's celebrated sonnet, beginning,

'Erase un hombre a una nariz pegado'

an idea which has been very felicitously rendered into English in the following lines:

'Ned is so short, his nose so long,
To say 'the nose of Ned' is wrong;
That each may rank in due degree,
'Ned of the Nose,' the phrase should be.
Poor Ned belongs to it, instead
Of it belonging to Poor Ned.'

"*A good Sermon bad in its Effects.*—A minister, having preached a very long sermon, as his custom was, some hours after ask't a gentleman his approbation of it; he replied that, 'Twas very good, but that it had spoyled a goose worth two of it.'—*L'Estrange.*"

To these Harleian Miscellanies we have now

to subjoin two bits from each of the other sources. The first two are from the *Lansdowne*—not the present marquee.

"*Clubs.*—In my father's time they had a clubbe (*fustis*) at the schoole-doore; and when they desired leave *æseundi foras* (two went together still) they carried the clubbe. I have heard that this was used in my time in country schooles before the warres. When monkes or fryars goe out of their convent they always are licensed by couples to be witnesses of one another's actions or behaviour. We use now the word clubbe for a sodality at a taverne or drinking house.—*Aubrey, 123 r.*"

"*Vowing of Children.*—Mr. George Dickson, now rector of Brampton, near Northampton, was by his breeding mother devoted to the office of the ministry; to which he was bred and ordained, though heir to a plentiful estate. In the Temple Church at London is a chapel, on the south of the roundabout walles, where in now the fines are conserved, but it was the chapel dedicated to St. Anne, which was resorted to by barren women; and was of great repute for making them 'joyful mothers of children.'—*Aubrey, 162 r.*"

"*A Presentment.*—In Henry the Fifth's time the clergy, in their convocation, ordered that three in every parish should make presentment upon oath of such persons as are defamed for hereticks, in obedience whereunto there was a presentment made by some of the parish of St. Mary Overies, in these word, viz. 'Item. wee saine that John Stevens is a man wee cannot tell what to make of him, and that he hath books wee know not what they are.'—*Collet, p. 21.*"

"*The Spread Eagle.*—The eagle with two necks in the imperial arms, and in the arms of the King of Spain, signifies the East and West Empire, and the extension of their power from the east to the west.—*Collet, p. 58.*"

We trust that all our readers, who do not hate merriment, will thank Mr. Thoms for this agreeable diversion from serious themes, and us for our skilful mingling of the entertaining variety with the drudgery of business, and the gravities of literature and science.

The Steam-Engine; its Invention and Progressive Improvement: an Investigation of its Principles, and its Application to Navigation, Manufactures, and Railroads. By Thomas Tredgold, Civil Engineer. A New Edition, enlarged by the Contribution of eminent Scientific Men, and extended to the Science of Steam Naval Architecture. Revised and Edited by W. S. B. Woolhouse, F.R.A.S. 2 vols. 4to. London, 1839. Weale.

THE first publication of Mr. Tredgold's work, on one of the most important mechanical and scientific subjects of our age, was so highly successful, that, besides being translated into the French, and, we believe, other languages, a new edition was imperatively called for. That call has been answered by the present enlarged work, in which has been embodied the progress and improved application of that mighty agent Steam, an investigation of its principles, and a practical view of its uses and effects in steam-vessels, steam-carriages, and railroads. When we look around us and see the face of the country changed and changing; the expedition of a week compressed into a single day; the limits of pleasure and of business widely extended among all classes of society; new wants created, and new wishes gratified; sedentary easily and readily converted into ambulatory life; the sphere of city

homes, as it were, enlarged by a circle of rural miles;—when, in fact, we see the prodigious alteration made in our social, statistical, economical, political, national, and international system, by the growing powers of this vast engine, we cannot but consider the effort to offer us a just and comprehensive account of it, to be one of the most meritorious within the scope of individual industry, skill, and labour. We, therefore, think the public deeply obliged to Mr. Tredgold, Mr. Woolhouse, and Mr. Weale, the enterprising publisher, who must have expended a very large sum on the risk, for the very important volumes now before us.

We are not unaware of the circumstance, that, on so tempting a field, where so many conflicting interests are contending for priority and profit, and so many speculative opinions are entertained in regard to every point that enters into the composition of these expensive pieces of machinery, and the yet more expensive undertakings to be sustained by their means, it is impossible to set forth any work like this, without being exposed to run the gauntlet of rival notions and competing claims. One man will prefer high, and another low pressure; one this sort of paddle-wheel, and another that; one such a boiler, and another a different; one a flue, another a chimney; one a bolt, another a screw; one propulsion from the sides, another from the centre, and a third from the stern; one coke, another coal, and a third prepared peat; that one will hold so many pounds weight on a certain surface to be too much and dangerous, and another not half so much as it can safely bear; one that a motion of a hundred miles an hour may be produced by an invention of his own, or of his adoption, whilst another laughs the project to scorn, and scouts the theory as a visionary dream;—in short, that there is no part, particle, or principle, connected with the subject, that is not liable to objection and censure. The evidence of the foremost engineers, on all questions relating to steam and rail-roads which have come under general discussion, has proved, if it proved nothing else, that it was hardly possible to get any two of them to agree on any one proposition.

We make these remarks in order to excuse ourselves from the hopeless task of endeavouring to reconcile all judgments to the dicta of Mr. Woolhouse, and of the scientific persons he has united with himself in executing this valuable work. To us it seems to be a publication of great magnitude and great worth. Above a hundred plates of steam-engines, &c. &c., illustrate its descriptions; and many woodcuts serve further to render the contents plain and intelligible to every capacity. Thus the actual operations of such men as Boulton and Watt, Maudslay and Field, Seawards, Napier of Glasgow, and other eminent mechanicians, and, we may add, enlightened philosophers as well as experienced artisans, are explained to us, and set before our eyes so as to be palpable to the understanding. In the same way the locomotives of the Messrs. Stephenson, of Newcastle, the construction of the elegant government steamboats of Mr. Laing, of Woolwich, and Mr. Fincham, of Sheerness (vessels it is a delight to notice as we pass up or down the river), are rendered familiar to us; and we care little to vex ourselves about hypothetical improvements and untried experiments. We have witnessed so many pseudo certain and undeniable inventions fail, that we have become rather sceptical when we hear of patents that are to supersede all that has been done before, or listen to the dictatorial laws of people

whom we have known to be more frequently wrong than right. We are glad to observe, however, that in this new edition, most of the errors of the former have been corrected; and what questionable statements or mistakes may remain, are not such as to impeach the vast utility of the publication.

The appendix, indeed, is deserving of much praise. The rules of practice are well expounded, and the mathematical calculations re-modified into simple arithmetic, are excellent for the purpose of enabling the working man ("operative" is the fashionable phrase) to perform his duty.

Upon the whole, not to dwell upon either real or supposed imperfections, inseparable from a production embracing so vast a number of complicated matters—a production treating of things in an almost daily state of partial transition—we feel bound to pronounce this treatise to be a very able and satisfactory exposition of the state of steam navigation and railroad travelling to the present time; and as such we heartily recommend it to the public at large, both at home and on the continent, where its predecessor has hitherto been esteemed a standard work.

Debates of the House of Commons in the Year 1774, on the Bill for making more effectual Provision for the Government of the Province of Quebec. Drawn up from the Notes of the Right Hon. Sir Henry Cavendish, Bart. Now first published by J. Wright, Editor of the "Parliamentary History," &c. 8vo. pp. 303. London, 1839. Ridgway.

AT a period when the importance of the two Canadas, the difference of opinion concerning them, their past history, their present condition, and their future prospects, occupy so large a share of public attention, nothing could be more appropriate or better timed than the appearance of this volume. It throws great light upon most of the points implicated in the discussions now going on; and in the result of which the fate of these provinces and their connexion with the British Empire are bound up. A valuable map adds greatly to the usefulness of these illustrations of the question. As it is not within our province to analyse a work of this sort, and as it must be studied by every one who takes an interest in Canadian affairs—including the affairs of Great Britain and the United States—we shall merely state that Lord North, Fox, Barré, T. Townshend, Sawbridge, Burke, Mansfield, Dunning, and other distinguished men, take an ample share in these debates; and that the following announcement of Mr. Wright not only explains the source whence this parliamentary record has been derived, but a further treasure of the most interesting character, which he promises to the world. We know not when we have seen an announcement of more national interest:—

"It has (Mr. W. tells us) long been a subject of regret, that the proceedings in the House of Commons, during the thirteenth parliament of Great Britain, commencing in May 1768, and ending in June 1774, should, in consequence of the strict enforcement of the standing order for the exclusion of strangers, have remained nearly a blank in the history of this country. With respect to the debates of that period, the following curious passage may be found in a work entitled 'Almon's Biographical Anecdotes,' first published in the year 1797:—'If ever Sir Henry Cavendish should publish his account of the debates in the British House of Commons, which he took in short-hand during the time he sat in it, which was from 1768 to 1774, Mr. Burke's speeches, in that important period, will appear with undoubted accuracy, and will give a more interesting picture of those times, than any which has hitherto been published.' I met with this passage about fifteen years ago, and have ever since been endeavouring to discover in whose hands this valuable

collection of debates was deposited; but it was not till the beginning of the present year, that I succeeded in finding it among the Egerton Manuscripts. It consists of forty-eight volumes quarto, and contains reports of all the important debates which took place, during the six sessions of the above-mentioned parliament. I have been able to verify it as the undoubted production of Mr. Henry Cavendish, at that time the member for Lostwithiel, who became, on the death of his father, in 1776, Sir Henry Cavendish, and in 1779, was made receiver-general of Ireland, and a member of the privy council. Shortly after this discovery, I was more fully impressed with the value of it, by perceiving, in the course of the recent debate on Lord Mahon's motion relative to Election Committees, that an authentic report of Mr. George Grenville's speech in 1770, on bringing in his bill for regulating the Trials of Convocted Elections, was much wished for; and that great and general regret was expressed, that no sufficient report of it had been preserved. I was led by this to examine the above collection; in which I had the satisfaction of finding, not only an extended report of Mr. Grenville's speech, but a full account of the several debates which took place during the progress of that bill. Having mentioned this discovery to Lord Brougham, and having shewn him a list of the numerous important debates which were contained in the collection, I was encouraged by his lordship to proceed in my design of editing and publishing the work. He not only wrote to several persons of distinction, warmly recommending it to their patronage, but, in his place in Parliament, called the attention of the House of Lords and of her majesty's ministers, to the public utility of the undertaking, and urged the propriety of affording me encouragement to carry it into effect. On my applying to the Trustees of the British Museum for permission to copy the MSS., I was very kindly informed that they cheerfully acceded to my request. The public will be gratified to learn that these Debates contain upwards of one hundred speeches of Mr. Burke, which have never seen the light, and a vast number of the most valuable speeches of George Grenville, Fox, Dunning, Lord North, Thurlow, Wedderburne, Barré, Blackstone, Beckford, Glym, Burgoyne, Dowdeswell, Lord John Cavendish, Sir George Savile, &c. &c. The Collection embraces the whole of the stirring period of the publication of the 'Letters of Junius,' and exhibits the feeling which prevailed in the House and the country, previous to the unhappy contest which took place between Great Britain and her American colonies.

It is of this period that Gibbon speaks, in the following passage of his 'Memoirs':—'The cause of Government was ably vindicated by Lord North, a consummate master of debate, who could wield, with equal dexterity, the arms of reason and ridicule. He was seated on the treasury-bench, between his attorney and solicitor-general, the two pillars of the law and state, *magis paros quam stulces*; and the minister might indulge in a short slumber, whilst he was upheld on either hand by the majestic sense of Thurlow, and the skilful eloquence of Wedderburne. From the adverse side of the house, an ardent and powerful opposition was supported by the lively declaration of Barré, the legal acumen of Dunning, the profuse and philosophic fancy of Burke, and the argumentative vehemence of Fox. By such men, every operation of peace and war, every principle of justice or policy, every question of authority and freedom, was attacked and defended; and the subject of the momentous contest was the union or separation of Great Britain and America.' The early portion of the collection has evidently been written out, under the inspection, or from the dictation, of the right honourable reporter himself, and apparently with a view to publication: another portion is written out from the short-hand notes, but the outline is not filled up: a third portion remains still in short-hand, which is perfectly intelligible to me. The system made use of is that made public in 1751, by Mr. Joseph Gurney, grandfather of the present short-hand writer to both houses of parliament; of whom it is highly probable, that Mr. Cavendish took lessons: he certainly wrote it with uncommon facility. The speeches are more minutely detailed than is usual, or even necessary, in parliamentary reporting; but, from this exactness, the fullest and greatest advantage is derived, that every speech contains the actual words made use of, taken down without the least attempt at embellishment, and with such evident marks of the peculiar mind of the speaker, that we seem to have before us the very man himself. It is another source of advantage to these debates, that they were all reported by one person, sitting in the house, not liable to be confused by interruptions, not liable to be turned out in the middle of a speech, and having no motive for the immense labour which he underwent, but the desire of possessing himself of a record of the proceedings of the time, taken with the utmost accuracy. From these reports, Mr. George Grenville was supplied by Mr. Cavendish, in 1769, with a copy of the only speech he ever published—that against the motion for expelling Mr. Wilkes. Mr. Burke, also, received from the same quarter the report of his memorable speech on American taxation, in April 1774, which he afterwards gave to the world in a corrected form. By the publication of this collection, the proceedings of a parliament, which has hitherto been called 'The Unreported Parliament,' will, at the expense of fifty-five shillings, be not only fully recorded, by the talents and scrupulous care of one of its own members, than any part of the parliamentary history of this country, previously to the relaxation of the standing order of the House of Commons. The work will consist of four or five volumes, of the same size as those of the 'Parliamentary History,' to which it is intended

ed as a supplement; and it will be published in parts, four of which will make a volume."

Life of Margaret Beaufort, Countess of Richmond and Derby, Mother of King Henry VII. By Caroline A. Halsted. 8vo. Pp. 262. London, 1839. Smith, Elder, and Co.

IT may appear strange, and almost wicked to say so, but "the Lady Margaret" was too good a woman to be a very interesting one, and especially as the theme for biography. Like Meg of Wapping

"She married three husbands,
And buried them all;"

was the mother of a powerful king, whom she also buried; the grandmother of Henry VIII., whom she educated so virtuously that the latter part of his sinful life was a terrible counter-balance to the merits of his youth; and was, in short, by her position and near relationship to the royal strugglers of those days, a person in whom centered very important connexions with all the leading events which distracted England during the concluding half of the fifteenth century.

The work before us having gained the palm for the best memoir of the high lady in question, offered by the directors of the Gresham Commemoration, it may readily be imagined that it is of the panegyrical order, in so far as relates to its subject, and of the ornate, in so far as relates to its style. These are inevitable ingredients in all compositions of the kind; and it is but justice to the fair writer to say that, in other respects, she has executed her task most creditably, and done all that she could to make us love and admire, not only Margaret Beaufort, but her cold and selfish son, the seventh Henry. Of her we are told, when only *nine years old*, that "young as was the rich heiress of Somerset, she had nevertheless sufficient discernment to prefer enriching her noble kinsman ap Tudor, rather than to gratify the ambitious and overbearing minister [the Duke of Suffolk], who was already reaping so abundant a harvest from the wardship of her great possessions. The comparatively recent ennoblement of the De la Pole, and the fact of their enormous wealth having been derived from mercantile speculations, may, in the estimation of the great-granddaughter of the haughty John of Gannet, have depreciated any advantages which might accrue from an alliance with the family of her guardian, when placed in comparison with the maternal brother of the reigning monarch of England—the grandson of Charles the Sixth of France—the descendant of the holy and royal St. Louis—and the lineal representative of the native princes of Britain. These circumstances might have influenced one who had been reared with even less pride of birth than the Lady Margaret; but with her education, and at her romantic age, with the dread too of disappointment, through the possible intrigues of others, the image of the young Edmund Tudor, whether she were sleeping or awake, must have been sufficiently predominant to account for any dream, or with the superstitious feeling of the times, to induce the belief of an actual vision."

We hope that ladies so very young do not take to such dreaming nowadays; but we should mention what little Lady Margaret's dream was, and "the incident which led to so important a decision as regards her after years, so rife with momentous events for futurity, will be best narrated from her own account, communicated to her spiritual director. 'Being then not fully nine years old, and doubtful in her mind what she were best to do, she asked counsel of an old gentlewoman, whom

she much loved and trusted, which did advise her to commend herself to St. Nicholas, the patron and helper of all true maidens, and to beseech him to put in her mind what she were best to do. This counsel she followed, and made her prayer so full often, but specially that night when she should the morrow after make answer of her mind determinately. A marvellous thing! the same night, as I have heard her tell many a time, as she lay in prayer, calling upon St. Nicholas, whether sleeping or waking she could not assure, but about four of the clock in the morning, one appeared unto her arrayed like a bishop, and naming unto her, Edmund, bade take him unto her husband. This vision she related to her parents, — which warrants the inference that her mother was at this time united to Lord Welles: the supernatural direction was by them considered conclusive, and Margaret accordingly declared her preference for the king's brother, to whom she was forthwith solemnly betrothed, in accordance with the custom of that period."

As a historian, our fair author should have put a bit of a caveat against this priestly fable; but, on the contrary, she comments upon it thus:—

"The spirit of romance which tinctured the moral actions, no less than the ascetic bigotry which marked the spiritual views of that period, might have led her adviser, from a well-meaning zeal, to impose some deception upon the innocent and guileless creature, who, with her worldly inclinations still bent towards Edmund Tudor, was evidently desirous of leaving to heavenly direction the future path of her earthly career. That Margaret Beaufort believed she saw a vision, is beyond all doubt; but whether she was deceived into the belief by the agency of others, or whether her childish imagination dwelt on St. Nicholas in prayer, until his image, and the object of her wishes were associated in her dreams, cannot be decided; and would indeed be a most unimportant point, had not the circumstance led to a result, so fraught with momentous events, as the marriage to which it was the prelude. Some few years, however, elapsed before the union of this illustrious young couple; and as the interval contains no historical facts connected with the Lady Margaret, which demand particular attention, it affords a fitting opportunity to trace the parentage of her future husband. This is the more needed, as the royal lineage of Edmund Tudor increased the perils and vicissitudes to which her own noble descent exposed this distinguished scion of the Red Rose of Lancaster,—that ill-omened badge which seemed to encircle with thorns the footsteps of all who cherished the fatal flower,—the crimsoned leaves of which were reddened yet more deeply by the blood of friends and relatives,—whose root sprang from usurpation and regicide,—whose opening buds were germs of discord,—whose expanded blossoms were signals of destruction. It is with feelings of repose that the mind, passing from such harrowing scenes, rests on the gentle character whose descent entailed not upon her the destructive qualities of her race. No! she was the flower that was destined to survive the blight which eventually visited her family; and to perpetuate, by means of her good deeds, that line which valour, heroism, and undaunted courage, had raised indeed to the highest pinnacle of glory, but which that very success tended only the more speedily to annihilate."

This extract will serve to shew the flowery language so frequently employed in the Life;

as well as the reasoning applicable to a dreamer of nine years of age.

We will not imbrangle ourselves or our readers with Tudor or Plantagenet pedigrees; but offer another specimen of the eulogistic, in the description of Margaret when she lost her husband, No. I. :—

"He died on the 1st November, 1456, leaving the bereaved Margaret, herself only in her sixteenth year, with an infant son,* the inheritor of the earldom, which his father had not enjoyed above four years, and destined to become in right of his mother (though the knowledge thereof was hidden by the veil of futurity), the future monarch of England. His illustrious parent was buried in the church of the Grey Friars at Caermarthen, from whence his remains, upon the suppression of the abbey, were removed to the cathedral of St. David's.† In the centre of the choir, and beneath a monument directly before the steps of the high altar, they yet lie, with an inscription styling him 'Father and brother to kings.'‡ But the vigorous and well-disciplined mind of Margaret of Richmond was singularly calculated to endure the extremity of grief. Deeply imbued with religious zeal, her faith was too firmly rooted to be shaken by the blast of affliction. She could discern the chastening hand of the Almighty from the arm of the avenger; and though smitten to the heart's core, and that too in the very zenith of her joy, she could school her grief sufficiently to feel that she had duties to perform to the living, which were yet more binding, from being hallowed by her fond remembrance of the dead. On her infant and now orphan child, the offspring of short-lived but genuine attachment, the Lady Margaret henceforth bestowed as much of her devotion and affection, as she tremblingly thought could be spared from the service of her God. Her struggles indeed were great, but her fortitude never forsook her; and with a submissive spirit, that brought its own reward, the widowed countess tutored herself to feel, with true Christian piety, that while her infant son was spared she was not wholly bereft. How long that blessing might be hers, she feared to think—for his sickly constitution during infancy was a fresh source of affliction to his anxious mother; but Richmond's earliest biographer, Bernard Andreas, who was contemporary with him,—and from whose authority this fact is derived§—bears testimony also to the maternal solicitude of the Lady Margaret, who nursed and tended her puny offspring with a watchfulness and care, more in unison with her energetic character than her youthful age."

Her patronage of Caxton, the father of English typography, and of Wynken de Worde, is of more consequence than her needlework and ascetic devotion; and her foundation of chapels and colleges marks her as a woman of great

piety and enlightened views. But these matters are so generally known, that it would be impertinent again to set them forth in our notice, though imperative on the writer to do so. We shall, therefore, conclude with an extract relating to that martyr who taught his rudiments to her grandson, Henry VIII., and whom he afterwards sacrificed at the stake.

"The Lady Margaret, was now soon to be deprived of the solace of her esteemed confessor. Dr. Fisher was nominated to the see of Rochester by Henry the Seventh, an unsolicited and voluntary boon, though at the time attributed very naturally to the influence of the Countess of Richmond over her son. The letter from the king to his mother being extant is here introduced as an additional evidence of the strong attachment that existed between them, and also as exhibiting the delicacy that prompted him to ask his parent's acquiescence in a preferment that might have been made to appear as the simple reward of merit, instead of resulting, as the letter implies, from the additional claims which the singular virtue, holiness, and piety of the almoner and confessor of Margaret of Richmond, had upon his discerning and approving sovereign.

"Madam,—an [if] I thought I should not offend you, which I will never do wilfully, I am well minded to promote Master Fisher, your confessor, to a bishopric; and I assure you, madam, for none other cause, but for the great and singular virtue, that I know and see in him, as well in cunning and natural wisdom, and specially for his good and virtuous living and conversation. And by the promotion of such a man, I know well it should courage [encourage] many others to live virtuously and to take such wages as he doth, which should be a good example to many others hereafter. Howbeit without your pleasure known, I will not move him, nor tempt him therein. And therefore I beseech you, that I may know your mind and pleasure in that behalf, which shall be followed as much as God will give me grace. I have, in my days, promoted many a man unadvisedly, and I would now make some recompense to promote some good and virtuous man, which I doubt not, shall best please God, who ever preserve you in good health and long life.—King Henry, to my Lady Grace his mother."

The confession with which his majesty finishes his letter is extremely entertaining; and, to keep it in countenance, we end with an equally whimsical expression of the author.

"It has been already observed, that by his two marriages John of Gaunt had only one son."

One might fancy that his wives had half a son apiece! but that is not, we believe, the writer's meaning?

Hallam's Introduction to the Literature of Europe.

[Third notice.]

MR. HALLAM's third volume is devoted entirely to the first half of the seventeenth century, the age in which flourished among its scholars, Casaubon, Salmasius, Grotius, Vossius, Scaliger, and a host of others; among theologians, Jeremy Taylor; among philosophers, Bacon, Descartes, Hobbes; among poets, Shakspeare, Jonson, Milton. In a thick volume, upon a period of so much interest, it is difficult to select our extracts from the multitude of passages which offer themselves, and with the necessarily small space into which we must contract them. Much, however, of this volume, particularly the long and elaborate ex-

* "Dugdale's Baron. vol. ii. p. 239."

† "Sandford's General Hist. B. iv. ch. 9."

‡ "The Earl of Richmond was buried in the chancel of the church of St. David's, with this inscription upon his monument: 'Under this marble stone, here enclosed, rest the bones of that noble lord, Edmund, Earl of Richmond, father and brother to Kings; who departed out of this world in the year 1456; the first day of November. On whose soul Almighty Jesu have mercy.'—*Master's Memoirs of Thomas Baker*, p. 149."

§ "Bernard Andreas was a native of Toulouse, and an Augustine monk; he was poet-laureate to Henry VII. and his son Henry VIII., and was Prince Arthur's tutor in grammar. His unpublished life of Henry VII. is in the Cottonian MSS. (Dom. xviii.) and was written in 1508. He was made poet-laureate in the 11th Henry VII., 1496, with an annuity of 10 marks; and in the privy purse expenses of that monarch (*Excerpta Hist.* p. 115.), frequent mention is made of small sums given 'To the bynde poet in reward.'"

aminations of the different philosophical, political, and theological systems of the great writers whom we have mentioned above, can only be read advantageously as a whole, and will not bear cutting into shreds. We will continue to take our extracts indiscriminately, as they catch the eye in turning over the pages.

Our knowledge of the literary history of the Middle Ages has been hitherto so extremely imperfect, that we are apt to consider the long period from the fall of the Roman power to what is termed the revival of learning as a mere blank, except in works of heavy theology and scholastic philosophy; and we thus too often go no further in our searches after the origin of modern forms and systems than the brink of this apparently dark abyss of ignorance, not knowing that, like the fairy land of romance, the supposed abyss is a rich garden, though surrounded with obscure mists which have hitherto veiled its existence from mortal eyes, and that the adventurous knight who fearlessly breaks through the barrier, will there find the types of most of the well-known plants that grow in his own land. As a remarkable specimen of this, we may instance the supposed originality of the plan of the school-books of Comenius. Such works were common enough during the middle ages, and one or two of them are preserved in manuscripts of the thirteenth century, as the "Dictionarius" of Johannes de Garlandia, which has been recently printed by M. Géraud, in his work entitled "Paris sous Philippe le Bel." These older and shorter works probably continued in popular use up to the time of Comenius himself, and his books are but an extension of a system that had been long known. Mr. Hallam does not seem to have been aware of this. As all our readers, perhaps, are not acquainted with the works of Comenius, we shall give his account of him:—

"This author, a man of much industry, some ingenuity, and little judgment, made himself a colossal reputation by his 'Orbis Sensualium Pictus,' and still more by his 'Janua Linguarum Reserata,' the latter published in 1631. This contains, in 100 chapters, subdivided into 1000 paragraphs, more than 9300 Latin words, exclusive, of course, of such as recur. The originality of its method consists in weaving all useful words into a series of paragraphs, so that they may be learned in a short time, without the tediousness of a nomenclature. It was also intended to blend a knowledge of things with one of words. The 'Orbis Sensualium Pictus' has the same end. This is what has since been so continually attempted in books of education, that some may be surprised to hear of its originality. No one, however, before Comenius seems to have thought of this method. It must, unquestionably, have appeared to facilitate the early acquirement of knowledge in a very great degree; and, even with reference to language, if a compendious mode of getting at Latin words were the object, the works of Comenius would answer the purpose beyond those of any classical author. In a country where Latin was a living and spoken tongue, as was in some measure the case with Germany, no great strictness in excluding barbarous phrases is either practicable or expedient. But, according to the received principles of philological literature, they are such books as every teacher would keep out of the hands of his pupils. They were, nevertheless, reprinted and translated in many countries; and obtained a general reception, especially in the German empire, and similarly circumstanced kingdoms."

Our next extract relates to the declining

years of Papal influence, and exhibits a strong picture of the ruling passion exhibited to the last. The power which under Charles I. dreamed of the subjugation of England, soon afterwards crouched beneath the iron-bound sternness of Cromwell and his sectarian warriors.

"Notwithstanding the tone still held by the court of Rome and its numerous partisans, when provoked by any demonstrations of resistance, they generally avoided aggressive proceedings, and kept in reserve the tenets which could not be pleasing to any civil government. We should, doubtless, find many assertions of the temporal authority of the pope by searching into obscure theology during this period; but after Bellarmine and Perron were withdrawn from the stage, no prominent champions of that cause stood forth; and it was one of which great talents and high station alone could overcome the intrinsic unpopularity. Slowly and silently the power of Rome had much receded before the middle of the seventeenth century. Paul V. was the last of the imperious pontiffs who exacted obedience as sovereigns of Christendom. His successors have had recourse to gentler methods, to a paternal rather than regal authority; they have appealed to the moral sense, but have rarely or never alarmed the fears of their church. The long pontificate of Urban VIII. was a period of transition from strength to weakness. In his first years, this pope was not inactively occupied in the great cause of subduing the Protestant heresy. It has been lately brought to light, that soon after the accession of Charles I., he had formed a scheme, in conjunction with France and Spain, for conquering and partitioning the British islands: Ireland was to be annexed to the ecclesiastical state, and governed by a viceroy of the holy see.* But he afterwards gave up these visionary projects, and limited his ambition to more practicable views of aggrandisement in Italy. It is certain that the temporal principality of the popes has often been a useful diversion for the rest of Europe: the duchy of Urbino was less in our notions of importance than Germany or Britain; but it was quite as capable of engrossing the thoughts and passions of a pope."

We are sure that it is not generally known that Grotius, in his latter years, exhibited the inclination to go over to the church of Rome:

"But the epistles of Grotius afford such evidence of his secession from the Protestant side, as no reasonable understanding can reject. These are contained in a large folio volume, published in 1687, and amounting to 1766 of one series, and 744 of another. I have quoted the former, for distinction's sake, by the number, and the latter by the page. Few, we may presume, have taken the pains to go through them, in order to extract all the passages that bear upon this subject. It will be found that he began, as I have just said, by extolling the authority of the Catholic, or universal Church, and its exclusive right to establish creeds of faith. He some time afterwards ceased to frequent the Protestant worship, but long kept his middle path, and thought it enough to inveigh against the Jesuits and the exorbitancies of the see of Rome. But his reverence for the writers of the fourth and fifth centuries grew continually stronger; he learned to protest against the privilege claimed by the reformers, of interpreting Scripture otherwise than the

* "Ranke, ii. 518. It is not at all probable that France and Spain would have seriously coalesced for any object of this kind: the spoil could not have been safely divided. But the scheme serves to shew the ambition, at that time, of the Roman see."

consent of the ancients had warranted; visions, first of a union between the Lutheran and English churches, and then of one with Rome itself, floated before his eyes; he sought religious peace with the latter, as men seek it in opposition to civil government, by the redress of grievances and the subsequent restoration of obedience. But in proportion as he perceived how little of concession was to be obtained, he grew himself more ready to concede; and though at one time he seems to deny the infallibility of the church, and at another would not have been content with placing all things in the state they were before the Council of Trent, he came ultimately to think such a favourable sense might be put on all the Tridentine decrees, as to render them compatible with the confession of Augsburg. From the year 1640 his course seems to have been accelerated; he intimates no disapprobation of those who went over to Rome; he found, as he tells us, that whatever was generally received in the church of Rome, had the authority of those Greek and Latin fathers whose communion no one would have refused; and at length, in a remarkable letter to Wytenbogat, bearing date in 1644, he puts it as worthy to be considered, whether it would not be more reasonable for private men, who find the most essential doctrines in a church of a universal hierarchy and a legitimate succession, to waive their differences with it for the sake of peace, by putting the best interpretations they can, only keeping silence on their own opinions, than that the Catholic church should accommodate itself to the separate judgment of such men. Grotius had already ceased to speak of the Arminians as if he was one of themselves, though with much respect of some of their leaders. Upon a dispassionate examination of all these testimonies, we can hardly deem it an uncertain question whether Grotius, if his life had been prolonged, would have taken the easy leap that still remained; and there is some positive evidence of his design to do so. But, dying on a journey, and in a Protestant country, this avowed declaration was never made.

"It appears to me, nevertheless, that Grotius was very far from having truly subjected his understanding to the church of Rome. The whole bent of his mind was to effect an exterior union among Christians; and for this end he did not hesitate to recommend equivocal senses of words, convenient explanations, and respectful silence. Listening attentively, if I may be allowed such a metaphor, we hear the chant of the Æsculapian cock in all he has written for the Catholic church. He first took up his reverence for antiquity, because he found antiquity unfavourable to the doctrine of Calvin. His antipathy to this reformer and to his followers led him on to an admiration of the episcopal succession, the organised hierarchy, the ceremonial and liturgical institutions, the high notions of sacramental rights, which he found in the ancient church, and which Luther and Zuingli had cast away. He became imbued with the notion of unity as essential to the Catholic church; but he never seems to have gone the length of abandoning his own judgment, or of asserting any positive infallibility to the decrees of man. For it is manifest that, if the councils of Nice or of Trent were truly inspired, it would be our business to inquire what they meant themselves, not to put the most convenient interpretations, nor to search out for some author or another who may have strained their language to our own opinion. The precedent of Grotius, therefore, will not serve those who endeavour to bind

the reason of the enlightened part of mankind, which he respected like his own."

The following account of the style of preaching in the first half of the seventeenth century, cannot but be interesting to the general reader. We would, however, observe, that we think the accusation contained in the first sentences is a little too general, and also rather too strong:—

"The style of preaching before the Reformation had been often little else than buffoonery, and seldom respectable. The German sermons of Tauler, in the fourteenth century, are alone remembered. For the most part, indeed, the clergy wrote in Latin what they delivered to the multitude in the native tongue. A better tone began with Luther. His language was sometimes rude and low, but persuasive, artless, powerful. He gave many useful precepts, as well as examples, for pulpit eloquence. Melancthon, and several others, both in the sixteenth and seventeenth centuries, as well in the Lutheran as the reformed church, endeavoured by systematic treatises to guide the composition of sermons. The former could not, however, withstand the formal, tasteless, and polemical spirit that overspread their theology. In the latter a superior tone is perceived. Of these, according to the Eickhorn, the Swiss preachers were most simple and popular, the Dutch most learned and copious, the French had most taste and eloquence, the English most philosophy. It is more than probable that in these characteristics he has meant to comprise the whole of the seventeenth century. Few continental writers, as far as I know, that belong to this its first moiety, have earned any remarkable reputation in the province of theology. In England, several might be distinguished out of a large number. Sermons have been much more frequently printed here than in any other country; and, from the beginning of the seventeenth century, form a large proportion of our theological literature."

Passing over theology, philosophy, and morals, which form nearly two-thirds of the volume, we again find ourselves in the cheerful region of poetry. We can hardly venture upon Mr. Hallam's long-detailed, and, we think, remarkable criticisms on Milton, Shakespeare, and the other tragedians of this age. We are much pleased, too, with many of his remarks upon the lesser poets who were their contemporaries. We give his accounts of the "Polyolbion" of Drayton:—

"Next to Daniel in time, and much above him in reach of mind, we place Michael Drayton, whose 'Barons' Wars' have been mentioned under the preceding period, but whose more famous work was published partly in 1613, and partly in 1622. Drayton's 'Polyolbion' is a poem of about 30,000 lines in length, written in Alexandrine couplets; a measure, from its monotony, and perhaps from its frequency in doggerel ballads, not at all pleasing to the ear. It contains a topographical description of England, illustrated with a prodigality of historical and legendary erudition. Such a poem is essentially designed to instruct, and speaks to the understanding more than to the fancy. The powers displayed in it are, however, of a high cast. It has generally been a difficulty with poets to deal with a necessary enumeration of proper names. The catalogue of ships is not the most delightful part of the 'Iliad'; and Ariosto never encounters such a roll of persons or places without sinking into the tamest insipidity. Virgil is splendidly beautiful upon similar occasions; but his decorative elegance could not be pre-

served, nor would continue to please in a poem that kept up through a great length the effort to furnish instruction. The style of Drayton is sustained, with extraordinary ability, on an equable line, from which he seldom much deviates, neither brilliant nor prosaic; few or no passages could be marked as impressive, but few are languid or mean. The language is clear, strong, various, and sufficiently figurative; the stories and fictions interspersed, as well as the general spirit and liveliness, relieve the heaviness incident to topographical description. There is probably no poem of this kind in any other language, comparable together in extent and excellence to the 'Polyolbion'; nor can any one read a portion of it without admiration for its learned and highly gifted author. Yet perhaps no English poem, known as well by name, is so little known beyond its name; for while its immense length deters the common reader, it affords, as has just been hinted, no great harvest for selection, and would be judged very unfairly by partial extracts. It must be owned, also, that geography and antiquities may, in modern times, be taught better in prose than in verse; yet whoever consults the 'Polyolbion' for such objects, will probably be repaid by petty knowledge, which he may not have found any where else."

Although there is much in this third volume which we leave with regret, yet our space obliges us to pass it by. We will end for the present with a short specimen of the criticisms on the poetry of Milton; it relates to two of his shorter, but most beautiful productions, "Comus," and the "Ode on the Nativity":—

"'Comus' was sufficient to convince any one of taste and feeling, that a great poet had arisen in England, and one partly formed in a different school from his contemporaries. Many of them had produced highly beautiful and imaginative passages; but none had evinced so classical a judgment, none had aspired to so regular a perfection. Jonson had learnt much from the ancients; but there was a grace in their best models which he did not quite attain. Neither his 'Sad Shepherd,' nor the 'Faithful Shepherdess' of Fletcher, have the elegance or dignity of 'Comus.' A noble virgin and her young brothers, by whom this masque was originally represented, required an elevation, a purity, a sort of severity of sentiment, which no one in that age could have given but Milton. He avoided, and nothing loath, the more festive notes which dramatic poetry was wont to mingle with its serious strain. But for this he compensated by the brightest hues of fancy, and the sweetest melody of song. In 'Comus,' we find nothing prosaic or feeble, no false taste in the incidents, and not much in the language; nothing over which we should desire to pass on a second perusal. The want of what we may call personality, none of the characters having names, excepting Comus himself, who is a very indefinite being, and the absence of all positive attributes of time and place, enhance the ideality of the fictions by a certain indistinctness not displeasing to the imagination."

"The 'Ode on the Nativity,' far less popular than most of the poetry of Milton, is perhaps the finest in the English language. A grandeur, a simplicity, a breadth of manner, an imagination at once elevated and restrained by the subject, reign throughout it. If Pindar is a model of lyric poetry, it would be hard to name any other ode so truly Pindaric; but more has naturally been derived from the Scriptures. Of the other short poems, that on the death of

the Marchioness of Winchester deserves particular mention. It is a pity that the first lines are bad, and the last much worse; for rarely can we find more feeling or beauty than in some other passages."

MISCELLANEOUS.

British History, Chronologically Arranged; comprehending a Classified Analysis of the Occurrences in Church and State, and of the Constitutional, Political, Commercial, Intellectual, and Social Progress of the United Kingdom, from the first Invasion of the Romans to the Accession of Queen Victoria. By John Wade, author of the "History of the Middle and Working Classes," &c. &c. 8vo. pp. 1184, double columns. London, 1839. Wilson.

THE author tells that he has compiled this history something on the plan of a newspaper, with a leading article descriptive of the principal events of every reign, and then a chronological summary, with all the other needful accessories, as set down in the title-page. That page is so explanatory of the design, that our attention was only directed to its execution, and it affords us pleasure to say that the original chapters alluded to are moderate, fair, and impartial, without going deeply into philosophising; which, in our opinion, oftener mars than mends the truth and lessons of history. The other portions are diligently and faithfully put together; and the whole volume is decidedly one of the best that has ever appeared as a work for ready and useful reference to the annals of our country. As a family book, we know of none to compare with it for these great merits.

The East India Voyager; or Ten Minutes' Advice to the Outward Bound. By Emma Roberts, author of "Memoirs of the Rival Houses of York and Lancaster;" "Scenes and Characteristics of Hindostan," &c. &c. Pp. 263. London, 1839. Madden and Co. (late Parbury and Co.)

MISS ROBERTS'S excellent talents for observation have a wide and a useful field in this publication, for which every European destined for India owes her a deep debt of gratitude. There is hardly a possible circumstance of which it does not treat, in a manner likely to be most advantageous to those who consult it; and on many subjects of vital consequence to the individual, there is such sound and sage advice, that it must indeed be well for those who will take the trouble to think upon, and be guided by it. Every branch of the service is separately examined, and rules for conduct laid down. From the merest trifles necessary for comfort, to the gravest affairs which require judgment and decision—from the particulars of dress, and travelling, and eating, and sleeping, to the most important business of public life—there are suggestions which will be found serviceable in every way, and render a thousand things easy and agreeable which would otherwise be full of annoyance and trouble. Need we add, that it is a volume for all Indians to possess as a friend and counsel?

Life of Sir Walter Scott, Bart. Vols. IV. and V. Edinburgh, 1839. Cadell. London, Whittaker and Co.

THE whole-length of Scott after Raeburn, and the vignette, the house in Castle Street, in which he lived twenty-five years, are the graceful embellishments of the former of these volumes; as are Lady Scott, after Saxon, and Abbotsford in 1812, equally appropriate, though not so well executed, engravings of the latter.

The general interest of the text seems to lose nothing by repetition.

Egypt: Familiar Description of the Land, People, and Produce. With a Map, and Fifty-three Wood-Engravings. Pp. 331. (London, W. Smith.)—A neat popular account of a country which has recently risen to a degree of political importance likely to have very great influence on the destiny of nations. We recommend it strongly to young readers.

Cleanings from Many Fields. Pp. 163. (London, Harvey and Darton.)—A miscellany of various matters for children's reading. *The Infants' Catechism* (pp. 80) is another, and more useful, and executed with better judgment.

Military Law Authorities, &c., by Major W. Hough. Pp. 255. (Calcutta, Hacker and Co.; London, Allen and Co.)—Of this volume we need only say that it is an excellent manual, and ought to be in the hands of every man engaged in courts-martial.

ARTS AND SCIENCES. COMPRESSED PEAT.

It is a subject of congratulation to us, that among the numerous discoveries and improvements of the last twenty (in that respect, eventful) years, with which we have done our part in making the public acquainted, it has been our good fortune to bring under general notice the very important invention indicated by the title above. Having been privy to the early experiments, and witnessed the progress of the attempt, amid difficulties which were almost enough to discourage enterprise, we rejoice the more in having been the only channel to direct attention to the work, as we are now to hail its final and successful issue. Lord Willoughby de Eresby, high in rank and official station, and with many onerous duties attached to his social position, has done himself great honour in this pursuit. With the assiduity and perseverance of a tradesman, whose own peculiar emolument was the object in view, and not the accomplishment of a patriotic and national benefit, his lordship has year after year devoted his exertions to this task, and his mind to the devising of means by which the obstacles that presented themselves were to be overcome. And diligence and ingenuity have prevailed. A brief pamphlet, of a dozen pages, gives a description of the different machines which he has used for the compression of peat, till he has ultimately satisfied himself by bringing the last to working perfection.

Diagrams, which we cannot copy, fully illustrate all these particulars:—

"During a constant residence (his lordship says) in the mountainous districts of Scotland and Wales, where the inhabitants depend chiefly upon peat for their fuel, Lord Willoughby had given much attention to the manner of preparing it for use. From observing the impossibility of rendering it available in a wet season (together with its comparatively small value, even in the most favourable,) for domestic or manufacturing purposes, he was induced to enter upon a series of experiments for its compression by machinery. The first of these took place in the summer of 1834."

This machine was choked by the fibrous matter of the peat; and a second also suffered the material to escape with the expressed moisture. Lord Willoughby then adopted linen cloth wrappers to prevent this loss, and a third machine gave a considerable remedy for the evil. But still there was something wanting; and other machines were tried and tested, and other improvements were made, till the present specimen was completed and employed in the extensive and successful manufacturing of this species of fuel:—

"For the machine thus improved (we are informed) a patent has been obtained by Lord Willoughby, extending to England only; but he wishes it to be understood that any individual

is at liberty, upon a proper application, to avail himself of the invention gratuitously. It may be useful to add a few general remarks to the foregoing description. In the selection of peat for compression, care must be taken to obtain a black peat, free from fibre. Peat of the proper description has very much the appearance of blackened butter, and is the only sort which will repay the expense of preparation. The peat should be dug of the usual size, namely, eight inches by three, and three deep, and of a uniform shape, which is easily effected by a spade of a peculiar construction. All attempts which have been made to compress peat in large masses of various dimensions have invariably failed. In every instance the water has been retained in the centre of the mass, and expelled only from its surfaces. Even had the result of these trials been different, the peat so prepared would be useless for general purposes until cut into small pieces. Before compression, the peats must be placed to dry for five or six days under sheds, in the same manner as bricks and tiles, and after compression must remain under cover until perfectly free from moisture, when they will be fit for use. At the recommendation of several friends, Lord Willoughby has attempted to dry them in various ways by artificial heat, but without any satisfactory result. The peat, when properly compressed, is reduced about one-third in size, hard and compact, and nearly black in colour; it varies slightly in density, sometimes floating, at others sinking in water. As to its uses, it will be found an excellent substitute for coal. It may be used in grates for domestic purposes, and has been tried successfully in calcining lime. In an experiment with the steam-engine at St. John's foundry, Perth, where one of the machines already described was made, the peat was found to outlast an equal weight of coal, in the proportion of sixteen per cent, the engine being worked at its ordinary rate. There is every reason to believe that it might be employed in the manufacture of gas, which it gives off in abundance, burning with a clear white light. It may also be prepared by charring, in the same manner as ordinary charcoal, by which its size is reduced about one-half. When charred in this way, the slowness and difficulty with which it burns renders it an extremely valuable fuel in many processes of the arts: this value is increased by its freedom from sulphur, and the comparatively small quantity of ashes which it leaves after burning. For the working of steel in particular, its freedom from sulphur makes it greatly superior to charcoal. It has been applied to this purpose by Messrs. Philp and Whicker (late Savigny and Co.), St. James's Street, who have used it with remarkable success in forging razors and surgical instruments. The articles bear the stamp 'forged with peat,' as well as the names of these gentlemen by whom they are highly recommended. The charred peat has also been employed in the working of other metals, particularly in the soldering of thin brass, with a most encouraging result. In conclusion, it may be mentioned, that it is as serviceable in the kitchen as common charcoal, and occasions no unpleasant taste or smell."

"The quantity of peats which may be thus compressed in one day, may be estimated at 27,000, or 45 per minute, under a pressure of 400 pounds on the square inch, with a high pressure steam-engine of six-horse power."

To this we have little to add. In former papers we pointed out the extraordinary value of the invention as regarded Scotland and Ireland, and parts of England where peat pre-

valled and coal was distant; we shewed that the bog and the desert might by its use be readily converted into the productive factory and busy population; we expressed our conviction that it was alone sufficient to create a revolution on the face of the country, spreading comfort and plenty where distress and penury grieved the heart of the philanthropist and legislator. We are now more than ever convinced that it will do all these things; and we only pray for its speedy and general application, to see our own hopes and Lord Willoughby's liberal objects happily realised.

BRITISH ASSOCIATION.

THERE are, we understand, some doubts whether the British Association will meet this year or not. It depends upon the situation of Birmingham, the mayor of which town has applied, we are informed, to Lord John Russell on the subject. It will, of course, be for the Home Secretary to consider whether it will be safe or otherwise to allow causes of excitement, and the congregation of crowds, by night as well as by day, to be introduced into a place where the populace are in so inflammable and dangerous a state. Should any unfortunate circumstances result, he would be greatly blamed; and it might perhaps be more discreet to create no opportunities for collision and mischief. The authorities of Birmingham and its vicinity cannot but be anxious on the matter; for, after all the preparations made, it would be a sore disappointment to be obliged to *un-invite* their promised guests. But still the public peace and tranquillity are objects of far greater consequence; and if these cannot be preserved from risk without the adoption of extraordinary and incongenial means, we are sure it would be better to postpone this meeting. Science and Chartism, fêtes and riots, philosophy and bloodshed, would not comport well together. At all events, the prospect is neither certain nor comfortable.

LITERARY AND LEARNED.

To the Editor of the *Literary Gazette*.

SIR,—A few days ago I transmitted to you copies of original letters from Johnson and Addison, the letters themselves having been hooked up in the New River by a fisherboy; and at the same time gave you to understand others were in my possession, derived from the same simple and genuine authority. I now send you a copy of a letter

From Queen Anne to the Duke of Marlborough, after the Victory of Oudenarde.

"Sir,—I want words to express the joy I have that you are well after your glorious success, for which, next to God Almighty, my thanks are due to you: for, indeed, I can never say enough for all the great and faithful services you [have?] ever done me. But be so just as to believe I am as truly sensible of them as a grateful heart can be, and shall be ready to shew it upon all occasions. I hope you cannot doubt of my esteem and friendship for you, nor think, because I differ from you in some things, it is for want of either. No. I do assure you if you were here, I am sure you would not think me so much in the wrong in some things as you do now. I am afraid my letter should come too late to London, and therefore dare say no more, but that I pray God Almighty to continue his protection over you, and send you safe home again: and be assured I shall ever be, sincerely yours, ANNE R."

To this letter there is neither date nor

address, which shews that Anne was not a man of business.

Yours faithfully,
18 Devereux Court, Temple,
26th July, 1839.

J. M. F. W.

ROYAL SOCIETY OF LITERATURE.

Anglo-Saxon Literature.

IN pursuing his interesting inquiries and elucidation of the attainments and habits of our Saxon ancestors, Mr. Wright proceeds to exhibit their acquaintance with *Geography*; and he remarks—

"We find the Anglo-Saxons at an early period distinguished by the same spirit of adventure, which has been so active and fruitful among their descendants. They were anxious to explore the distant countries, whose existence had been made known to them by the books which the missionaries imported. Even so early as the seventh century they were in the habit of going to Rome by sea, a voyage in which the pilgrims necessarily incurred many perils. At the end of this century, a Frankish bishop named Arculf, who was returning from the Holy Land, and had visited Constantinople, Damascus, and Alexandria in Egypt, as well as many of the islands of the Mediterranean, was thrown by bad weather on the western coasts of England, where he became acquainted with the Abbot Adamnan. The latter carefully stored up the information which the traveller communicated to him, and afterwards committed it to writing in a treatise which is still preserved. It is probable, indeed, from many circumstances, that the Anglo-Saxons themselves made frequent visits, not only to Italy, but also to the East.* King Alfred, who in this, as in other things, merited well the character given him by historians of being 'a diligent investigator of unknown things' (ignotum rerum investigatiori solerter se jungat), sent Sighelm, bishop of Sherburn, in 883, to India to visit the scene of the labours of St. Thomas and St. Bartholomew; and Sighelm not only reached in safety this distant land, but he brought back with him many of its productions, and particularly some gems and relics which were still preserved in his church in the time of William of Malmesbury. The present day cannot furnish a more intelligent account of a voyage of discovery, than that taken down by Alfred from the mouths of Othhere and Wulfstan, one of whom had sailed to the North Cape, and the other along the northern shores of the Baltic, and which that monarch has inserted in his own version of Orosius. The map of the tenth century, mentioned above, is far more correct than the generality of maps, which we find in old manuscripts at a later period; its chief inaccuracy lies in the distorted shape given to Africa, which is here a long narrow slip of land running out from east to west; but the coasts of India and Eastern Asia are not ill defined, there are few of the fabulous indications which appear afterwards in this part of the world, and Paradise does not occupy the place of the isles of Japan, as it did after the voyage of St. Brandan became popular in the twelfth century."

But, perhaps, none of the topics brought forward by Mr. Wright is more curious, or throws more light upon the domestic and peculiar manners of the Saxons in England, than the view of *Medicine*, as one of the *Natural Sciences*. Mr. W. says:—

"The systematical study of natural history, in any of its branches, has never been culti-

vated among a people who had not reached a high state of civilisation. Many of the operations of nature are indeed of that wonderful character, that they cannot fail to attract at all times the attention of the observer; and although these insulated observations were often the cause of the wildest errors among the philosophers of a comparatively barbarous age, yet they contained the germs of modern science. The marvellous transformations which accompanied the change of the creeping worm into the elegant butterfly, the singular habits of some animals, and the instincts of others, were the groundwork of many a superstitious fable. Even the fossil remains of a former world did not pass unnoticed; in old writers, such for example as William of Newbury in the twelfth century, we find many tales of animals imbedded in rocks, accidentally released from their imprisonment, which were undoubtedly founded upon discoveries of fossils; and these remains perhaps also gave rise to the legends of dragons which brooded in caves over hidden treasures, and of other animals no less extraordinary and fearful than the forms which are presented to us by the researches of modern geologists. The foreign books on natural history, which the Anglo-Saxons seem to have possessed, were by no means calculated to give them any very enlightened notions on the subject, for they consisted chiefly of fabulous narratives of the imaginary monsters which were supposed to live under the burning skies of India and Africa, or of those moralisations of the ordinary instincts of some animals which a little later became more universally popular under the title of 'Bestiaries.' The learning of the ancients was communicated to the people of the middle ages by two distinct roads. First, it was introduced along with the ancient literature, when those who received it, only just emerging from the depths of ignorance, were least capable of cultivating it with advantage, and when, from their preconceived ideas and various other causes, it was much disfigured, and very partially developed. Secondly, after having found a more favourable soil among the Arabians in the East, whose vast conquests and more enlarged field of scientific observation were naturally attended with a proportionate intellectual development, it became the groundwork of a school which, at a later period, was carried directly to the West, and gradually took the place of the barbarous, half-Romanised school, which had there existed—we can hardly say flourished—through several ages. This was more particularly the case with the medical and chemical sciences, which, less than any others, the Anglo-Saxons were capable of receiving from their instructors. Before the influence of the Arabian school was felt, even the elixir and the philosopher's stone were not thought of, and the medical knowledge of our early forefathers was confined within very narrow limits. In the last struggles of the Roman power, and during the inroads of the barbarous tribes before whom it fell, all the ancient practical knowledge of medicine and surgery must have disappeared. The books which remained were almost useless, not only from this want of practical skill, but also from the impossibility of procuring most of the articles which were enumerated in them, among people who had no certain commercial intercourse with distant parts of the world. This was felt strongly among the Anglo-Saxons; and one of Boniface's correspondents, while earnestly desiring to be remembered, in case that adventurous missionary should meet with any medical books

which were not known in England, complains at the same time of the difficulty of using them on account of the foreign ingredients which those works prescribed. The consequence of this was, that the Anglo-Saxons either returned to the old superstitious practices and receipts which had been used before their conversion to Christianity, or submitted to the authority of certain spurious books which were equally absurd and superstitious, and which appear to have been made with the object of remedying the difficulties above mentioned. The book which seems to have exerted the greatest influence on the science of medicine among the Anglo-Saxons, was a Latin herbal, published under the name of Apuleius, and containing, as it was pretended, the doctrines taught to Achilles by Chiron the Centaur. This spurious treatise, with a tract attributed to Antonius Musa on the virtues of the herb betony, and another bearing the title of 'Medicina Animalium,' and the name of Sextus Philosophus, formed, in an Anglo-Saxon translation, of which several copies are still extant, the popular text-book among the old physicians. We may cite, as a fair specimen of the character of this herbal, the account of the herb betony, which is almost a literal version from Antonius Musa. This plant, we are told, should be gathered in the month of August; no iron was to be used in digging it up; and, when duly prepared, it was not only a powerful antidote against many diseases, but also a sure and efficient defence against spectres, fearful sights, and dreams. In addition to this herbal, we find amongst Anglo-Saxon manuscripts several medical works and collections of receipts, which are interesting to us, not only for the light they throw upon the early history of medicine in our island, but also because they make us acquainted with the classes of diseases chiefly prevalent among the Anglo-Saxons, and thus illustrate collaterally the state of society in general. This class of works, indeed, forms rather an important part of the remains of the literature of these early ages, and deserves more attention than has been hitherto bestowed upon it. Among the manuscripts in the British Museum which are commonly quoted as the Royal Manuscripts, and which were formerly kept at St. James's Palace, we find a very curious book on medicine, splendidly written in the Anglo-Saxon language, apparently of the earlier part of the tenth century, and probably at that time the property of a physician of some eminence. This book is divided into two parts, the first relating chiefly to the treatment of external diseases, and the second to inward diseases, and those of a more complicated nature. A large proportion of the cases here provided against, are outward wounds, arising sometimes from accident, but more frequently from personal violence, the prevalence of which we may assume from the minutely detailed penalties imposed upon it by the Anglo-Saxon laws. The numerous receipts against the bites of adders and other venomous reptiles, shew that these latter were infinitely more numerous, and probably more various, than they are at present, and aid us in conceiving the picture which our island then presented to the eye, thinly inhabited, ill cultivated, and covered with marshes, woods, and wilds. We find, also, in the work above mentioned many receipts against the effects of poison; and (which appears singular enough) there are more provisions against diseases of the eye than against any other complaint. It is, perhaps, in some measure to the prevalence of this latter class of diseases in former times, that we owe the

* How curiously this conjecture confirms the opinion of Col. Tod.—See Review of his "Rajasthan."—Ed. L. G.

preservation of the numerous superstitions connected with springs of water; and the peasantry in many parts of our island still use them, not on account of the purity of the water, but with a belief in some peculiar attributes of the well itself. Although this treatise is not a herbal, still the ingredients mentioned are chiefly vegetables, though mixed up sometimes with other substances, such as ale and honey, of which latter commodity the consumption was very great among the Anglo-Saxons, and, less frequently, fat, oil, or wine. The powerful medicinal effects produced by vegetable mixtures, and the facility with which they were obtained, will easily explain the great reputation they enjoyed in an uncultivated age; but the real causes of diseases were little known, the connexion between the complaint and the remedy was seldom or very imperfectly understood, and the success of the latter must have been extremely problematical. The object generally aimed at seems to have been to produce a sudden and strong impression on the system, the effect of which must often have proved fatal. One of the receipts against the headache, given in this book, directs that a salve, composed of rue and mustard-seed, should be applied to the side of the head which was free from pain, evidently with the expectation of producing a sudden nervous re-action. So again for the cure of sore eyes, we are directed to make a paste of strawberry plants and pepper, which is to be diluted for use in sweet wine. There are few diseases of which the history is so obscure as that of the small-pox. This obscurity arises partly from the difficulty of identifying the disease under the names which seem to have been given to it at different times. In our own language it was formerly called simply the *pockes*, the plural form of a word which signified nothing more than pustules. In the Anglo-Saxon treatise of which we are now speaking, we find two or three receipts against the 'pockes' (wip poccum), which is perhaps the same disease we call small-pox, although, by the number and simple character of the prescriptions, it would appear either not to have been very prevalent, or else to have possessed a less dangerous character than that which it assumed in later times. On the appearance of the first symptoms of the disease, bleeding is ordered, and a full bowl of melted butter is recommended to be taken inwardly; if the pustules be broken out, the physician is directed to pick them all out carefully with a thorn, and to pour a drop of wine or alder syrup in the place, which process was to prevent them from leaving any marks. The terrible effects of hydrophobia seem not to have been much known at this time; two or three receipts are given against the bite of mad dogs, but they are all very simple, the most remarkable being plasters of boiled onions, ashes, fat, and honey, or of plantain, mulberries, and fat, to be applied to the wound."

FINE ARTS.

SIGNOR BOZZONI'S MODELS.

We have lately had the pleasure of seeing, at the Imperial Hotel in Covent Garden, specimens of statues and bassi relievi, modelled by Signor Bozzoni, a pupil of the celebrated Finelli, of Rome. The statues are those of St. Peter and St. Paul, and the subjects of the bassi relievi are "Our Saviour going to Calvary," and "The Entombment;" the former being part of an intended series of sixteen statues (twelve apostles, and four martyrs); the latter being part of an intended series of

eighteen bassi relievi, illustrating the history of Jesus Christ; which are to be the ornaments of a Roman Catholic Church lately built, in his own grounds, by Constable Maxwell, Esq., of Everingham Park, Yorkshire. Signor Bozzoni is evidently an artist of very superior talent. Purity and simplicity are the characteristics of his style. There is nothing in it of that violence and exaggeration which are too often mistaken for indications of genius. If the design be completely carried into effect, and more especially if marble be eventually chosen as the medium of its execution, the church in question will be the most splendid and attractive edifice of its kind in the country.

The Royal Academy.—On Tuesday, the affairs of the Royal Academy were debated in the House of Commons; when, on a division on Mr. Hume's motion to enforce obedience to an order of the house for the production of accounts, &c. for the last three years, it was negatived by a majority of five, the numbers being thirty-eight to thirty-three. It seems likely that, under such circumstances, the Academy must either yield some matters to popular opinion, or make itself entirely independent of popular claims, by building a Home for itself; for which, indeed, it fortunately possesses ample funds.

ORIGINAL POETRY.

PAINTING.

WHEN first from heaven the King of light
Call'd Beauty into birth,
He painted on the waters bright
The images of earth.
The trees in lofty glory drew,
Beside the low and bending flower,
And o'er its living surface threw
Sublimity and power!

What morn unconscious Love strayed near,
She started all amazed;—
Advanced—retired—in bashful fear—
Then, trembling, blushing,—gazed!
She moved—a form, yet nobler graced,
The magic waters swift did yield;
A mirrored hand stole round her waist,
And Painting stood revealed!
Thus Love, immortal Art, first found,
And sought her colours true,
From every bud and blossom round
That slumbered 'neath the dew:
Yet vain she toiled, until she brought
Her untought pencil to that tide,
And deeper inspiration caught
Along the river-side.

For frail was Painting's hand, and rude,
Imperfect to her will;
And Nature's awful magnitude
Frowned at her mimic skill.
But softened—mellowed—in the stream
The majesty of Nature moved;
More like the visions of a dream,
When dreams were what she loved!

Thus Science nursed by Beauty grew,
Its mighty leaves unfurled;
Its fame-ascending branches strew
A grandeur round the world.
And mute must Poetry appear,
Dethroned and crownless stand apart;
And Sculpture seem but Death when near
Love's miracles of Art.

For Time, who never spent an hour
As in Love's beauteous clime,
Taught her—to aid the pencil's power—
To snatch a grace from Time!

And faithful to the voice that made
His golden sands in music run,
O'er Painting Time ne'er cast a shade
But it some feeling won!

A universal language spread
Its eloquence afar,—
Grand as the living Scripture read
In every burning star:
From shore to shore the marvel ran,
And every holier impulse woke;
And every passion known to man
Unrivalled Painting spoke!

All feelings—sympathies, full fraught
With truth, great Art, were thine!
The illumination of all thought,
Or earthly, or divine!
The fine creations of the sense
Took bodied form and life from thee,
The vision and the influence
Of Present Deity!

Behold!—the dreadful whirlwinds toss;
The rocks from earth are torn;
See,—Jesus bleeds upon the cross,
And Horror hides the morn!
We turn again,—'tis Raffaele brings
The risen Saviour to our eyes:—
Oh, for those archangelic wings
That mount Jehovah's skies!

Still may that Lyre whose chords are hues,
Whose language Nature finds,
Its mighty influence diffuse
To charm and teach all minds!
May Painting, whose delights sublime
Exalt each land where man hath trod,
Still inspiration through all time
Seek from Creation's God!

Manchester, July 17th.

CHARLES SWAIN.

BIOGRAPHY.

OLD SAUNDERS.

AT the extreme age of ninety-one, our old friend and showman has this week been gathered to his fathers, at Lambeth. It is with a curious sympathy that we record his death; for do not we remember him in his provincial perambulations, when yet the first of our school lessons were, like his great feats, being imprinted on our mind? and do not we recollect, with gratitude, that he even permitted us to mount his beautiful horses and canter round the ring? The sawdust is now applied to a different purpose: the coffin is his circus now. Then there were in those days the lotteries, far superior in interest to any thing we have since seen upon the stage. A waistcoat; a pair of corduroy—(what a laugh when they were drawn and proclaimed!); a live goose (another comic clap-trap, quite equal to Liston at his best); a sheep (like the finale to the "Village Lawyer"); a silver watch!—ah, how time has flown since then! Shakspeare and Maoready together could not produce such a sensation; Stanfield could draw nothing so delightful as one of these prizes. And he had two fine sharp lads to ride (one of them was afterwards killed by a fall) in their gay silk jackets and tight whites. To be allowed to speak to them was an honour. The Fool, "motley's your only wear," was far above taking so great a liberty with: but Saunders had a pretty family, at least a boy, who followed in his career, and a girl with red rosy cheeks and fair flaxen hair. He was himself a stout and muscular figure, well-looking, and worthy to be the parent of such children, the dispenser of such benefits, the proprietor of such an equestrian stud, the

director of such entertainments, the lord and master of such an establishment.

The booth system, we fancy, succeeded the horsemanship; and, sooth to say, mountebanking, a name in disrepute with the elder and upper circles, though dear to the young and lowly. In this he was the generous rival of Richardson, of famous character; and was, like him, well known to almost every corner of the British dominions. Wherever they came, they contributed to the harmless gaiety of "the masses;" and, in verity, it is our solemn and earnest wish that the masses had more of similar pleasures now to amuse and occupy their few brief hours of relaxation and recreation. The newspapers state that his later years were not so prosperous as his earlier days, with all their fluctuations and various fortunes; but we saw him occasionally driving about in a very small pony-chaise, and hope he had enough for the common comforts of life in his old age. He was very grateful for kindness; and we are convinced that it would be no undeserved tribute to him to inscribe upon his tombstone—

Here lies an Honest Man.

THE DRAMA.

Her Majesty's Theatre.—The new ballet of the *Gipsy*, in which F. Elsaler takes a part similar to that of Taglioni in *La Gitana* (the one being Scotch and the other Bohemian), is chiefly worthy of notice on account of the fine scenery painted for it by Grieve. The view of the Old Town and Castle of Edinburgh, is, in particular, a splendid and picturesque composition, and does infinite credit to the talents of the artist. It is droll enough to observe that a new heresy has sprung up among our dramatic critics, in consequence of the perfection to which scene-painting is now carried. They hold that it is too good; and seem terrified lest the painter should eclipse the poet!!

English Opera House.—The only dramatic novelty of the week is *The Devil's Opera*, brought out here with musical force and beauty; and in a manner that does credit to native talent. Miss Rainforth, Frazier, Burnett, and Butler, sustain the parts of *Pepino*, *Vallardi*, *Herman*, and *Perendelli*; and the other characters are adequately filled; especially *Diavoleto*, by Wieland, whose antics and gambols are seen to great advantage on this stage. *Lover's farce of The Hall Porter* improves on repetition, and bids fair to have a long run. It is terse and humorous, and its hits at some of the follies of the day tell with excellent effect.

VARIETIES.

Thuggee Extraordinary!!—A very nearly fatal occurrence arose (we are sorry to say) out of our last *Gazette*. A clerk, in a public office, was so deeply interested in the subject of *Thuggee*, reviewed in our preceding sheet, that he would be trying to throw the *roomal*, in order to ascertain how that noose could produce death so instantaneously as is there described. With a penny-piece in one corner of his handkerchief he induced a junior to allow him to practise on his neck, when, at the very first cast, he brought his victim to the ground so satisfactorily strangled, that it took five minutes to restore him to life and animation. The alarm of our official *Thug* may be imagined.

Improved Tuning-Fork.—We have been favoured with an inspection of an approved tuning-fork, invented and constructed by a mechanic of this place. The peculiarity of the improved fork is, that it is not like the common fork, restricted to the production of one note,

but may be made to produce any note within the compass of two or three octaves. This is accomplished by extremely simple means. A stop is made to slide stiffly between the prongs, the effect of which is to check the vibrations in the portion of the prongs included between the stop and the handle. The effective length of the prongs being thus diminished, the rapidity of their vibrations is increased and the pitch consequently raised. In the fork now before us—the fundamental—that is, the note yielded without the use of the stop—is D below the first line of the staff; and the positions of the stop, for the production of the other notes of the scale, up to C (beyond which the inventor has not yet carried his divisions) are of course in the first instance ascertained by trial. It appears to us that this improved fork requires only to be known to come into general use.—*Aberdeen Journal*.

Muster Owen.—We see, by the Nottingham journals, that this youthful dramatic aspirant (the son of our ladylike and graceful actress, known by the name of Miss Beaumont, and now Mrs. Owen,) has been performing *Macbeth*, *Richard III.*, and other leading parts, in a manner, not only to elicit great applause from his audiences, but also to wake tributes of poetry from admiring bards. Mrs. Owen has also returned to the stage, and besides the charms of song, has been performing, in genteel comedy, with much success. Young Owen is, we believe, under thirteen years of age.

Lady Hester Stanhope.—The death of this remarkable person is announced in the newspapers. Her ladyship died at Djoun on the 23d of June. Her influence among the Arabs was great; and from many Eastern travellers we have had interesting accounts of her establishment and conduct.

A MS. on Chivalry and the Tournament having been offered to a publisher in the Row, the author was advised to transfer it to Charles Tilt. Charles Knight, however, might have a claim.

Magazine for the Blind.—When the British Association met at Bristol, we gave an account of the exhibition of the embossed letters for the instruction of the blind, and of the facility with which they availed themselves of this ingenious and humane invention. We rejoice to have received No. I. of a magazine in the same form, for the gratification of the unfortunate individuals deprived of the blessing of sight. It is a very laudable design, and will, we trust, be successful. There are ten pages, and the price only sixpence.

Box.—A new work, on "an entirely new plan" is announced by Mr. Charles Dickens (Box!!); the first No. to appear in March. "Nicholas Nickleby" now approximates its close, and we are glad to see that the last No. is to contain a portrait of this most popular author, from the pencil of Maclise, and engraved by W. Flinden. Genius and talent, illustrated by genius and talent, is always most acceptable.

Mary Ashley, the Factory Girl, No. I. (London, Johnson; Manchester, Banks and Co.), apparently intended as a counterpoise to Mrs. Trollope's "Factory Boy," and to rescue the manufacturers from the cruel imputation it attempts to fasten upon them. Both, we fear, will look more to invention and exaggeration than to truth and reality.

Vampire.—One of the large vampire bats, familiar to Guiana and other torrid regions, has been imported alive, and taken to the Surrey—
• Simpkin and Marshall, London; Moxon, York.

Zoological Gardens; where, as bats are not very fond of light, it must be excessively annoyed by Mount Hecla, and other luminous nuisances.

Impromptu.

Of Drury Lane Theatre the farce has much fun;
The committee, though hard, were but calms versus *Buen*;
And with all their disputes, degradations, and jobbing,
Honest George has proclaimed the *Lease* bangs all *Robins*.

LITERARY NOVELTIES.

Mr. William Carleton, the author of "Confessions of Harry Lorrequer," announces a new Irish national story, in monthly parts, to be entitled, "Chronicles of Ballymacrulkane."

"*Langages of Abyssinia*."—Some letters appear in the "Journal Asiatique" of Paris for April, from M. d'Abbadie, who has been paying a philological visit to Abyssinia, and who appears to have collected some valuable information respecting the dialects of Eastern Africa. He has demonstrative proof that the group of languages called Amharica, Ilmorma, Somalial, Shaha, Taltal, &c., are derived immediately from the Semitic family, without having all the characters. The Hhabab, a dialect hitherto unknown, ought, he says, to be placed beside that of Tograri (Tigré), which is itself a dialect of the ancient language of Ethiopia, whose affinity with the Himyaritic has been demonstrated by Lieut. Wellsted. He has collected a vocabulary of the Moosawwoos (Mansuh) dialect, which, he says, is Semitic, and altogether distinct from the Arabic and the Tigré. He penetrated into the continent, through the country of the Shonoo, of whom only a single tribe, that of the Hassorta, is known to Europeans. From the traditions current amongst these wandering people, and from a vocabulary of their language, he has established their remote affinity with the Semitic stock. After a long residence at Tigré, where he studied the Amharica, he proceeded to Gondar, where, by the help of the Amharica, he applied himself to the Ilmorma, a dialect common to the Gallas of Central Africa. From Adwa, he proceeded by a new route to Mansuh, and thence to Mokha, where he studied the language of the Somalis, which is connected with the Ilmorma. The tradition of the Somalis confirms that of the Gallas, that all these nations issued from the South of Arabia. M. d'Abbadie was on his way to France, accompanied by a Gall and an Abyssinian, with each of whom he could converse in their own tongues. Their appearance would corroborate his remarks on the ethnography of Eastern Africa, deduced from the physical form of the inhabitants.—*Asiatic Journal*.

LIST OF NEW BOOKS.

Natural History of Fish, Amphibians, and Reptiles, by W. Swainson (3 vols.), Vol. II. (forming Vol. II. of Dr. Lardner's Cyclopaedia), fcap 8vo. 6s.—Memoirs of the Life and Labours of R. Morrison, D.D., by his Widow, 8 vols. 8vo. 84s.—C. C. Babington's Outline of the Flora of the Channel Islands, 18mo. 4s.—The Mabinogion, Part II., edited by Lady C. Guest, royal 8vo. 8s.—Observations on Education and Mis-Education, by T. A. Readwin, 8vo. 2s. 6d.—Histoires Intéressantes, by Thuillier, square, 2s. 6d.—The Dublin Medical Press, Vol. I. 4to. 14s.—The Fountain of Life, by the Rev. T. Jones, of Creaton, 12mo. 4s. 6d.—The Young Farmer's Manual, by J. Main, 12mo. 6s.—Sir H. Cavendish's Report of Debates on Canada in 1774, 8vo. 10s.—Poverty, Mendicity, and Crime; Compiled from W. A. Miles's Report to the House of Lords, 8vo. 5s.—Lockhart's Life of Sir W. Scott, Vol. V., fcap. 5s.—Mrs. Hemans's Life and Works, Vol. III., fcap. 5s.—Blackwood's Atlas of Scotland, imperial 8vo. 21s.—Experience, Tales for Youth, by G. J. Shaw, 18mo. 2s. 6d.—Present State of the Turkish Empire, by Marshal Marmont, translated, with Notes, by Sir F. Smith, 8vo. 12s.—Jarman and Hytherwood's Conveyancing, Vol. V.: Mortgages, royal 8vo. 25s.

Rain fallen 1 inch, and .675 of an inch.

Edmonton.

CHARLES HENRY ADAMS.

TO CORRESPONDENTS.

We like "Juvenal's" spunk; and if such a spirit can allow him to live to do the work he promises, we dare say it will be bitter enough, though we shall not be able to regret it.

We cannot accept anonymous criticisms.—Answer to the notice of a "Lady's Religious Tractate."—ERRATUM.—In our last, noticing the very clever acting of Mr. Horton as a Cockney footman, in the *Ball Porter*, at the English Opera, his name was misprinted Horton. When praise is so well deserved, we should be loath to throw it away on a misnomer.

NEW AND USEFUL WORKS,
Published by Longman, Orme, and Co.

ILLUSTRATIONS OF MECHANICS.

By the Rev. H. MOSELEY, M.A. F.R.S.
Professor of Natural Philosophy and Astronomy in King's College.

In fcap 8vo. price 4s. cloth, lettered.

* * * The above is the First Volume of a Series, entitled *Illustrations of Science*, by Professors of King's College, London; forming a Course of Instruction in Natural Philosophy and Natural History.

"These illustrations are delightful reading, as all such combinations of the *utile* and the *dulce* must afford. The perusal of this volume has given us more unalloyed gratification than any other contribution to our standard literature, which we have met with for a great number of years."—*St. James's Chronicle*.

A Dictionary of Arts, Manufactures, and Mines.

Containing a clear Exposition of their Principles and Practice.
By Andrew Ure, M.D. F.R.S. &c.

In 1 closely and beautifully printed vol. 8vo. containing 1948 pages, and illustrated with 191 Engravings on Wood. Price 3l. 10s. strongly bound in cloth, lettered.

"We consider this work, as a whole, a great boon to the British manufacturing public."—*Athenaeum*.

School Botany;

Or, an Explanation of the Characters of the principal Natural Classes and Orders of Plants belonging to the Flora of Europe, in the Botanical Classification of De Candolle. For the Use of the Students preparing for their Matriculation Examination in the University of London.

By John Lindley, Ph.D. F.R.S. L. &c.
Fcap 8vo. with 168 Woodcuts, 6s. cloth, lettered.

"The authority of De Candolle, backed by the author's own peculiar and original views on the subject, carry this work far above the ordinary character of manuals."—*Monthly Review*.

The Vegetable Cultivator.

Containing a plain and accurate Description of every Species and Variety of Cultivable Vegetables, with the most approved Modes of Cultivating and Cooking them.

By John Rogers, Author of "The Fruit Cultivator."
In fcap 8vo. price 7s. cloth, lettered.

"The most useful work of the kind that has fallen under our notice."—*Conservative Journal*.
"A complete and intelligent manual for the kitchen garden."—*Spectator*.

McCulloch's Commercial Dictionary.

Illustrated with Maps and Plans, with a new and enlarged Supplement, bringing down the information contained in the Work to January 1880.

A new edition, price 50s. boards.

Medical Notes and Reflections.

By Henry Holland, M.D. F.R.S. &c.
Physician Extraordinary to the Queen. 8vo. 12s.

Progressive Education.

3 vols. fcap 8vo. 12s. cloth.

"We have seldom read a work containing more just views of what education should be. It is worthy the attention and serious perusal of every teacher, every parent, every magistrate, or divine, in the kingdom."—*Educational Magazine*.

Longman, Orme, and Co.'s Catalogue of Second-hand Books for 1880, is now published, containing useful and valuable Works in various Languages. Price 2s.

A Prospectus of a Series of Encyclopædias,

each complete in 1 vol. is just published, by Messrs. Longman and Co., and may be had, gratis, of all Booksellers in Town and Country.

"Such a series will, when completed, form a valuable library of practical knowledge. The specimens we have already seen are such as do great credit to the Publishers who formed the design, and to the Authors who have executed the respective divisions."—*Athenaeum*.

NEELE'S ROMANCES OF HISTORY.

In 1 vol. cloth gilt, price 4s. 6d.

ROMANCES OF HISTORY, TALES, and POEMS.

By HENRY NEELE.

Also, uniform with the above, price 4s. 6d.

LECTURES ON ENGLISH POETRY, from Chaucer to Cowper, by the same admired Author, with his Life and Portrait.

London: Joseph Thomas; T. Tegg; and Simpkin and Co.

With beautiful Illustrations, price 2s. 6d.

EXPERIENCE: a Series of Tales.

By G. JOHN SHAW.

John Hearn, 81 Strand.

THE LAW AND THE COURTS OF LAW.

ADVENTURES OF AN ATTORNEY IN SEARCH OF PRACTICE.

Dedicated to all Attorneys who want a Client, and to all Clients who want an Attorney.

"One of the most interesting books of the season."—*Sun*.
"We heartily wish it an extensive circulation."—*Atlas*.
Saunders and Otley, Publishers, Conduit Street.

NEW PUBLICATIONS,
Printed for Longman, Orme, and Co.

A NEW WORK by the COUNTESS OF BLESSINGTON.

DESULTORY THOUGHTS and REFLECTIONS.

In fcap 8vo. price 4s. cloth, lettered, gilt edges.

"An elegant little work, which we do not hesitate to characterize as the best of Lady Blessington's productions."—*St. James's Chronicle*.

"We recommend these Thoughts and Reflections, not only to the female sex, but to our own, for each may profit by it."—*Age*.

"These terse and well-digested aphorisms are as remarkable for their moral value, as for their elegant and graceful sitting."—*Conservative Journal*.

NEW WORKS by MR. JAMES.

The Gentleman of the Old School.

3 vols. post 8vo.

"The style is racy, the scenes graphically sketched, and the whole story so crowded with stirring incidents, that the attention is kept alive to the end of the last volume."—*Conservative Journal*.

"Rarely, if ever, has Mr. James proved himself more successful than in the volumes before us."—*Court Journal*.

Blanche of Navarre; a Play.

Price 4s.

NEW NOVEL BY MRS. BRAY.

Trials of the Heart.

By Mrs. Bray.
Authoress of "Trelawny," "Warleigh," &c.
In 3 vols. post 8vo.

"Mrs. Bray can, at will, probe the human heart, and lay it open in its most passionate moments; and this she has accomplished in the tales before us."—*Monthly Review*.

"A collection of short and striking tales, written in Mrs. Bray's best manner."—*Metropolitan Magazine*.

THE SOCIAL AND POLITICAL STATE OF SWEDEN.

A Tour in Sweden.

By Samuel Laing, Esq.
Author of "Three Years' Residence in Norway."
8vo. price 12s. cloth.

"Mr. Laing is a man of acquirement, experience, knowledge of affairs, and great ability. His statistical facts are selected with judgment, and commented upon with sagacity. His disquisitions are those of a man of sense, and besides such things as these, the work contains many striking descriptions and comparisons—the result of immediate observation, or deductions from inquiries and experience."—*Spectator*.

MR. WATERTON'S LAST WORK.

Essays on Natural History.

By Charles Waterton, Esq. of Walton Hall.
With View of Walton Hall, and Autobiography of the Author.
New edition, price 12s. cloth.

"A delightful little volume. Mr. Waterton is evidently one who loves the pursuit of natural history for its own sake."—*Quarterly Review*.

GUIDE TO NORTH WALES.

The Rev. W. Bingley's Excursions in North Wales.

Including Aberystwith and the Devil's Bridge.
2d edition, with Corrections and Additions, made during Excursions in 1880, by his Son, W. R. Bingley, B.A.
In 1 vol. 8vo. with new and accurate Map, by J. and C. Walker, price 12s. cloth, lettered.

THE AUGUST NUMBER.

Price Half-a-Crown, embellished with Illustrations by George Cruikshank.

BENTLEY'S MISCELLANY,

Edited by W. H. AINSWORTH, Esq.

Contains—

Jack Sheppard, by W. Harrison Ainsworth, Epoch the Third, 1784.

Chap. 5. The Disguise

Chap. 6. Winifred receives Two

Proposals

With Two Illustrations by George Cruikshank.

The Crayon Papers. Legend of

Nicey Hollow, by Washington

Irving

The Dog Hospital of Paris. By

Mrs. Goreau

The Phantom Funeral, a Story of

the Second Night, commu-

nicated by the Author of "The

Subalterns"

Vincent Eden, or the Ozonian

Richard Bentley, New Burlington Street.

In 1 vol. small 8vo. price 7s. cloth.

THE LIFE-BOOK of a LABOURER.

By a WORKING CLEVERMAN.

"It is the pious offering of one who may be deemed a proper follower in the footsteps of that good man, Legh Richmond."—*Atlas*.

"This volume reminds us forcibly of that most delightful of all biographies, 'The Doctor,' to which, indeed, it is little, if at all inferior."—*Bruce*.

"The author has wisely based the tales contained in this volume on authenticated biography or historical fact, and the work challenges, by its intrinsic merits, no small share of public approbation."—*Half Pence*.
Smith, Elder, and Co. 65 Cornhill.

The New Number of

THE METROPOLITAN

for August, will contain—

1. Recollections of Ancient Literature. By a Barrister.
2. Sketches of Jerusalem. By C. G. Addison, Esq.
3. Lines to a Fading Geranium.
4. Oliver Goldsmith's Nephew.
5. Lord Killikelly. By Abbott Lee.
6. The Colony of Newfoundland.
7. The Season for Remembrance.
8. The Death of the Course.
9. Law and Lawyers. A Spectator's Ticket.
10. An Attorney in Search of Practice.
11. The Ruined Church. By Mrs. Ably.
12. The Pillar of Siva.

Reviews, Notices of New Works, &c.

Saunders and Otley, Publishers, Conduit Street.

Agents—for Ireland, J. Cumming, Dublin; for Scotland, Bell and Bradfute, Edinburgh.

UNIFORM WITH THE CHILD'S LIBRARY.

No. 1177.

LONDON, SATURDAY, AUGUST 10, 1839.

PRICE 8d.
Stamped Edition, 9d.

REVIEW OF NEW BOOKS.

The Present State of the Turkish Empire. By Marshal Marmont, Duc de Raguse. Translated, with Notes and Observations on the Relations of England with Turkey and Russia, by Lieutenant-Colonel Sir Frederic Smith, K.H., of the Corps of Royal Engineers. 8vo. pp. 341. London, 1839. Ollivier; Simpkin, Marshall, and Co.

A MORE opportune contribution to the consideration of present circumstances of importance to nations, as well as a repository on which future historians may look back with interest, has not appeared for some time. The skill and experience of Marshal Marmont, and the facilities for observation afforded to him, give weight to his authority; and, surely, the existing state of things between Turkey and Egypt, and the powers of Europe, give equal weight to the subject. Another advantage is apparent in the ability of the translator and editor, Sir F. Smith, who was not only competent to the task as a linguist, but still more as an officer of skill and talent, who has himself enjoyed ample opportunities of forming his own judgment on every point discussed in the original. His notes are accordingly very valuable.

The volume itself is an episode in the extended travels of the Duke of Ragusa, who, tired of the ennui which attended his expatriation at Vienna, in the year 1834, set out on a tour through Hungary, Transylvania, Southern Russia, Turkey, Syria, and Egypt. On all these regions *a coup d'œil* is thrown; but the immediate application of the work is to the condition and prospects of the Turkish empire, the fall of which the marshal holds to be speedy and inevitable:—

“An administration,” he declares, “calculated to create and husband resources does not exist in Turkey, and is no longer suited to her.* The elements required are absolutely wanting: these are a mass of enlightened individuals, with enlarged and steady views, and unwavering resolutions; but this country probably contains not one such being. Every thing would require to be remodelled at the same moment, for all is under the influence of ignorance and corruption; and whatever Mahmoud may desire in this respect, he is not fated to attain his object, of which he has but a vague and undefined conception. The weakness and misery of his dominions must therefore increase, and the internal disorders that will arise on the first unexpected outbreak will cause the destruction of a state whose real existence is confined to a single city, and its name will be erased from the list of European nations. The creation of the power of Mehemet Ali is in itself a dismemberment of Turkey, with which the new state forms a remarkable contrast; and although this is not the moment for a full consideration of the subject, yet I feel bound to offer a few remarks upon it. All the requisites for organisation of which Turkey is deficient have suddenly sprung up in Egypt, and are earnestly and unremittingly employed towards

the attainment of the desired object. Mehemet Ali is accused of being covetous, and of exposing the people to be plundered by his officers; but by no other course than that adopted could he procure the funds required for his operations. I speak neither of the justice nor philanthropy of the question, but of its policy. The viceroy has already made great progress in his undertaking, by establishing a system of obedience, and a perfect police, in the extensive country under his control; his name is respected, and such is the opinion entertained of him, that opposition to his will never enters the mind even of those who were previously the most inclined to independence or rebellion. This is the foundation of regular order; for the first step in civilisation is to produce submission. The second important act of Mehemet Ali was the change he originated in the agriculture of Egypt, by inducing the ‘Fellahs’ to adopt a system from which crops of infinitely greater value have resulted. If success continue to attend his various improvements, and if the works he has commenced answer his expectations, there will be a further increase of revenue, although even now seven times the amount this country yielded to the French troops at the period they occupied it. Manufactures, suited to the natural circumstances of Egypt, have been established, and are prospering; they suffice for the necessities of the government and the wants of the people, and compete with those of other nations in the European markets.* Those who take a contracted view of the present position of this country, might be led to conclude that the pacha alone profited by these riches, because the bulk of the inhabitants are not supposed to derive any immediate or tangible benefit from them; but it should be remembered, that the Arabs are desirous of rising in the scale of nations, by becoming independent of Turkey; and that as the wealth acquired by their ruler, and applied to promote his political power, is in furtherance of this object, the people are so far positive participants in the improved condition of the state. When the necessities of Mehemet Ali shall have been satisfied—when his enterprises shall have ceased to require the immense expenditure they now demand—when articles of commerce shall have increased in value—and when the pacha shall purchase what he now requires as imposts—there will be an improvement in the condition of the whole community, who will be disposed to assist in supporting his government. Mehemet Ali has accomplished another great object in establishing an efficient force. He now possesses an army, the formation of which presented extraordinary difficulties; for the extreme repugnance of the natives of the East to a regular military service, and their prejudices on this head, are well known: yet he has

* “It is to be regretted that the author has not here given some statement of the nature and amount of these manufactures. If of great extent, it might be supposed that they would have found their way to England; but the most recent returns furnished to the British parliament by the custom-house, specify that the only imports from Alexandria are cotton, wool, flax, hempseed, senna, and natron, no manufactured goods being mentioned.—T.”

overcome all these obstacles by acting discreetly, and by adopting such preliminary measures as were calculated to insure success; satisfactory results have been already obtained, and he is following a course that must lead to their extension and improvement. Officers are instructed, in the various schools, for all branches of his service; and the confidence he reposes in a clever man, who is the foundation-stone of the edifice he is rearing, is a guarantee that, in a very few years, his army will bear a comparison with those of Europe.* The means at Mehemet Ali's disposal, for the establishment of his naval force, were limited, and the materials of which it was composed, as well as the national circumstances at the time of its formation, were unfavourable to its success; nevertheless it is as formidable as the exigencies of his situation require, and being well appointed and efficient, it holds out a promise of performing valuable services. The basis of a durable power has thus been effectually laid, since this government has not only sufficient internal force and energy to establish and maintain order and create resources, but possesses such means of enterprise and defence as are calculated to protect it from aggression, acquire the respect of other nations, and secure its independence. In the accomplishment of this great work, Mehemet Ali has had the assistance of a compact and homogeneous population, full of intelligence, remarkable for its self-respect, strongly predisposed to enthusiasm, laborious though excitable, sober, contented, and obedient. In short, the people are ready to promote the interests of their country, and susceptible of any form or impression they may be required to take. The condition of the Christian population of Syria is favourable to the advance and stability of the new power, being assembled in the same district, well disciplined, sufficiently numerous to be useful, but not to dream of independence, and so much in dread of Turkish tyranny as to be willing to draw tighter the bonds which connect it with the government of Egypt. By attention to the interests of this people, it may be incorporated with the Arab state, and add materially to its strength.”

Such are the general views of the author; to which are appended those diversities which form the sometimes opposing opinions of his translator—between whom the judgment will be improved.

Before going more to the Turkish question, we must extract a few curious portions from the earlier travel; and first, of the breed of horses in Hungary:—

“In Hungary, the duke passed through Tzougrad and Szentes, the former inhabited by thirty thousand, and the latter by ten thousand peasants. He halted for the day at Mezo-Hegyess, the Austrian establishment for improving the breed of horses. An idea may be formed of its magnitude, by merely stating that the land appropriated to it is fifteen leagues in circuit. It is surrounded by a broad and deep ditch, and is sheltered by a wide plantation of

* “The person alluded to is M. Seve, an ex-officer of the French army, whose Malometan name is ‘Salyman Pacha.’—T.”

* “This appears an extraordinary statement; for it would be difficult to understand how such an administration as the author alludes to could be unsuited to the state of any country.—T.”

trees. When the Austrian cavalry was supplied with horses exclusively from this establishment, there were no less than twenty thousand colts here. But the object of the government is now merely to breed stallions, both at this place and at Bobolna, for the provincial dépôts, where a total number is kept up of nearly two thousand. This is effected by means of an annual supply from all the government establishments, towards which Mezo-Hegyes contributes two hundred and fifty. For this purpose one thousand brood mares and forty-eight stallions are kept there. In the operations of husbandry there are employed two hundred mares and six hundred oxen, with three hundred and sixty ploughs. When the provincial dépôts have received their full complement of young horses, the surplus is either sold or sent as remounts to the cavalry. At present the stock of stallions, brood mares, and foals at Mezo-Hegyes, amounts to three thousand. The whole of this establishment is under the direction of an officer with the rank of major, who is assisted by two subalterns, and has under his command eleven hundred and seventy men. The advantages of the Austrian system is, that not only a very superior description of horse is obtained for the cavalry, but that the breed is improved throughout the whole country."

Passing into Southern Russia, and being received with great distinction by the excellent Prince Woronzow, the marshal gives the following detailed account of the Russian army:—

"The Russian military force is organised in regiments of seven battalions: six of these are kept in a complete and effective state, four being attached to what is termed the acting army, and two to the army of reserve. The seventh battalion is stationed in the district allotted for the recruiting of the regiment, and generally is not only incomplete, but composed of very young soldiers. At these dépôts, the new levies are partially clothed, and instructed in their first military duties; they are afterwards forwarded to the battalions of reserve, where their equipments and the remainder of their clothing are supplied, and where their instruction is completed. The active army consists of 288 battalions, each containing a thousand men. They are formed into divisions and corps d'armée, in the following manner. The four active battalions of four regiments, compose a division of sixteen battalions: three divisions form a corps d'armée, consisting, of course, of forty-eight battalions: there are six such corps d'armée, making up the above stated total of 288 battalions. The fifth and sixth battalions of the regiments which compose a corps d'armée, are formed into a division of reserve. This division consists, therefore, of twenty-four battalions, and three divisions of reserve; that is to say, seventy-two battalions form a corps d'armée of reserve. There are two of these corps, one under the command of Count de Witt, and the other under the orders of the Grand Duke Michael. The former is called the corps of Marshal Sacken, and the latter of Marshal Paskewitz. Each battalion of the reserve contains in time of peace 500 men, so that the strength of the army of reserve amounts at present to a fourth of that of the active army, that is to 72,000 men, making a grand total of 360,000; and this is independent of the corps of guards and of grenadiers, each of which is sufficiently numerous to form in itself a corps d'armée. From the facility which the present plan of recruiting the Russian army affords of rapidly increasing its number,

ical strength, a considerable improvement has been effected in the system that previously existed. So great, however, is the extent of the empire, that in order to have such a disposable force as might be required on any sudden emergency, the government professes it expedient to keep the army in a complete and effective state. Its present strength is as follows. In the first place, there is the Imperial Guard:—this corps is composed of six divisions; three of which are of cavalry, and three of infantry. These divisions consist of twelve regiments of cavalry, twelve regiments of infantry, one battalion of sappers, one battalion of marines, one battalion of chasseurs, one battalion of invalids, four batteries of horse artillery, and twelve batteries of foot artillery. In the Imperial Guard each regiment of cavalry has seven squadrons, and the regiments of infantry have three battalions each. Secondly, there is the corps of grenadiers, consisting of one division of light cavalry, of four regiments; of three divisions of infantry, comprising twelve regiments; of two batteries of horse artillery, and of fifteen batteries of foot artillery. In the grenadiers, the regiments of light cavalry are composed of eight squadrons, and the infantry regiments have four battalions, of which three belong to the active force, and one to the reserve. Then there are, as has been already stated, six corps d'armée, each consisting of one division of light cavalry, of four regiments; three divisions of infantry, each composed of four regiments, and each regiment having four battalions for active service; two batteries of horse artillery, and fifteen batteries of foot artillery. The total strength of the six corps d'armée is therefore twenty-four regiments of light cavalry, seventy-two regiments of infantry, twelve batteries of horse artillery, and ninety batteries of foot artillery. There are also three corps of cavalry of reserve; consisting of twenty-four regiments, and twelve batteries of horse artillery. Besides the force above stated, there are two corps d'armée of infantry of reserve. Each of these corps d'armée has three divisions, and each division has twenty-four battalions, so that there are 144 battalions of infantry of reserve. The undermentioned corps are raised for special service. 1st. The corps of the Caucasus, consisting of one regiment of dragoons; three divisions of infantry; and sixteen batteries of foot artillery. 2d. The corps of Orenburg, consisting of one division of infantry, of sixteen battalions; and sixteen batteries of foot artillery. 3d. The corps of Siberia, of one division of infantry. 4th. The corps of Finland, of one division of infantry. There are also, for the service of the interior, ten battalions of sappers; fifty for duty in the fortresses, and one division of horse-artillery of reserve, consisting of nine batteries. Besides these there are four battalions of horse-artillery of the Don, two of the Black Sea, two of Orenburg, and two of Siberia. The Cossack force is as follows:—Fifty-six regiments of the Don; twenty-one of the Black Sea; twelve of the Caucasus; two of the Danube; one of Azoff; three of Astracan; three of Baschkirs; two of Navropol; twelve of Ural; twenty of Orenburg; twelve of Siberia; two of Little Russia. Total, 146 regiments of 800 men each; that is to say, 116,800 Cossacks. In addition to the force comprised in the foregoing details, there are at St. Petersburg, as models for the rest of the army, a regiment of cavalry; one of infantry; a battalion of sappers; and two batteries of foot, with one of

horse-artillery. There are also four regiments, each consisting of four battalions, formed of the sons of soldiers, who are educated and instructed in such a manner as to qualify them for being placed as non-commissioned officers, in the regiments of the line. Hence it appears that the total strength of the Russian infantry is upwards of five hundred thousand men. A Russian cavalry regiment consists of six effective squadrons of 180 men each; making a total of 1440 men, independently of a squadron which is kept at the regimental dépôt. Thus if the marshal's statement be correct as to the number of regiments of cavalry in the Russian army, the effective strength of that branch of the service may be computed to be upwards of ninety thousand men, exclusive of the Cossacks. Judging from the expense incurred in maintaining the armies of the other great powers of Europe, it might naturally be concluded that the finances of the Russian empire would be seriously crippled in having to bear the expense of an army of the magnitude above stated; but the cost of a soldier in any other European country is so much greater than it is in Russia, that she has no real cause for apprehension on this account. The following statement, which is founded on data afforded by Marshal Marmont, will shew the relative expense to their respective countries of the English, French, Prussian, Austrian, and Russian soldier:—viz.

120 English soldiers cost as much as	538 Russian soldiers.
120 French	340 ditto.
120 Prussian	340 ditto.
120 Austrian	312 ditto."

The author speaks very highly of the genius of Suwarow, and mentions several instances of his superior talents; and he adds:—

"What a change, Marshal Marmont observes, has this part of Europe undergone, and what progress has Russia made since that time! Hordes of Tartars from the Crimea then united with the Turks, and carried war to the banks of the Dnieper: Ukraina was a province of Poland, and the Polish armies acted in conjunction with the Turks and Tartars; but now Russia is the mistress of Poland; menaces the very heart of Germany; and has her advanced guards at the gates of Vienna and Berlin; while she politically holds possession of Constantinople. It is only since the reign of Catherine II. that Russia has been of importance in the balance of power; and it is by efforts of consummate skill, both in diplomacy and arms, that she has raised herself to her present state of eminence."

The ensuing remarks treat of the Russian navy, and of the measures which Russia might adopt in the event of a war:—

"The experimental squadron, or, as it may more properly be termed, the squadron of instruction, consisting of five ships of the line and five frigates, had just returned to port when Marshal Marmont reached Sebastopol. He went on board one of the former, which he describes as being a magnificent vessel, and he appears to have been greatly struck by the surprising improvement which had evidently taken place in the Russian ships since he had first seen them at Cattaro, about twenty-eight years before the period of his tour. He then considered the Russian fleet as only fit to cope with the Turks; whereas, he now conceives that it might measure itself with any fleet in Europe. With all due deference to the marshal's judgment in military matters, we must, as Englishmen, be permitted to doubt his knowledge in nautical affairs, and to withhold our acquiescence from this unsupported opinion, until the

Russians have either proved themselves to be thorough seamen, or have gained a victory, when fairly matched, against the fleet of one of the maritime powers of Europe. The naval force of Sebastopol is under the orders of Admiral Conzani, who, although educated in Russia, is by birth a Greek. It was he who, during the last war with Turkey, performed the signal service of taking possession of Sinopoli, which enabled the commander-in-chief of the Russian forces to form a dépôt, in the Gulf of Bourgas, for ammunition and provisions. At the period of the marshal's visit, there were under repair, in the port of Sebastopol, six line-of-battle ships; these, with the Warsaw, which was hourly expected from Nicolajeff, and the experimental squadron, consisting of five line-of-battle ships, made a total of twelve, as the strength of this fleet, which is called the Sebastopol fleet. It is held in a state of readiness for active service, and for receiving on board the division of the army cantoned in the Crimea, and amounting to sixteen thousand men. If political events should render it expedient, the embarkation of these troops could be effected in eight-and-forty hours; the fleet might get under way on the following day, and, owing to the prevalence of the northerly winds in the Black Sea, it would most probably reach the mouth of the Bosphorus in about five-and-forty hours from the time of sailing: so that, within five days of the order being issued for the departure of the fleet, and in all likelihood before the ambassadors of England and France would know that such a movement was in contemplation, the Russian armament would arrive at Constantinople. Marshal Marmont observes that the humiliation of Turkey has rendered it impossible that there should be a conflict in this quarter between any other European power and Russia; for that, on the breaking out of hostilities, or even when circumstances might give reason for supposing that such an event was possible, the Russians would make the Dardanelles a point in their frontier. The naval force of the Russian empire is divided into two fleets: the larger, consisting of thirty ships of the line, is stationed in the Baltic, and the smaller, consisting of only fifteen, in the Black Sea. The marshal states that these numbers should be reversed, because he deems it impolitic for the Russians to risk a battle with the English fleet in the Baltic (in which opinion we fully concur), and therefore injudicious of them to retain so many ships in that sea; but he is of opinion that by making Sebastopol the rendezvous of a powerful fleet, Russia would be enabled to impose laws in the Mediterranean. With this design, he would recommend that the Russian fleet in the Black Sea should consist of thirty sail of the line, and that, on the breaking out, or on the mere expectation, of hostilities, it should be stationed in the Dardanelles, where it would have the support of the batteries and forts which defend that passage, and at the same time be near its resources. He thinks the combined fleet of England and France might thus be kept in check, as, in that position, the Russian fleet would be in readiness to enter the Mediterranean whenever circumstances might give it the numerical superiority. In making these observations, Marshal Marmont, of course, assumes that no circumstance of provocation, or any suspicion of the aggressive intentions of Russia, would induce the other powers of Europe to break through or disregard the treaty of Unkiar Skelessi; and that, therefore, the Russians are likely to have, until the expiration of that treaty, full and undisturbed

sovereignty of the Black Sea, with the right of excluding from the Dardanelles the ships-of-war of every other foreign nation. That under such a state of things the Russian fleet should occupy these straits, we freely admit; but it cannot be imagined that England, who is deeply interested in this matter, would allow herself, in a case of extremity, to be bound by the treaty in question. On the contrary, we may feel confident that she would take the justifiable step of forcing the Dardanelles and Bosphorus, and of making herself mistress of the Black Sea, from which she should never afterwards permit her fleets to be excluded.

"After (he adds elsewhere, when in Constantinople,) having thoroughly examined the arsenal, the capudan pacha proposed that I should visit the fleet, consisting of five ships completely armed; I accepted the invitation to go on board the flag-ship only, the Mahmoudie, a three-decker, carrying 130 guns. Although a magnificent vessel, she is considered rather short for her other proportions. In all Turkish men-of-war, the guns are of brass, and that metal is elaborately used in their interior decoration. I was much surprised at the wonderful expertness of the crew of the Mahmoudie, composed exclusively of Turks. By command of the capudan pacha, they performed the small-arm and great-gun exercise, manned the yards, went aloft, and came down by the stays, the whole being done with a celerity and precision that could not have been surpassed by the smartest French sailors. On expressing my admiration to the capudan pacha, he replied, 'It is by dint of painstaking and punishment that I have brought things to this state, for there is not one of these fine fellows who has not received five hundred blows with the stick.' It would appear that a severity of corporal punishment is suited to the Turkish character, for these men are thoroughly drilled in their exercise, and well disciplined; and as there were at the period of my inspection only eight invalids in this crew of 1200 sailors, we may infer that, in the system adopted, there is nothing injurious to health. The capudan pacha is evidently a man of energy and resolution, and he is the only one of that stamp with whom I met at Constantinople. If severe punishments, and measures of violence bordering on brutality, succeed with Turkish seamen, the same treatment might be equally efficacious with the army; and some military chief, resembling the capudan pacha in character, might follow it, and render an inestimable service to his country."

In the military portion of the work there is a strenuous argument in favour of the lance being used by heavy dragoons, and the sabre by light cavalry. There is also a particular account of the Russian cavalry colonies. Their strength amounts to 28,000 men.

But we must now be content to glean a few brief notices of various matters which struck the traveller in Turkey. At Constantinople, he says:—

"We inspected an establishment for the reception of insane persons. It is every where, and under all circumstances, a painful and distressing sight, but here it is a dreadful one. All that a barbarous stupidity could invent, of the most monstrous description, to aggravate the wretched state of these unfortunate beings, prevails in this place. The insane are bound with cords, chained, and beaten; and their lives are passed in anguish and convulsions. There is not a single instance of one of them being restored to reason; and those who may not have been altogether deprived of their

senses before admission, are soon entirely bereaved of them."

The following anecdote is told of one of the leading men now in Turkey:—

"Achmet Pacha, who is the commander-in-chief of the guards, is intelligent, obliging, well-disposed, and diffident; but he is indebted for his rapid elevation to the caprice and favour of his master. These are, as they ever have been, the grand introductions to important offices. Achmet Pacha, like the generality of Turks, commenced life as an artisan. He was a shoemaker and also a waterman of the port. I was told that while on an embassy at St. Petersburg, where he was treated with great respect, he on one occasion went to see the barracks; when, in passing a workshop of the guards, he could not resist the desire of displaying his ability, and quitting the cortege that accompanied him, he surprised every one by taking up a shoemaker's awl and stirrup, and giving an immediate proof that he had lost none of his former dexterity."

And further on—

"After returning home, Namik Pacha called to acquaint me that the Grand Signor would receive me on the following day; therefore, on the 25th, at half-past one o'clock, I repaired to the palace of Beyler-Bey, then the imperial residence. In this delightful habitation, which is of recent construction, the apartments are spacious, elegant, and cool. It is beautifully enclosed, on one side by the terraces formed on the mountain, and on the other by the sea. Though the style of architecture is irregular, it is pleasing to the eye, and possesses an agreeable character of originality. The harem is composed of pavilions, having their gable ends in a line with those of the main structure; and handsome kiosks, placed at various levels on the terraces, are pleasing objects in the scenery around. Mahmoud has a passion for building, which his architect encourages by causing it to be predicted that the sultan should not die during the construction of a new palace; for God would not choose, by calling him away, to leave his works unfinished: hence, before the completion of one palace another is commenced."

With this we must conclude, and only recommend all that relates to Syria in this volume to the same attentive perusal which the whole of it so eminently deserves.

Tea; its Effects, Medicinal and Moral. By G. G. Sigmond, M.D., F.S.A., F.L.S., &c. 12mo. pp. 144. London, 1839. Longman and Co.

TEA.—It would be difficult to find a subject of more general interest with all ranks of readers; and we could heartily wish that every individual who takes tea, if they cannot afford to go to the price of Dr. Sigmond's book upon it, would at least buy a copy of the *Literary Gazette* in which it is reviewed. We should immediately relieve the bank from its necessity for dealing with the French for specie; hand over to the chancellor of the exchequer a sum

* "That alluded to by the author is probably the one attached to the mosque of Soliman, and if so, is deserving of the description he has given of it. But it should be borne in mind that insanity is often believed to be feigned in Turkey, in the hope of escaping the punishment deserved for some offence, and that prisoners are often sent to these 'Timar Khans' by the judges, instead of the infliction of the more rigorous sentences justified by law.—(T.)"

† "A few months since the sultan appointed Achmet Pacha to the office of capudan pacha, or high admiral. He has hoisted his flag in the finest ship-of-war, and should the fleet be engaged he will have to command it. It is easy to conceive how skillfully it will be managed, and what confidence the crews can have in such a chief."

sufficient to render him easy about deficiencies by penny-posting; and import all the teas of Assam to be distributed gratis among the meritorious Tea-totallers of the British empire, giving Lord Stanhope a chest extra as a reward for heading the last procession. But, joking apart, this is a very curious and excellent little book, not only supplying the able opinion of a clever and intelligent physician upon an article in universal use, but telling us more of the article itself, its cultivation, manufacture, natural history, and other particulars than we have ever met with before in travel, essay, or cyclopædia. We shall, therefore, devote a considerable portion of our periodical to make its leading points better known; and in doing so will, we flatter ourselves, both amuse and instruct every one of our readers.

The origin of the work was an address delivered by Dr. Sigmund at the opening of the last session of the Royal Medico-Botanical Society, to which he is professor of Materia Medica. The reception it met with induced him to enlarge and publish it; and as he is enthusiastic in his admiration of the herb, it could not have been infused in a warmer manner:—

“Nicolaus Tulpus was about the first medical man who wrote professionally upon tea, but they were not original observations; they were the opinions of the most eminent men he had collected to give to the world. But in 1678 appeared the first edition of a book which speedily ran through three large impressions, and had a considerable influence upon the introduction of tea: it was entitled ‘Cornelio Bontekoe, Tractaat van het excellenste Kruid Thee.’ Although this work was, from the extravagance of its commendations on tea, severely handled by some of the critics, it was translated into many languages, and quoted as the highest authority. He pronounced tea to be the infallible cause of health, and that if mankind could be induced to drink a sufficient quantity of it, the innumerable ills to which man is subject would not only be diminished, but entirely unknown. He thinks that 200 cups daily would not be too much. He is said to have been rewarded for his judgment by the liberality of the Dutch East India Company. Heydentrik Overcamp, who wrote the life of Bontekoe, states that his inducement to write was to recommend himself to his fellow-citizens, and to defend himself against his colleagues, who did not follow his theory or his practice. Etmüller recommended tea as a fine stomachic, cephalic, and antinephritic. Pechlin wrote a dialogue on tea, which he entitled ‘Theophilus Bibaculus;’ and several poets indulged themselves in its praise. Petit wrote a poem; Peter Franciscus, two anacronisms; Heinrich, a Doric melody; and our poet-laureate, Tate, joined the melodious bands. Whilst it met with so much approbation, there were likewise those who were not equally satisfied with its merits. Boerhaave, Van Swieten, and others, attempted to stem the tide that was setting in its favour, but they have proved themselves incapable of resisting the general impression; for no beverage that has ever yet been introduced sits so agreeably on the stomach, so refreshes the system, soothes nervous irritation after fatigue, or forms a more grateful repast. It contributes to the sobriety of a nation; it imparts all the charms to society which spring from the enjoyment of conversation, without that excitement which follows upon a fermented drink. Raynal has observed, that it has contributed more to the sobriety of the Chinese than the severest laws,

the most eloquent harangues of Christian orators, or the best treatises of morality. The people on the Continent are reverting to the habit of tea-drinking, which they had abandoned during the long war, when they were shut out from the possibility of obtaining it, and therefore sought a substitute in coffee. In Holland, in Germany, and in Russia, tea is much prized; whilst even in France, where for so many years coffee was considered the only good beverage, and was used either strong or mixed with milk, according to the meal that was taken, our favourite shrub is beginning to be as much in use as long-established custom has rendered it in England.”

And of its introduction into our country we are informed:—

“The introduction of tea-drinking into England has been ascribed to Lord Arlington and Lord Orrery; and the year 1666, the *annus mirabilis* of Dryden, has been ascribed as the exact date: but in the diary of Mr. Pepys, secretary to the Admiralty, the following is registered,—‘I sent for a cup of tea, a Chinese drink, of which I had never drank before.’ In the diary of Henry, earl of Clarendon, there is a memorandum,—‘Pere Comptel supped with me, and after supper we had tea, which he said was really as good as any he drank in China.’ The first historical record, however, is an act of parliament, passed in the year 1660, 12 Car. II. c. 23, which enacts, that a duty should be laid of eight-pence per gallon on all tea made and sold in coffee-houses; which were visited twice daily by officers, whose duty it was to ascertain what quantity had been made. In 1668, the Court of Directors, in the despatch to their factory at Bantam in Java, ordered them ‘to send home by their ships one hundred pounds’ weight of the best *tey* they could get;’ and the following year appears the first invoice of tea received by the East India Company, amounting to two canisters of 143½ lbs. The Directors had previously presented to her majesty the Queen, who, as Princess Catherine of Portugal, had been in the habit of taking this beverage, twenty-two pounds of tea. It is to this present on her birthday that Waller has alluded in the beautiful lines that may be so often quoted, both for their merit and for the historical facts recorded by them. There is a curious bill preserved in the British Museum in a volume of pamphlets, collected by George III. and presented by George IV., which is well worthy of being reprinted, as the first account of the early use and the estimation in which tea was held. It unfortunately has no date; but from the price it may be fairly inferred that it was printed about 1660. There is every reason to believe that Garway has been gradually changed into Garraway, and that he must have been the predecessor of the present holder of that well-known coffee-house:—‘An exact Description of the Growth, Quality, and Virtues of the Leaf Tea, by Thomas Garway, in Exchange Alley, near the Royal Exchange, in London, Tobaccoist, and Seller and Retailer of Tea and Coffee. Tea is generally brought from China, and groweth there upon little shrubs and bushes, the branches whereof are well garnished with white flowers, that are yellow within, of the bigness and fashion of sweet-brier, but in smell unlike, bearing thin green leaves, about the bigness of scordium, myrtle, or sumack; and is judged to be a kind of sumack. This plant hath been reported to grow wild only, but doth not; for they plant it in their gardens, about four foot distance, and it groweth about four foot high; and of the seeds they

maintain and increase their stock. Of all places in China this plant groweth in greatest plenty in the province of Xemsai, latitude 36°, bordering upon the west of the province of Namking, near the city of Lucheu, the Island de Ladrone, and Japan, and is called ‘Cha.’ Of this famous leaf there are divers sorts (though all one shape), some much better than others, the upper leaves excelling the other in fineness, a property almost in all plants; which leaves they gather every day, and drying them in the shade, or in iron pans, over a gentle fire, till the humidity be exhausted, then put close up in leaden pots, preserve them for their drink tea, which is used at meals, and upon all visits and entertainments in private families, and in the palaces of grandes; and it is ascribed by a padre of Macao, native of Japan, that the best tea ought to be gathered but by virgins, who are destined for this work, and such ‘*quæ non dum menstrua patiuntur: gemmæ quæ nascuntur in summitate arbusculæ servantur imperatori, ac præcipuis ejus dynastiis: quæ autem infra nascuntur ad latera, populo conceduntur.*’ The said leaf is of such known virtues, that those very nations, so famous for antiquity, knowledge, and wisdom, do frequently sell it among themselves for twice its weight in silver; and the high estimation of the drink made therewith hath occasioned an inquiry into the nature thereof amongst the most intelligent persons of all nations that have travelled in those parts, who, after exact tryal and experience by all ways imaginable, have commended it to the use of their several countries, and for its virtues and operations, particularly as followeth; viz.—The quality is moderately hot, proper for winter and summer. The drink is declared to be most wholesome, preserving in perfect health until extreme old age. The particular virtues are these:—It maketh the body active and lusty. It helpeth the headach, giddiness and heaviness thereof. It removeth the obstructions of the spleen. It is very good against the stone and gravel, cleaning the kidneys and ureters, being drank with virgin’s honey, instead of sugar. It taketh away the difficulty of breathing, opening obstructions. It is good against tipitude, distillations, and cleareth the sight. It removeth lassitude, and cleanseth and purifieth acrid humours, and a hot liver. It is good against crudities, strengthening the weakness of the ventricle, or stomach, causing good appetite and digestion, and particularly for men of corpulent body, and such as are great eaters of flesh. It vanquisheth heavy dreams, easeth the frame, and strengtheneth the memory. It overcometh superfluous sleep, and prevents sleepiness in general, a draught of the infusion being taken; so that, without trouble, whole nights may be spent in study without hurt to the body, in that it moderately healeth and bindeth the mouth of the stomach. It prevents and cures agues, surfeits, and fevers, by infusing a fit quantity of the leaf, thereby provoking a most gentle vomit and breathing of the pores, and hath been given with wonderful success. It (being prepared and drank with milk and water) strengtheneth the inward parts, and prevents consumption; and powerfully assuageth the pains of the bowels, or griping of the guts, and looseness. It is good for colds, dyspepsia, and scurvy, if properly infused, purging the body by sweat and urine, and expelleth infection. It driveth away all pains of the colic proceeding from wind, and purgeth safely the gall. And that the virtues and excellences of this leaf and drink are many and great, is evident and manifest by the high esteem and use

of it (especially of late years) among the physicians and knowing men of France, Italy, Holland, and other parts of Christendom; and in England it hath been sold in the leaf for six pounds, and sometimes for ten pounds, the pound weight; and in respect of its former scarceness and dearness, it hath been only used as a regalia in high treatments and entertainments, and presents made thereof to princes and grandees, till the year 1657. The said Thomas Garway did purchase a quantity thereof, and first publicly sold the said tea in leaf and drink, made according to the directions of the most knowing merchants and travellers in those Eastern countries; and upon knowledge and experience of the said Garway's continued care and industry in obtaining the best tea, and making drink thereof, very many noblemen, physicians, and merchants, and gentlemen of quality, have ever since sent to him for the said leaf, and daily resort to his house in Exchange-alley aforesaid, to drink the drink thereof. And that ignorance nor envy may have no ground or power to report, or suggest that which is here asserted, of the virtues and excellencies of this precious leaf and drink, hath more of design than truth, for the justification of himself and the satisfaction of others he hath here enumerated several authors, who in their learned works have expressly written and asserted the same, and much more, in honour of this noble leaf and drink, viz. Bontius, Riccius, Jarricus, Almeyda, Horstius, Alvarez Sameda, Martinivus in his 'China Atlas,' and Alexander de Rhodes in his 'Voyage and Missions,' in a large discourse of the ordering of this leaf, and the many virtues of the drink, printed at Paris, 1653, part x. chap. 13. And to the end that all persons of eminency and quality, gentlemen and others, who have occasion for tea in leaf, may be supplied, these are to give notice, that the said Thomas hath tea to sell from sixteen to fifty shillings in the pound. And whereas several persons using coffee have been accustomed to buy the powder thereof by the pound, or in lesser or greater quantities, which if kept two days loseth much of its first goodness; and forasmuch as the berries, after drying, may be kept, if need require, some months; therefore all persons living remote from London, and have occasion for the said powder, are advised to buy the said coffee-berries ready dried, which being in a mortar beaten, or in a mill ground to powder, as they use it, will so often be brisk, fresh, and fragrant, and in its full vigour and strength, as if new prepared, to the great satisfaction of the drinkers thereof, as hath been experienced by many in this city, which community, of the best sort, the said Thomas Garway hath always ready dried, to be sold at reasonable rates. All such as will have coffee in powder, or the berries undried, or chocolata, may, by the said Thomas Garway, be supplied to their content; with such further instructions and perfect directions how to use tea, coffee, and chocolata, as is or may be needful, and so as to be effectual and operative according to their several virtues. There is no date to this handbill; but as Hanway ascertained that the price was 60s. per lb. in 1660, this bill must have been distributed about that period."

This curious document is a history in itself; but we may learn more of it from the following extracts (not extracts of tea, but of Dr. Sigmond):—

"The tea-plant is evidently indigenous in many of the provinces of China, and in various situations serves in the fields as a hedge-shrub; but there are particular localities in which

neither labour, skill, nor ingenuity, are spared to bring it to the state of the highest perfection of which it is capable. It exists, indeed, in different parts of the Eastern hemisphere, but it is only in China that it has been extensively cultivated; for, although the Javanese assert that they have within the limits of their empire a shrub which is far superior to that which is found in China, we have no evidence of the fact, nor has any exportation been made of that of which they have so loudly boasted. The plant evidently flourishes over the greater portion of the Chinese empire; and there must be varieties produced by cultivation, which are not known in Europe, but which are said to be in high estimation amongst those people who can afford to purchase them. That which is best known to the European, and which, indeed, seems grown and prepared for the supply of our markets, is the produce of the central and the maritime provinces of China, forming the richest and finest portions of the empire. From these, too, the most valued productions, and the more highly esteemed manufactures of various articles of dress and of luxury, are obtained. The demand for exportation has necessarily increased its cultivation; and it is now successfully reared in many situations where it was formerly unknown or entirely neglected. The provinces of Fokien, of Keang-nan, of Chek-eang, of Kiang-si, and Kung-soo, yield the largest proportion; and the English resident is led to believe that from them the best supply is obtained; but the provinces immediately around Peking afford that which is preferred by the luxurious citizen; and from those which border upon the Tartarian region, the Russian and the Muscovite draw their supplies, which are of a kind and of a character which are much to be prized by the amateur of tea. It is in Fokien, or in "the happy establishment," that a very large proportion of that tea which is the ordinary beverage of the tea-drinkers of this country is grown. The shrub here acquires great luxuriance; is diligently watched over; its farmyards, its drying establishments, are on a scale of great magnitude; and it furnishes us with a sound black tea, of sufficient aroma, strength, and taste, to gratify the palate. *

"When the shrub has grown about three years, the leaves are ready for picking. This is done with the greatest care: they are not plucked by handfuls, but each leaf separately. They are thus, although the process be somewhat tedious, enabled to collect, in the course of the day, fifteen pounds. The following account has been given of a tea-farm which supplies the imperial family with imperial or bloom tea:—"The plantation is inclosed with hedges, and likewise surrounded with a broad ditch for further security. The trees are planted to form regular rows, with intervening walks. Persons are appointed to superintend the place, and preserve the leaves from injury or dirt. The labourers who are to gather them, for some weeks before they begin, abstain from every kind of gross food, or whatever might endanger communicating any ill flavour. they pluck them, also, with no less delicacy, having on thin gloves." During the tea harvest, it would seem, great attention is paid to the diet of the husbandman. In the common tea-plant, the commencement of the leaf-gathering takes place in the early spring; and three different crops are obtained during the summer. Scarcely, in the first instance, has the leaf attained its growth, and whilst it is yet budding into life, than the picking commences; and the tea will be fine in proportion to the tender age of the leaf: the most agreeable aroma and the most

delicious flavour are then obtained from it. A soft white down covers the first leaflets, which is called, in the Chinese language, pa-ho, and hence our name pekoe, the most exquisitely flavoured of those teas with which we are acquainted. Trees, until they reach the sixth year, furnish this tea. A few days' longer growth supplies us with the black leaf pekoe. In the month of May, the leaves that have grown since the first gathering, having arrived at maturity, are stripped from the trees: these form the souchong—the season-chong,—"the small or scarce sort." About six weeks after this, there is a third gathering of the new crop thrown out; and from the Chinese word, koong-fou, signifying labour or assiduity, springs our term congou. From this a particular part is selected, called kien-poe, a selection which is known to us under the name of campou. The tea familiar to us under the appellation of bohea should be the produce of the district from which it derives its name: it is a rough preparation of the later-grown leaves, which yield a beverage of little strength and of inferior flavour. Green teas undergo the same kind of harvest. From the tender leaflets is produced hyson; and a very expensive kind, loontsing, is more particularly prized: it was called yutein, 'before the rains'; whilst hyson is a corruption from: 'flowery spring.' The gunpowder is a hyson gathered with great attention, and rolled with much nicety and care; indeed, it would appear to be a selection of the more delicate leaves. The coarser and yellower leaves remaining after this selection are called hyson skin. The twankay is the last-gathered crop, and consists of an older leaf, in which less attention is paid to the manipulations. The judgment shewn in collecting the leaves at the various seasons evinces a great knowledge of vegetable organisation, and of the succession of phenomena which are developed during the progress of life. It is in the early spring that the sap or vegetable blood has little to convey to the leaf but the mucilaginous principle, and that aroma, peculiar to each vegetable, of whose existence we are by its effects rendered sensible, but of which our means of examination are so limited. On the first bursting into existence, leaves and flowers are endued with an evanescent odour, which art has attempted to fix, and to diffuse through other bodies. Upon this much of the flavour of the plant depends; and if we would wish to obtain all that strikingly characterises the vegetable, we must gather it as soon as this principle is at all developed. At a later period of the year, not only has the aromatic principle been exhaled, but the mucilaginous properties are exchanged. A great proportion of the earthy phosphates exist in all plants in the month of May, but they are much diminished as the year advances.

"Many experienced persons believe that the green tea is altogether artificially prepared; whilst others consider that the black is the same leaf, but that it undergoes the process which gives it colour, and renders it much milder in its effects. The Chinese themselves rarely drink green tea, and then only the produce of particular farms, which have obtained a high character. The leaves of all of them are much more liable to be changed by the action of the atmospheric air, and very speedily lose that beautiful bloom which, amongst many tea-drinkers, is highly valued. The heavier these teas weigh, the better are they imagined to be; and they are much oftener scented by some other leaf: and great is the attention of the factor given to attract his customer by the

fragrance and by the appearance. He often gives an additional dryness to the leaf after damp weather; and generally, immediately before he brings it in the market for sale, he again dries it, to give the crispness which should belong to it. It often happens that those teas which strike the eye at Canton, are found, on their arrival in America, where they are very much esteemed and generally preferred to the black, not to satisfy the consumer, from the changes that have occurred during the voyage. These teas are often dried over the fumes of burning indigo; and a very small quantity, mixed with powdered gypsum, is delicately sprinkled over them, which adds to the colour. Different modes of flavouring the tea are likewise practised: the blossom buds of fragrant flowers are thrown amongst the finest teas. In the lountaing pekoe these are very discernible. After torrefaction has taken place in the iron pans destined for that purpose, the dried leaves are delicately touched with a camel-hair pencil, which has been dipped in spirituous solutions of resinous and aromatic gums; and for this purpose a number of children are employed. The Chinese distinguish two kinds, more particularly the boui, or bou tcha, and the soumlo, which are reserved for the invalid. They likewise make it into cakes; and of this sort there is a particular kind, called mandarin tea, which is an extract from the leaves. This is rarely imported into England. Sir Anthony Carlisle presented, however, a very fine specimen of it to the Royal Medico-Botanical Society; it was in the form of a dry, solid, blackish mass, easily broken and reduced to powder. There are other varieties which occasionally find their way into this country as presents. Ning-yong, pouchong, orange pekoe, hung muey, have become within a few years familiar to us; and there is little doubt other names will soon be made known to us, and their characters will be investigated and compared. Amongst those that are brought to the Canton markets are, quongsow, heeh ke, kee cheem, sing kee, quang tay, quang fat, quang tack, ka kee, cheem chunn, wa chunn, yock chunn, and euphonous names, which may hereafter be as well known to us as any of those which, from their long reputation, have become standard teas. There is a tea known throughout the north of Europe under the name of caravan tea, and in some places under that of kaiser-tea, or the emperor's tea, imported into Russia by way of Kiachta. It is seldom found in this country; the leaf is remarkably large, not much dried, and of a deep black colour, mixed with footstalks of the plant, and occasionally slender twigs of the smallest dimensions. These teas are in all respects superior in point of taste and flavour to those consumed in England, France, and Holland. They are not the produce of the provinces which furnish these markets, but of the centre of China. They are conveyed by land, to which much of their superiority is to be attributed, as the sea voyage deteriorates all teas, and causes them to lose their strength, freshness, and flavour. As Mr. Crawford has observed, the difference between the teas coming sea-wise, and those brought by land through Kiachta is so remarkable, that it is no exaggeration to say, that a pound of the last goes as far as two pounds of the first. * *

"There was an idea once prevalent, that the colour of the green tea was to be ascribed to the drying the leaves on copper; but nothing can be more unfounded than such an opinion, as the pans, one of which was sent home by an officer of the East India Company, are of cast-iron. That copper may be detected in tea is

true; but Bucholz has shewn that it exists in several vegetables; indeed, there are proofs that it enters into the composition of a great proportion of animal and vegetable matter. It is found in coffee in very striking quantities; from ten ounces of unroasted coffee there may be obtained, by the proper manipulations, a dense precipitate, which will coat two inches of harpsichord wire with metallic copper. And he who eats a sandwich has much more to fear from the poisonous effects of this metal, than the drinker of green tea; for the two slices of bread, the beef, and the mustard, all have been proved, by the examination of the chemist, to be capable of forming in the stomach a metallic crust; indeed, the only safe food would be potatoes, for in three pounds no copper could be traced."

The lower orders of people speak of spending their coppers: they never dreamed that in return they were swallowing copper; but science teaches us many new things. Another instance of it is in making the Black one Green:—

"That damaged black leaves can be manufactured into green, an anecdote related by Mr. Davis fully proves. The remission of the tea duties in the United States occasioned, in the years 1832 and 1833, a demand for green teas at Canton, which could not be supplied by the arrivals from the provinces. The Americans, however, were obliged to sail with cargoes of green teas within the favourable season; they were determined to have these teas, and the Chinese were determined they should be supplied. Certain rumours being afloat concerning the manufacture of green tea from old black leaves, Mr. Davis became curious to ascertain the fact, and with some difficulty persuaded a Hong merchant to conduct him, accompanied by one of the inspectors, to the place where the operation was carried on. Upon reaching the opposite side of the river, and entering one of these laboratories of factitious hyson, the parties were witnesses to a strange scene. In the first place, large quantities of black tea, which had been damaged in consequence of the floods of the previous autumn, were drying in baskets with sieve bottoms, placed over pans of charcoal. The dried leaves were then transferred in portions of a few pounds each to a great number of cast-iron pans, imbedded in chunam or mortar, over furnaces. At each pan stood a workman, stirring the tea rapidly round with his hand, having previously added a small quantity of turmeric, in powder, which, of course, gave the leaves a yellowish or orange tinge; but they were still to be made green. For this purpose some lumps of a fine blue were produced, together with a white substance, in powder, which, from the names given to them by the workmen, as well as their appearance, were known at once to be Prussian blue and gypsum. These were triturated finely together with a small pestle, in such proportion as reduced the dark colours of the blue to a light shade; and a quantity, equal to a small teaspoonful, of the powder being added to the yellowish leaves, these were stirred, as before, over the fire, until the tea had taken the fine bloom colour of hyson, with much the same scent. To prevent all possibility of error regarding the substances employed, samples of them, together with the specimens of the leaves in each stage of the process, were carried away from the place. The tea was then handed in small quantities, on broad shallow baskets, to a number of women and children, who carefully picked out the stalks and coarse or uncurled leaves; and when this had been done,

it was passed in succession through sieves of different degrees of fineness. The first sifting was sold as hyson skin, and the last bore the name of young hyson. The Chinese seemed quite conscious of the real character of the occupation in which they were engaged; for, on attempting to enter several other places where the same process was going on, the doors were speedily closed upon the party."

But one of the most promising and important matters connected with the subject of tea, as it may ultimately make us independent of China for that beverage, and encourage a prodigious colonial improvement besides, is the recent discovery of the plant in Assam, and the importation of samples of it to this country.

"This lately acquired territory of Assam is situated at the extreme north-east frontier of Bengal; it is almost in immediate contact with the empires of China and Ava, from each of which it is separated by a narrow belt of mountainous country, inhabited by barbarous tribes of independent savages, and which may be traversed in ten or twelve days. From this mountain-range navigable branches of the great rivers of Nankin, of Cambodia, of Martaban, of Ava, and of Assam, derive their origin, and appear designed by Nature as the great highways of commerce between the nations of Ultra-Gangetic Asia. Mr. McCosh has contributed to the 'Journal of the Asiatic Society of Bengal' an interesting paper, compiled from original manuscripts placed in his hands by Captain Jenkins, the indefatigable agent to the governor-general on the north-east frontier, and from the letters of Major White, political agent for Assam. He observes that this beautiful tract of country, though thinly populated by straggling hordes, and allowed to be profitless in primeval jungle, or run to waste with luxuriance of vegetation, enjoys all the qualities requisite for rendering it one of the finest in the world. Its climate is cold, healthy, and congenial to European constitutions; its numerous crystal streams abound in gold dust and masses of the solid metal; its mountains are pregnant with precious stones and silver; its atmosphere is perfumed with tea growing wild and luxuriantly; and its soil is so well adapted to all kinds of agricultural purposes, that it may be converted into one continued garden of silk, cotton, coffee, sugar, as well as tea, over an extent of many miles. This valuable tract is inhabited by various races, some of them acknowledge the authority of the Burmese, and some that of China. The Chinese have long carried on a commercial intercourse with the Singphos of Assam, and it would even appear that many thousand maunds of tea are manufactured at a place called Polong, and exported to China. Mung-kung, the chief depot of Chinese trade, situated on the Mugaum river, is from fifteen to twenty days' journey only from Assam. Amongst the recent discoveries made in the remarkable province of Assam, and which lead us to believe that it may rival in its productions the Celestial Empire, are six varieties of silk-worms, three of which are different from the well-known *bombyx mori*, and from the two others indigenous to India, which are worked in Bengal. India may therefore yet provide Europe with a material which may be made to supply the place of cotton and woollen cloth; and the disappointment, which has so often been expressed by so many highly ingenious men, may yet be obviated by the production of a silk, which may vie with any that could be brought to market. A communication on the silk-worms and silks

of Assam by Mr. Hugon, and another upon the indigenous silk-worms of India by Dr. Helper, which was read at two meetings of the Royal Asiatic Society of Bengal, lead to hopes that Assam may yet be found one of the most valuable acquisitions to the British empire. Still further to assist in the development of the vegetable treasures of the province, supplies of coal can be obtained. Three specimens of Assamese coal have been transmitted to Calcutta, which turned out to be of a very respectable quality; they burn with a rich flame, being highly bituminous, and therefore suitable for steam-engine fires. There are four places in which large supplies are found. On the south bank of the Burhampooter river they are easily conveyed to the neighbouring streams, so that steam navigation may be carried on upon a great scale, and thus convey to the most distant points the natural productions of this highly favoured spot. All these points are of the deepest moment to this country; and deserve the most zealous investigation from a government, whose object it must be to diffuse knowledge and truth throughout the civilised world. The tea-plant being distributed so extensively over large portions of Upper Assam, there can be no doubt that an ample supply for European consumption can be obtained thence. Even the present tea-tracts may be enlarged almost to any extent, from the numerous seedlings found amongst the tea-plants, from the great number of seeds that can be collected annually, and from the number of cuttings that may be planted.

"The tea of Assam (continues our author) may be obtained at a cheap rate, when once the establishments for its growth and preparation are placed upon a proper footing. The land is of easy cultivation, and as the necessities of life are purchased at a cheap rate, labour will not be expensive. The cultivators will, of course, at the outset, be obtained from China; but as they have no objection to give their instructions to others, or to answer candidly any questions upon the manufacture in China, there will be no difficulty in instructing labourers capable of undertaking the general and particular management of the plantations. The facility of transmitting the tea to Calcutta is another striking feature in the advantages which Assam presents; and although during the water-carriage down the Burhampooter, a consignment of tea, owing to some faulty arrangement, was damaged, the river affords means of transport, which can be rendered available."

But, alas! "The deceptions practised in the tea trade have been long a subject of great notoriety and frequent complaint; but some of those persons who have written most vehemently against tea-dealers have singularly enough promoted their schemes by giving recipes on the art of mixing one quality of tea with another, and entering into minute rules for improving indifferent teas by the addition of the more highly flavoured qualities. These writers have stated that pekoe is seldom agreeable to tea-drinkers alone, and recommended that one ounce of pekoe should be added to a pound of fine souchong. That souchong or congou may be improved by such means, there can be no doubt; but those who have been in the habit of taking good pekoe would never think of such an admixture. It is, when used unmixed, delicious; it must, however, to be fairly judged of, be tasted without sugar, or with the smallest possible quantity, and likewise without milk. We are almost unacquainted with the delightful qualities of what

may be designated a natural tea. Such changes, such mixtures, and such metamorphoses, go forward in various quarters, that we have an artificial compound of a very doubtful character constantly presented to us. Those who are the advocates of this system, and the artists of this manufacture, excuse themselves on the plea that they must gratify the acquired taste of the people, who are for the greater part fond of a strong beverage, and of a tea that can be tasted in spite of the sugar and milk. They likewise dwell upon the fact, that even in our wines we prefer too often a mixture to a natural growth. Thus the claret, which is so highly prized in England, is a particular manufacture, called *Travail à l'Anglaise*, made up of several stronger wines. We are accused in this country of wanting the power of appreciating those delicate flavours to which some other people are so completely alive. We are declared to be ignorant of the nice art of administering gratification to the palate; strong stimuli are required, whilst the more agreeable, yet lightly flavoured objects escape our attention."

The doctor goes on to commend howqua, as a well-devised mixture of several teas; diverges into some very good general remarks on diet, and says a favourable word or two on behalf of wine and other likeable articles. Into these we can enter no further than to take a brief summary wherewith to conclude:—

"Good wine is a cordial, a good cordial, a fine stomachic, and, taken at its proper season, invigorates mind and body, and gives life an additional charm. There can be found no substitutes for the fermented liquors, that can enable man to sustain the mental and bodily labour which the artificial habits of society so constantly demand. Temperance and moderation are virtues essential to our happiness, but a total abstinence from the enjoyments which the bounteous hand of Nature has provided, is as unwise as it is ungrateful. If, on the one hand, disease and sorrow attend the abuse of alcoholic liquors, innocent gaiety, additional strength and power of mind, and an increased capability of encountering the ever-varying agitation of life, are amongst the many good results which spring from a well-regulated diet, in which the alcoholic preparations bear their just proportion and adaptation."

Sound sense, and, like all the rest of this small tome, well deserving the attention of the public. So no more after this long gossip: of the tea we now take our leave.

The Victories and Conquests of the British Army. By W. H. Maxwell, author of "Stories of Waterloo," &c. 2 vols. 8vo. London, 1839. Bentley.

WE know of no writer whose style is better adapted for a work of this kind than Mr. Maxwell. It may, *par excellence*, be called the "belligerent style." It is striking, forcible, dashing, smart, and sparkling. A roll of the artillery of words is succeeded by the rattle of musketry; the noise ceases, and the smoke clears off; and we have the clearest idea possible of a skirmish or a siege, a battle or a storm. So much for the general effect; and as for the particular details, in so far as we are capable of forming a judgment on military matters, they are very impartial and candid. The author's object not being critical commentaries, but descriptions of those scenes in which the British arms have been renowned during the last half-century, he has not found it necessary to involve himself in comparisons and opinions. He has related the events, and the circum-

stances connected with them, in the liveliest manner; and although there are plentiful proofs of judgment in discriminating the bold from the rash, and the skillful from the incompetent, yet the whole gives rather the idea of a series of excellent paintings than the laborious efforts of a mere historiographical penman.

The volumes open with a slight sketch of the critical state of England, military and political, when the war in India commenced against Tipoo Sahib, Seringapatam and Assaye mark the first great returns of victory to our standards, after a very dubious intercourse for a long number of years, in which America was lost and other vexatious results attended several of our national expeditions. The famous Egyptian campaign, and the death of the fine old warrior who commanded there, furnish the next themes; and are in turn followed by the war at the Cape of Good Hope, and the glorious struggle in the Peninsula. As a specimen of the author's style (already alluded to), the following remarks on the victory of Salamanca will suffice; and also show how well he can appreciate the merits and consequences of the transactions upon which he has employed his pen:—

"Salamanca, whether considered with regard to its merits as a battle, or its results as a victory, stands foremost among the Peninsular contests. Many and peculiar traits distinguish it from every previous encounter. It was coolly and advisedly fought, by commanders confident in themselves, satisfied with the strength and *matériel* of their armies, jealous of each other's reputation, and stimulated, by every longing after military glory, to exhaust the resources of their genius and experience to secure a successful issue. Nothing could surpass Marmont's beautiful manœuvring for consecutive days, while moving round the British flank, except the countervailing rapidity with which his talented opponent defeated every effort to outflank him, and held the marshal constantly in check. At two, on the 22d, the French marshal threatened an attack; at four, he was himself the assailed. The same mistake that lost Marengo involved ruin and defeat at Salamanca. One false movement, that might have been easily corrected before a slower leader could see and seize the momentary advantage, brought on a crisis that clouded the French destinies in Spain, by removing the delusory belief that their arms should eventually prove invincible. A conflict, close and desperate like that of Salamanca, conferred a sanguinary victory, while it involved a still bloodier defeat. The allied loss, in killed and wounded, exceeded five thousand men; and this, of course, fell chiefly on the British. The Portuguese, comparatively, suffered little—and the Spaniards, being entirely non-combatant, had very few casualties to record. The only post intrusted—and must unhappily—to their charge, was the castle of Alba; and this was abandoned without a shot, leaving Clausel a safe retreat, while its vigorous occupation must have produced his total ruin. The French loss was never correctly ascertained. Two eagles, eleven pieces of cannon, seven thousand prisoners, and as many dead soldiers left upon the field, were the admitted trophies of British victory. Among the commanding officers of both armies, the casualties were immense: of the British, Le Marchant was killed; Beresford, Cole, Leith, Cotton, and Alten, wounded. The French were equally unfortunate. The generals of brigade, Thomières, Ferey, and Desgravières, were killed. Marmont, early in the day, mutilated by a

shell;* Bonnet severely, and Clausel slightly, wounded. The light division, when morning dawned, continued its advance, crossing the Tormes at Huerta; while the heavy Germans, under Bock, overtook the French rear-guard in position on the heights of La Serna, protected by some squadrons of hussars. These were dispersed by a charge of the 11th and 16th—while the heavy brigade rode directly at the squares, and broke them by a furious onset. Numbers were cut down—others saved themselves by throwing away their arms, hiding in the woods, and afterwards joining the retreating columns. In this spirited affair nearly one thousand prisoners fell into the hands of the victors. As a cavalry exploit, that of La Serna has rarely been equalled, and never, in its brilliant results, surpassed. Bock's casualties were comparatively trifling, amounting in killed and wounded only to some seventy or eighty men. Clausel, who commanded *en chef* after Marmont was disabled, retreated with great rapidity. Viewed from the summit of La Serna, the French exhibited a countless mass of all arms, confusedly intermingled. While the range permitted it, the horse artillery annoyed them with round-shot—but, by rapid marching, they gradually disappeared—while, opportunely, a strong corps of cavalry and a brigade of guns joined from the army of the north, and covered the retreat until they fell back upon their reserves. Although Salamanca was in every respect a decisive battle, how much more fatal must it not have proved, had darkness not shut in and robbed the conquerors of half the fruits of victory? The total demolition of the French left was effected by six o'clock, and why should the right attack have not been equally successful? Had such been the case, in what a hopeless situation the broken army must have found itself! The Tormes behind, a reserve of three entire divisions, who during the contest had scarcely drawn a trigger, ready to assail in front—nothing could have averted total ruin—and to the French, Salamanca would have proved the bloodiest field on record. One great error stripped victory of its results. Either the small force by which the Arapiles was defended had been undervalued, or incompetent means employed by Lord Wellington to carry it. Unfortunately a Portuguese brigade had been intrusted with that service. They were admirably led on—conquest on the wing around them—every where the advance of the British was triumphant—their numerical force was five times greater than that of the defenders of the height: but the attack was feebly made, and, on the shew of a determined resistance, as quickly abandoned. This unexpected reverse induced Bonnet's corps to rally, and by it, the fourth division was suddenly and unexpectedly assailed. A plunging fire from the Arapiles fell upon their flank and rear—the tide of battle turned—the fourth gave way—and, as yet untamed by British steel, the enemy cheered loudly and rushed on—and had not Clinton's division been promptly carried into action, it is hard to conjecture what serious results might have arisen from this singular repulse. Finally, the battle was restored and won—but an immense waste of blood and time supervened. The protracted struggle entailed on the victors a desperate loss, and secured the

vanquished from total ruin. Favoured by the darkness, Marmont's routed columns removed themselves from the field, while guns and trophies* were secured by the retiring army, that, with one hour's light, must have fallen into the hands of the conquerors. Still, and with all these mischances, Salamanca was a great and influential victory. Accidental circumstances permitted Clausel to withdraw a beaten army from the field, and a fortunate junction of those arms, which alone could cover his retreat, enabled him, with little loss, to out-march his pursuers, preserve his communications, and fall back upon his reserves. But at Salamanca the delusory notion of French superiority was destroyed. The enemy discovered that they must measure strength with opponents in every point their equals. The confidence of wavering allies was confirmed; while the evacuation of Madrid, the abandonment of the siege of Cadiz, the deliverance of Andalusia and Castille from military occupation, and the impossibility of reinforcing Napoleon during his northern campaign, by sparing any troops from the corps in the Peninsula—all these great results were among the important consequences that arose from Marmont's defeat upon the Tormes. The joy evinced by the inhabitants of Salamanca, at the total discomfiture of their French oppressors, was only equalled by the despair with which the regressive movement of Lord Wellington from the line of the Agueda had previously been witnessed. From all the high grounds about the city, the changes of the fight had been watched with painful anxiety; and when the struggle ended, and the day was won, mules and cars, loaded with refreshments, were despatched from Salamanca to the field of battle, where they arrived before break of day. Hospitals were prepared for the reception of the wounded, and every exertion employed to assuage the sufferings of their gallant allies. High mass was celebrated in the cathedral, and a wild display of popular exultation was every where visible in the streets. All had assumed the appearance of a carnival; and the guitar and castanet were heard at midnight in the same square that, a short period before, had started at 'the beat to arms.' Lord Wellington, who had been present while mass was celebrated for his victory,† without delay commenced his march southward, and moved as rapidly as he could, in the vain hope of overtaking the enemy's rear-guard. Clausel, intending to join the army of the north, fell back on Arivalo; but Joseph Bonaparte, on learning Marmont's defeat, had retreated himself, and thus Clausel was obliged to change his line for that of the Camino Real,

in order to cross the Duero at Tudela. There, too, he failed in effecting his expected junction with the troops that had garrisoned Madrid; and abandoning his hospitals at Valladolid, he fell back at once on Burgos. The British advance was unopposed. Every where the conquerors were received with *vivas*; while fruit, wine, and every refreshment they could command, were liberally supplied them by the Spanish peasantry. At Valladolid, all hope of coming up with Clausel ended; and Lord Wellington halted on the 30th of July, to enable the rear to close. Then turning at once, he quitted his previous route, and took the road to the capital."

The subsequent attempt against Burgos, and the painful retreat from that place, we lament to say, exhibit the darker sides of the picture; but such is the fortune of war. For example:—

"Torquemada had witnessed a most disgraceful scene of riot and confusion on the part of the British. There, immense wine-stores were found and plundered; and it was computed that, at one time, twelve thousand men were lying in the streets and houses in a state of helpless intoxication. Nor was the boasted sobriety of the French proof against the temptation these well-stored cellars presented. On their subsequent occupation of the town, Souham was obliged to stay his march for twelve hours,—for his own corps numbered more drunks than even that of Lord Wellington had done. * * * On the 18th, the retreat was continued, Lord Wellington having given the necessary directions as to the line of march which the different divisions of his army should pursue. His orders were disobeyed, and serious results had nearly been occasioned. Happily, his lordship discovered the irregularity of his subordinate officers in time to avert disastrous consequences. The retreating brigades were completely arrested by a flooded river; and with great difficulty were extricated, from what would have been, very shortly, a desperate and hopeless position. Indeed, so critically were they situated, that the light division, composing the rear-guard, were obliged to cross a gulley by single files, effecting the passage by means of a fallen tree. Here the retreat virtually closed. The weather improved; and having fallen back upon his resources, Lord Wellington was enabled to recruit his exhausted soldiery. Abundant fuel, dry bivouacs, and plentiful rations, produced a speedy change; and men wearied and worn down by privations and incessant fatigue, rapidly regained their health and spirits. The moment the enemy had abandoned the pursuit, the light cavalry and guerilla horse were despatched to search the woods, and rescue such sufferers as survived. Their efforts were attended with success; and more than fifteen hundred wounded or disabled men were brought into the hospitals and saved. The total casualties sustained by the troops during the siege and subsequent retreat of Burgos, were very numerous; and in no point are military writers and official returns more at variance than in the respective estimates they form of the losses of the allies. Where such immense discrepancy exists, it is hard to come to any thing like an accurate conclusion. The French asserted that the allies lost twelve thousand men, *hors de combat*; the English reduced it to little more than twelve hundred. Between these extremes, the mean is more likely to prove correct; and there can be little doubt, all casualties included, that in the siege and subsequent operations to the 29th of October,

* "Mr. Southey, alluding to the eagles taken at Salamanca, gravely observes, 'It is said that more than ten were captured, but that there were men base enough to conceal them, and sell them to persons in Salamanca, who deemed it good policy, as well as a profitable speculation, to purchase them for the French.' Nothing can exceed the absurdity of this statement. The capture of so many trophies could not have been achieved without a correspondent notoriety, and those who were fortunate enough to win them, knew that the gallant deed would secure both honours and promotion. Is it probable, that the daring spirit who rushed into the deadly *mêlée* and seized the proud emblem of victory, would barter it, when won, for a paltry consideration? It is indeed a sweeping slander on British soldiers, to insinuate that out of ten brave and devoted men—for brave and devoted they must have been to do that deed—eight were the sordid wretches which Dr. Southey has depicted them."

† "I was much struck with the simplicity of the Duke of Wellington's attire, who wore a light grey pelisse coat, single-breasted, without a sash, and white neck-handkerchief, with his sword buckled round his waist, underneath the coat, the hilt merely protruding, with a cocked hat under his arm. He stood with his face towards the altar during the prayer offered up for the success of our arms."—LEITH HAY."

* "It broke his right arm, wounded him in the side, and obliged him to be carried from the field in a litter, by relays of grenadiers, as any rougher method of conveyance was intolerable. After the marshal was removed, Clausel supplied his place with high credit to himself, both during the engagement, and in the retreat on Valladolid."

seven thousand men were sacrificed. The retreat from Burgos was not only remarkable for the sufferings they endured, but also for the insubordination exhibited by the soldiery. The mass of the army became drunkards and marauders. The wine-stores in the towns and villages on the line of march were broken into and despoiled of their contents; and multitudes, through inebriety, either perished, or were made prisoners. In Valderoso alone, two hundred and fifty men were found drunk in the cellars; and, of course, they fell into the hands of the French. Drunkenness produced cruelty; and many of the peasantry hitherto well affected to the allies, perished by the hands of infuriated savages, who seemed reckless whether friend or foe became the victim of their ferocity. Napier says, that on the first day's march from Madrid he reckoned seventeen murdered peasants, either lying on the road, or thrown into the ditches. Another mischievous breach of discipline had become very general. Numerous herds of swine were found among the woods, and the soldiers broke from their columns, and commenced shooting pigs wherever they could be found. The spattering fire kept up in the forest by these marauders, frequently occasioned an unnecessary alarm, and thus disturbed the brief space allowed for rest to the exhausted soldiers. Nothing but the greatest severity checked this most dangerous offence; and though some of the delinquents, when taken 'red-handed,' and in the very fact, were hanged in the sight of their guilty comrades, the evil was but partially abated by the example; for hunger had made the starving soldiery indifferent to the desperate consequences their offending was certain to draw down."

The next campaign, that of 1813, was full of glory; and in describing it our author is eminently happy, though we fancy we meet a trifling contradiction at the outset.

"The appearance (he tells us) of the French army was rather *picturesque than military*. It was crowded in its march, and too fanciful both in the character of its equipment and the variety of its costume. The line and light infantry excepted, few of the regiments were similarly dressed. The horse-artillery wore uniforms of light blue, braided with black lace. The heavy cavalry were arrayed in green coats with brass helmets. The chasseurs and hussars, mounted on slight and active horses, were ably and variously equipped. The *gendarmes à cheval*, a picked body chosen from the cavalry at large, had long blue frocks, with cocked hats and buff belts; while the *élite* of the dragoons, selected for superior size and general appearance, were distinguished by bear-skin caps, and wore a look of martial determination, that their past and future bearing in the battle-field did not belie. Each regiment of the line had its company of grenadiers and voltigeurs; even the light regiments having a company of the former. The appearance of the *whole force* was *soldierly and imposing*; the cavalry was indeed superb; and the artillery, as to guns, caissons, and appointments, most complete; and, better still, their horses were in excellent condition. Both armies were in the highest state of efficiency. To both the undivided attention of their commanding officers had been directed, and yet in their respective equipments a practised eye would detect a marked dissimilarity. With the British every thing was simple, compact, and limited, as far as its being serviceable would admit; while the French were sadly incumbered with useless equipages and accumulated plunder. Those of the Spanish noblesse who

had acknowledged the usurper, now accompanied his retreat. State functionaries, in court-dresses and rich embroidery, were mingled with the troops; calashes carrying wives or mistresses, moved between brigades of guns; while nuns from Castille and ladies from Andalusia, attired *en militaires* and mounted on horseback, deserted castle and convent, to follow the fortunes of some soldier or employée. Excepting that of his great brother when retreating from Moscow, no army since the days of Xerxes was so overloaded with spoil and baggage as that of Joseph Buonaparte. Although this abuse had not escaped the observation of many of the best officers in the army of the usurper, the facility with which these enormous ambulances were transported encouraged rather than repressed the evil. Looking on Spain as a conquered country, the means necessary to forward their convoys were unscrupulously seized, and every horse and mule considered the property of the finder. The roads were good, the retreat unmolested. On the 10th, no enemy had appeared, and the allies were remaining quietly in their quarters. The apathy of the English general was extraordinary; and prisoners were asked by their French escort, 'Was Lord Wellington asleep?' But nothing could exceed the astonishment of Joseph, when, on the evening of the 18th, he was informed that the allies, in considerable force, were actually on the left bank of the Ebro! The French dispositions were rendered useless, and an immediate night-march became unavoidable. The drums beat to arms, the baggage was put in motion, and the entire of the French corps which had occupied Páncorbo, or bivouacked in its vicinity, were hastily collected, and moved rapidly towards Vittoria. Lord Wellington's sudden advance was equally brilliant in conception and execution."

The grand *déroute* of the enemy which ensued, is so well known that we need not offer an extract; nor indeed shall we be tempted, even by the crowning splendour of Waterloo, to go further into the illustration of these volumes, which may truly be received with pleasure and ranked among our literary and national trophies. About half the last volume is devoted to separate "details and anecdotes," connected with the narrative, but affording remarkable images of the extraordinary accidents and adventures which attend modern warfare. These are selections from several popular works, and form a most appropriate and interesting appendix to Mr. Maxwell's own history.

Tod's Rajpootana, &c.

[Second notice.]

AGREEABLY to the intimation in our first review of this work, we proceed to extract the principal points stated in regard to the library of Puttun; such matters being always *germaine*, and interesting to literary readers. Col. Tod says:—

"The Pothi-bindar, or library, the existence of which was totally unknown until my visit to it. It is contained in subterranean apartments in that quarter of the new town which has appropriately received the name of Anhulwarra. Its position screened it from the lynx-eyed scrutiny of Alla, when he destroyed all that was destructible in this ancient abode. The collection is the property of the Khartra sect, of which the celebrated Amra and Hema were the Sripooj, or primates. This sect, called Khartra, or the orthodox (a title conferred by Sid-radji, after long theological disputations), is the most numerous of all the Jain votaries, enumerating at one time no less than eleven

hundred disciples, extending from the Indus to Cape Comorin. Though every one, lay or clerical, bearing the name of Khartra, has a property in the library, it is in strict charge of the Nagar-Seth, and the Panch, or chief magistrate and council of the city, while its immediate superintendence is confided to some Yutia spiritaly descended from Hemacharya, the senior of whom has some pretensions to learning. Years before my visit, I had known of its existence from my own guru, who was equally anxious with myself to place the fact beyond doubt, and on the very day of our arrival, he hastened to 'worship the bindar.' Although his venerable appearance was quite enough to make the padlocks fly open, nothing could be done without the fiat of the Nagar-Seth. The council was convened, before whom my yuti produced his *patravali*, or spiritual pedigree, tracing his descent from Hemacharya himself, which acted like a spell, and he was invited to descend and worship the treasures of ages. The catalogue forms a large volume, and I should fear to hazard my own veracity, or that of my guru, by giving his estimate, from its contents, of the number of books which filled these chambers. They are carefully packed in cases, filled up with the dust of the mugd, or caggarwood, an infallible preservative against insects. The old man returned to me in raptures at what he had seen. But there was a want of correspondence between the catalogue and the contents of the boxes, forty of which he examined in seeking for two works named therein, *i. e.* the *Vanaraj Charitra*, and the *Charitra Salivana*, the leader of the Tak or Tacshac horde, which invaded India from the north, overturning the throne of the supreme monarch, Vicrama, and substituting in the south of India the era called *Saca* for that previously used. The excessive closeness of the subterranean atmosphere compelled him to desist from the search, which he did the more readily, as he was promised permission to copy any work he desired, on his return. Moreover, he had to follow me twelve miles, for the monsoon had already set in; and with very enfeebled health, I had yet a long journey before me. Had time even admitted of my remaining, I had no copyists with me to employ in this new field of research, and I can only hope, therefore, that my discovery may lead the way to others. Extreme caution and delicacy must, however, be observed in the attempt; the use of any thing like power might seal every volume for ever, for the deposit, as before stated, is scrupulously guarded, and only known to the initiated. As they could not have had time to prepare such a receptacle beyond the walls of ancient Puttun, when invaded by Alla, and taking also into consideration the name of Anhulwalla, which this part of the city still bears, we have additional reasons for believing that this portion of the modern city must have been included within the ancient limits. Books may be borrowed from the library by members of the gatcha, who dwell within a certain distance, but they cannot be retained above ten days. Until we have some insight into the contents of the subterranean 'bindar' of Anhulwarra, and a more extended knowledge of the Oswals of Jessulmér, with access to its library, which is equally numerous and probably more select than that of Puttun; above all, until we have formed some acquaintance with the dignitaries of the Jain sect and their learned librarians, we are not in a condition to appreciate the intellectual riches of the Jains, and can only pity the overweening vanity which has prompted

the assertion that the Hindus possess no historical records, and which seeks to quench the spirit of inquiry, by proclaiming such research a vain labour.

"Among the more important objects of future inquiry, would be a copy of the catalogue itself; for though the titles of works, both of the orthodox and heterodox sects, often have little analogy to their contents, this is not the case with respect to the historical tracts, the *Rasas*, *Charitras*, *Stipasas*, *Mahatmas*, &c. I may also repeat, what cannot be too often stated, in order to stimulate exertion, that I obtained many MSS. from Jessulmer, both on paper and palm-leaves, the latter three, five, and eight centuries old, which still silently adorn the shelves of the Royal Asiatic Society's Library. The most ancient of these are works on grammar, and of this perhaps our wise men think they know enough. But would it not be worth while to examine works of this antiquity, if only to convince the curious that nothing new is revealed by them?"

Resuming his journey, Colonel Tod visited Ahmedabad and Kaira, the latter shewing the remains of a once extensive city, where he picked up some curious coins, and observes:—

"But I must repeat what I have often urged, that in numismatics, antiquities in every branch, in the collection of ancient inscriptions or MSS., the English have as yet done next to nothing in exploring ancient India; and when I affirm that, with health and leisure, I could have done ten times more than I have done, and, with increased means, ten times ten, some faith may be placed in my assertion."

Baroda and other places are passed in review as our countryman travels on; his account of the Saurashtra is deserving of particular notice, because of its references to ancient history and nations:—

"Saurashtra forms the most important portion of the kingdom of Anhulwarra, nor is there throughout India any region so well calculated to form a compact principality. It is about one hundred and fifty miles in breadth, from Cape Juggut to the Gulf of Cambay, and the same from the small northern Runn, the receptacle of the waters of the Bunas and Sarasvati, to Deobunder, the ancient capital of the Chauras. It is surrounded by the ocean on every side but the north, where the apices of the two gulfs approximate by means of those vast aranyas (corrupted to runn), or marshy wastes, leaving but a space of sixty or seventy miles open to invasion. It possesses within itself every variety of soil, with numerous streams flowing from the central range (termed Paryati in Hindu geography), towards either coast, these hills affording every description of material for building, and the rivers abounding with fish and their banks with wood. Since the dynasties of Anhulwarra passed away, its various tribes appear to have led a life of nomadic or marauding independence until the Gulcower princes established feudatory claims over some, and absolute power over other portions of the country. The chief subdivisions are Gohilwar, or the district of the Gohills, on the Gulf of Cambay; Jhalawar, to the north, inhabited by the Jhalas; Noa-nuggur, to the west, by the Jains, a branch of the Jharjias; Pore-bunder, by the Ballas; Joonagurh, by a Mahomedan chief; with various other minor districts. In the centre of all are the Cat'hias, while the Portuguese have for three centuries held Deobunder, the old Chauras capital, now converted into Diu. Besides the tribes originating these divisions of the peninsula, many others of an equally Scythic character are to be found, as

the Camari (now the Jaitwa); the Comani, called a branch of the Catti; the Mac-wahana, who claim to be a branch of the Jhalas; the Jits, or Gotes of Jitwar; and several other original, besides the mixed races of Myreas, Cabas, &c. &c., who will be spoken of as we encounter specimens of each. In fine, for diversity of races, exotic and indigenous, there is no region in India to be compared with Saurashtra, where they may be seen of all shades, from the fair and sometimes blue-eyed Catti, erect and independent as when his fathers opposed the Macedonian at Mooltan, to the swarthy Bhil, with keen look, the 'offspring of the forest.' Besides this field for the inquirer into the natural history of man, there is one equally wide for investigating the history of all the religions which have swayed the human mind within this sea-girt corner of Asia. Of the religion of Buddha, it will be seen, as we proceed, that of two points, one must be conceded; either, that it originated here, or that this was the region where it took root on importation from Aria. The discussion of this question involves that of the nearly contemporaneous worship of Crishna, which, if we are to credit tradition, is an offshoot from that of Buddha. The antiquary and the architect would find abundant scope for their researches, and new ideas for their studios, in deciphering the cryptographic documents, and in forming hypotheses on the mechanical genius that planned the multiform shrines which have perpetuated the faith of their founders. And, lastly, the painter might revel amidst harmonious contrasts, and a diversity of beauty, on the mountain top, or on the margin of the ocean, under a cloudless, dazzling sky, or amidst the almost primeval darkness of the monsoon. He might associate the latter with the shrine of Somnath and the dark rites of Siva, while, on the fane of Radha's lover, he would throw 'hues which have words,' and tell of youthful loveliness. Or, as he ascends the mountain to the temple of the worshipper of 'the Spirit,' whatever characterises the grand and the simple, in form as well as in colour, would be present to his mind. This is a feeble picture of the attractions of the land through which I now propose to conduct the reader,—a land containing subjects for many volumes and many portfolios; but my researches, being limited to a rapid tour (though with some previous knowledge of the subject), will oblige me to restrict myself to the most prominent among the many interesting objects of the peninsula of the Sauras."

The Sauras are supposed to be identical with the Syrians. The temple of Somnath, and the shrine of Deva Pastun, the most renowned of India, furnish matter for very curious investigation and description; but we must now take our leave of these and of India together.

MISCELLANEOUS.

A Third Preface to "A Treatise on Wood Engraving, Historical and Practical;" exposing the Fallacies contained in the First, restoring the Passages suppressed in the Second, and containing an Account of Mr. John Jackson's actual Share in the Composition and Illustration of that Work. In a Letter to Stephen Oliver, by W. A. Chatto, author of the first Seven Chapters of the Work, and the writer of the whole as originally printed. Pp. 36. London, 1839.

"MORE first words!" In our notice (in the 116th No. of the *Literary Gazette*) of the "Treatise," we mentioned its having two prefaces; a *duality* which we own struck us at the time as *singular*, and as involving some-

thing "more than met the eye." This *third* preface explains the matter. Mr. Chatto complains, in very warm and unequivocal terms, of having been unjustly treated by Mr. Jackson, and by Mr. C. Knight, the publisher of the "Treatise." He complains of the omission of his name in the title-page of the work; he complains of the suppression of certain passages in the preface to which his name was affixed; he complains of some of the statements in Mr. Jackson's preface; he complains of the assumption by Mr. Jackson of the credit of nearly the whole of the work, both literary and artistic; he asserts that the work was originally projected by himself; he asserts that he was the sole author of the "History of the Art of Wood Engraving," of which history he says Mr. Jackson was entirely ignorant; he asserts that he was merely furnished by Mr. Jackson with a few meagre memoranda, to assist him in his description of the practice of the art; he asserts that of the three hundred and odd cuts in the volume, only sixteen were executed by Mr. Jackson himself; he asserts that he has been most inadequately remunerated for his labour, &c. &c. &c. — "Hard pounding, gentlemen," as the Duke of Wellington said to one of our regiments, under a heavy fire, at the battle of Waterloo.

Peter Parley's Child's First Step; or, Easy Path to Knowledge, &c., by H. Oliver, pp. 120. (London, J. Clements.) — If true that it is the first step that counts, it is true of children's books, and not of St. Denis's ran from Paris. The present is well enough, with nothing particular to call for notice.

Flori Poetici scilicet et Illustrati de Carlo Boicchi, L.L.D. Pp. 483. (London, Rolandi Bosange & Co.; Simpkin & Co.) — The words *terza edizione* shew that this is a very pleasing and popular collection: it is, indeed, a charming volume of "choice Italian" poetry, with brief sketches of the writers, and well deserves its success.

ARTS AND SCIENCES.

ZOOLOGICAL SOCIETY.

A VISIT to the gardens in the Regent's Park, at present, will well repay the lover of Nature. All is activity and improvement. At the last monthly meeting, held a few days ago, it afforded the Council peculiar satisfaction to be enabled to announce to the Society the successful application to the Commissioners of Woods and Forests; who, by a Treasury minute, have agreed to let to the Society, at a lower rent, certain valuable portions of ground in and about the gardens, on a lease, if desired, of thirty years. The works in progress are highly satisfactory. 28,487 persons visited the gardens and museum in July; and 7081, on the month's proceedings was carried to the credit of the Society's accounts. The collection is generally reported to be healthy; and the young giraffe since its death has been prepared with much delicacy and scientific skill: it is now so artistically placed beside its parents, that every eye is deceived by its lifelike attitude.

LITERARY AND LEARNED.

ROYAL SOCIETY OF LITERATURE.

Anglo-Saxon Literature.

MR. WRIGHT's view of the state of the medical profession among the Saxons, brings forward some very curious matters:—

"Surgical operations among the Anglo-Saxons were few and rude. They consisted chiefly in bleeding (the success of which was supposed to depend less on the condition of the patient, than on the choice of the proper time for its performance, according to certain calendars of good and evil days); the application of poultices to draw out humours and reduce inflammations, setting broken bones, and stanching wounds. Honey was the substance

generally used for cleansing external wounds; before application, it was to be warmed at the fire, and mixed with salt. Another operation, described in the Anglo-Saxon medical treatise, gives us no very favourable idea of surgical practice: 'If a man have a limb cut off, be it finger, or foot, or hand, if the marrow be out, take sheep's marrow boiled, lay it to the other marrow, bind it very well at night.' Perhaps the most scientific prescription in the whole volume is a medicated bath, ordered to be used for the cure of a disease which was probably the dropsy; this bath was to consist of a strong decoction of various herbs, among which are enumerated wild marjoram, broom, ivy, mugwort, and henbane; while immersed in it, the patient was to drink a decoction of other herbs, among which we find the all-efficient herb betony, with centaury, agrimony, red-nettles, sage, herb Alexander, &c.; and the liquor in which these latter were to be boiled, was one that we should hardly expect to find mentioned at that time, namely, Welsh ale. The Anglo-Saxon treatise in the Royal Library shews, in a very remarkable manner, that the practice of medicine, amongst our forefathers, as well as among the other branches of the great Teutonic race, was a strange mixture of science and superstition, even in the hands of its most skilful professors. The ingredients which the physician used frequently owed their virtues to some accidental circumstance with which, in the minds of the people, they were connected; as in the case of one receipt in which those particular herbs only are declared to be efficient 'which grow spontaneously, and are not planted by the hand of man.' Much of their efficiency also depended upon the day on which they were administered, or on which the patient fell ill, and this again was regulated by the changes of the moon. The Anglo-Saxon manuscripts contain many lists of the attributes of each day of the lunar month, as they were supposed to be good or evil for sickness and the various operations of life. For example, they inform us that 'the first day of the moon is propitious for all kinds of work; he who falls ill on that day will languish long, and suffer much; the infant who is then born will live. The second is also a prosperous day, good for buying, selling, embarking on ship-board, beginning a journey, sowing, grafting, arranging a garden, ploughing land; theft committed on this day will be soon and easily detected; a person who falls sick will soon recover; the child born will grow fast, but will not live long. . . . The fourth day of the moon is good for beginning works, as building mills and opening drains; the child born on this day will be a great politician. . . . The sixth day of the moon is a favourable day for hunting. . . . The eighth day is good for changing bees; but he who falls sick on this day will suffer a long illness, and will not recover. . . . A child born on the tenth day of the moon will be a great traveller; and, if born on the twenty-first, he will become a bold robber.' These superstitious feelings were not always confined to the manner or time of treating diseases, but they also extended to the diseases themselves. The causes of many outward affections of the body were too apparent to be easily overlooked; but inward diseases often assumed a more mysterious character, which baffled the utmost skill of the physician. They were then believed to be caused immediately by evil beings, the elves, according to the creed of the people, or the demons, according to that of the monks; or else they were produced by the charm of the witch, or by the sinister influence of the evil

eye. Fevers, more particularly, were attributed to such causes; and this class of diseases, which occupies a considerable portion of the second book of the great Anglo-Saxon medical work, introduces us there to a numerous collection of charms and incantations, and to a list of diseases which received their names from the imaginary beings who were supposed to have sent them. In these cases the physician trusted no longer to the simple virtues of his herbs; but he sought to drive away these unwelcome visitors by religious exorcisms; or to pacify them, and induce them to carry their visitations to some other object, by means of counter-charms, which were derived from a still more superstitious age. The latter object was generally effected by charming the disease into a stick, or a piece of wood, which was thrown across a highway, as an effectual separation from the patient, and there it waited to be communicated to the first person who picked up the stick: this process, still familiar to the peasantry in the less enlightened parts of England, was, among the Anglo-Saxons, an approved remedy in the hands of the professors of the healing art. One example from the medical book we have so often quoted, will be sufficient to illustrate the character of the religious charms: it is a 'drink' composed of herbs for a person labouring under a disease caused by evil spirits, and is to be administered in a church-bell:— 'Take thrift grass (?), yarrow, eleuthre, betony, penny-grass, carruc, faine, fennel, church-wort, christmas-wort, lovage; make them into a potion with clear ale, sing seven masses over the plants daily, and add holy water, and drip the draught into every drink that he shall drink afterwards, and sing the psalm *Beati immaculati*, and *Exsurget, et Salvum me fac, Deus*, and then let him drink the draught out of the church-bell, and after he has drunk it, let the mass-priest sing over him *Domine sancte Pater Omnipotens*. The subject of charms is intimately connected with the history of the Anglo-Saxon alphabet. It is well known that what we generally term Anglo-Saxon letters, with the exception of þ, (ð), ð, (dh), and p (w), are nothing more than the common Roman characters, as they were introduced by the missionaries, and used in the early manuscripts. Our ancestors, previous to their conversion, possessed an alphabet peculiar to themselves, the letters of which were in their own language designated by the name of Runes, and which, before their literature was committed to writing, served all the purposes to which they were accustomed to apply them; for these were confined to an occasional inscription, or to certain magical phrases that were engraved on their arms, and on pieces of wood, or other materials, to be carried about their persons. From this practice, and from the rarity of inscriptions, the letters themselves were an object of superstition, and their name became equivalent to magic and mystery. Their form rendered them inconvenient for writing extensively; but long after the conversion of the Anglo-Saxons, the Runic alphabet was preserved; and we find it in manuscripts written as late as the twelfth century. Although these letters were still used for various superstitious purposes, yet they were not unfrequently applied to other objects. As each letter had a significant name, we often find it used playfully in serious poems, instead of the word which designates it, as, for instance, in one of the poems of the Vercelli Manuscript, and even in the Romance of Beowulf. Among the riddles in the Ælster Manuscript, and in the Metrical Salomon and Saturn, these letters

are frequently inserted with the intention of increasing the obscurity of the subject; sometimes with the signification of words, at others merely as letters, while in some cases the two systems seem to be mixed, and we are often obliged to read them backwards, before we can discover the mystery which is concealed under them. The Runic alphabet, and the signification of its letters, form also the subject of a very curious Anglo-Saxon poem printed from a manuscript, now lost, by Hickes in his 'Thesaurus,' and reprinted by William Grimm in a small treatise in German on the Teutonic Runes. Many of the crosses and other strange marks which are found among the superstitious medical receipts, represent probably the Runic charms of an earlier date."

FINE ARTS.

NEW PUBLICATIONS.

Tartar. The Property of Her Majesty. Painted by W. Barraud; Engraved by T. Lupton. Ackermann and Co.

AND no doubt a great favourite of her Majesty's, if we may judge of the beauty of the animal by that of the delineation.

The First of April. Painted by S. E. Jones; Engraved by J. Scott. Ackermann and Co. A PUNCHY old gentleman,

"solicitous to bless,
In all the glaring impotence of dress;"

whose mortified countenance, as he stands with his watch in one hand and a billet-doux in the other, sufficiently indicates the trick that has been played him by a couple of malicious wenches, who, in a snug corner of the background, are enjoying his *disappointment*.

Law. The Cat's Paw. Painted by E. Bristow; Engraved by H. Dawe. Ackermann and Co. To those who know the peculiar humour of Mr. Bristow's pencil, it must be unnecessary to say that this is a very entertaining pair of prints; for they are impersonations of the old and well-known fables:—the first, of a monkey sitting in judgment, and affecting to make an equitable division of stolen cheese between two cats; the second, of another monkey, availing himself of the paw of an unfortunate grimalkin, to extricate some piping hot chestnuts from the fire. Mr. Dawe has given great effect to these whimsical groups.

The Encyclopædia of Ornament. By H. Shaw, F.S.A. No. XIV. Pickering.

THIS attractive publication proceeds with unabated excellence. The present number contains a beautiful specimen of painted glass, from the chapter-house of York Minster, rich velvet hangings of the 16th century, and an elaborately wrought cover of a book of the year 1548.

Military Attack. Painted by S. E. Jones; Engraved by W. O. Geller. Ackermann and Co.

ALTHOUGH we cannot say much for the moral of this little dramatic piece, the hero of which is decidedly of opinion that

"None but the brave deserves the fair,"

we must not withhold our praise of the talent and knowledge of character which it displays. The result of the spirited attack seems scarcely doubtful. The effect of foliage in the background is singularly pleasing and clever.

Woodland Sketches; a Series of Characteristic Portraits of Trees. Drawn from Nature and on Stone, by George Childs. With Letterpress Descriptions, by the Author of "The Sentiment of Flowers," "Woodland Gleanings," &c. &c. Parts I. and II. Tyas.

THESE Sketches are executed with great spirit and beauty, and are highly creditable to Mr. Childs's talents. The publication is to consist of four parts. These under our notice comprehend the Horse-chestnut, the Hawthorn, the Oak, the Beech, the Elm, the Yew, the Holly, the Larch, the Spruce-fir, and the White Willow. The descriptions are very pleasingly written.

Saint Valentine's Day: the Post Mistress. Drawn by H. Richter; Engraved by W. C. Giller. Ackermann and Co.

IF no other advantage should result from the proposed system of post-office envelopes, at least it will prevent the indulgence of the impertinent curiosity which is here so amusingly depicted.

Death of Thomas-à-Becket. Painted by C. H. Weigall; Engraved by G. Zobel. Ackermann and Co.

WHEN this clever composition was exhibited in the gallery of the New Society of Painters in Water-colours, we spoke of it in the terms of praise to which it is entitled. Mr. Zobel has rendered it a most effective print.

Tambourina. Painted by G. Hering; Engraved by C. G. Lewis. Ackermann and Co.

A CHARMING little print. The attitude of the "Child of the South," and the effect of light, remind us of Haydon's characteristic and celebrated picture of Napoleon at St. Helena. But how different must be the train of thought passing through the mind of the gay, innocent being before us, and that which filled with bitter melancholy and remorse the "Hero of a hundred fights!"

ORIGINAL POETRY.

ON TREADING THE ROMAN MOSAICS AT
BIGNOR, SUSSEX.

ROME! thy majestic power we view;
Thy might in war, thy glory too,
Not less in arts of peace;
How great, how elegant, while free;
How low, how vile, when liberty
Fled thy degenerate race.

Yet, as in dawning manhood lost,
That child is fondly prized the most
In deep maternal love,
His virtues to his brothers told,
Oft as their little minds unfold:
Example, fix'd above!

So Nature to thy favour'd clay
Granted exemption from decay,
Thy tongue thy works survive;
Bright as these little stones we tread,
The hues of Roman worth shall spread,
And to all ages live.

C. BARWELL COLES.

THE HEART.

(After the manner of Spenser.)

DID ever sage so wise, with tongue or pen,
Portray the wonders of that wondrous thing
Which lieth in the breast of every man?
Did ever poet rightly of it sing?

The same it is, whether it to a king
Or poorest wight that ever lived belong;
As varied are the fruits it forth doth bring,
As are the forms of count'nance men among:
And sometimes they are right, and sometimes
they are wrong.

Small is it sure, yet it can well contain
Full divers things and idols manifold;
Ofttimes it trembleth much through fear of pain;
Ofttimes it pineth much through love of gold;
Ofttimes desire of knowledge doth it hold;
Ofttimes desire of glory doth it swell;
Most strange it is in women young and old;
Its movements some have thought to buy and
sell:
What wight with mortal tongue can all its
wonders tell?

Deep and unsearchable its nature lies;
So far beyond all ken its myst'ry seems,
As earth below is distant from the skies.
Things vain it hath, as is the stuff of dreams;
Withouten aught of bright and heavenly
beams,
It oft doth seem all-earthly, of the earth:
In some it shines with passion's fiery gleams,
In some 'tis withered up for lack of mirth,
A desert oft it is, where things unclean have
birth.

Nathless it hath affections bright and fair,
Wherewith it lighteth up life's darksome
way—
Hope, that amid all checks indwellet there—
Love, much more cheering than the light of
day—
Devotion, lovelier far than minstrel's lay.
But chiefly 'tis in gentle womankind,
That all its glory shines with blissful ray;
Certes not faultless we the same do find,
More beautiful than night, more fickle than
the wind.

THE SIBYL'S WARNING.

WHEN from one point the breezes blow,
Through summer's heat and winter's snow;
When the bee to the lily alone shall fly,
And pass the rose and the violet by;—
Then, gentle maiden, but not until then,
May Constancy dwell in the hearts of men.

When the spirit's golden dreams by night
Vanish not with the morning's light;
When the sleeping sea forgets to wake,
And its guile and its cunning have left the
snake;—
Then, gentle maiden, but not until then,
Truth may be breathed from the lips of men.

When, from above, the moon's silvery gleam
Fixes itself on the glossy stream;
When iron melts beneath the sun,
When rivers in the desert run;—
Then, gentle maiden, but not until then,
True Love may enter the bosoms of men.

G.

THE TROUBADOUR'S SONG.

OF things beneath, around, above,
To which shall I like woman's love?
The depths of ocean none can sound,
But woman's love is more profound.
Pure lies the snow on yonder hill,
But woman's love is purer still;
'Tis like the rainbow, brightest found,
When darkest grow the clouds around:
To smiles and tears both owe their birth,
And do not both link heaven to earth?

G.

SKETCHES.

MEGPUNNAISM.

[Our recent review of the *Thug* renders the following more interesting: it may be taken as a sequel to that fearful story.]

THIS barbarous term refers to a division of the crime of Thuggee, out of which it grew after the siege of Bhurtpore, in 1826. While the Thugs murder their victims to obtain their wealth, the Megpunnas immolate travellers to obtain their children, whom they afterwards sell into slavery. The great founder of this system, Kheama Jemadar, was considered so holy a man, that, after his arrest, he was entreated by the villagers to extinguish a fire which had broken out in a village; and, by a singular coincidence, the fire ceased as his hands were extended to heaven in supplication. The greater part of the gangs who have engaged in this revolting system of murder, sustain the character of religious mendicants; and the system itself is firmly believed to be under the patronage of the goddess Kalee. In common with the Thugs, they have a slang language, known to all the initiated. Unlike the Thugs, however, they always take their families with them on these murderous expeditions; the females assist in inveigling travellers, and in taking charge of the children till they can be disposed of. Their victims are generally chosen from the more indigent classes, the disappearance of whom is less likely to excite suspicion than that of more wealthy individuals; and they find that it is more lucrative, as well as more safe, to murder the poor for the sake of their children, than the opulent for their wealth. The Brinjaras, who are widely scattered throughout the Upper Provinces, are ever ready to receive the children of the murdered parents; and they enjoy many facilities for subsequently distributing them among the brothels of the principal cities, or disposing of them to men of wealth and consideration. Suspicion may be at once lulled by the declaration, that the children were purchased from indigent parents; who had no longer the means of supporting them. The system is of so recent an origin, that it has not as yet spread further than the Upper Doab, the Delhi territories, and the Rajpootana and Alwar States; and the number of the initiated does not exceed three or four hundred. The conviction of offenders is rendered difficult by the custom they adopt of throwing the bodies of their victim, into the nearest river, and by the distance to which the children are carried, and the obstacles which are found in tracing and identifying them. The report of Major Sleeman on this subject consists of the confessions of some of the principal offenders, and the depositions which were taken in cases brought to light by the exertions of the officers in the Thuggee department. From the confessions, we select some of the replies, which will serve to shew the total extinction of all human feeling which this system induces:—'Gopaul, approver.—I murdered, in company with a large gang of Thugs, eight travellers at Belochepore, and took six of their children, with four other Thugs, to Paloundee; and the rajah, hearing of our arrival, ordered us to be arrested, and we were kept in gaol four months. The Paloundee chief took the children away from us, and sent them to the commissioner of Delhi. After my release from Paloundee, I went on Thuggee; I have never had any other occupation. We formerly used to get Rs. 80 or 100 for fair good-looking children.' 'Jewun, approver.—I murdered four people at Husseecunge, and one of the Bunjarrah Thugs, being dissatisfied

with the division of the plunder, went and related the particulars of the murder to the thanadar, who arrested twenty-two of us. Six children of the murdered people were recovered; one of whom, a boy, named Girdharee, recognised me, and told the magistrate I had murdered his parents with a sword. We escaped punishment on that occasion, owing to some discrepancies in the statement of the boy, who did not witness the murder of his parents; but we attributed our success in getting released, on this occasion, to the goddess Kalee, and we disbursed Rs. 24 in her name, among the Brahmins and poor people." 'Moosoomoot Umree, alias Khumba (a female).—I have been confined in the Delhi gaol about six years, for the murder of three travellers near Delhi. The children of the murdered people were recognised by some of their relatives, who detailed the particulars of the murder of their parents. Three of my sons were concerned in this murder, who were all hung, as well as two others of my relations. I was formerly a Thug Jemadarnee; my husband had a gang of forty or fifty men and women, whom I always accompanied on Thuggee. I never did perform the office of Lugh andoss, or strangler; the female Thugs are only employed in taking charge of the children of the murdered people.' 'Radha, a woman of the Jatnee caste.—My parents were murdered near the village of Dunkaree, in the Boolundshuhur district. There were between forty and fifty Thugs present on this occasion. I did not witness the murder of my parents; they were murdered during the night, and I and my two young brothers were intrusted to the charge of the female Thugs, and we were offered for sale a few days afterwards to some gipsies, who would not give a sufficient sum for me, and I was subsequently adopted by Salga Jemadar, a relation of Khema. I have been in the habit of accompanying my adopted husband on Thuggee since I have been living with him. I have been on three or four expeditions with him. A poor Fakeernee woman was murdered in my house at Joulee, eight or nine months ago; in taking charge of her children during the time my husband was employed in strangling her, I was compelled to obey the orders of my husband, who directed me to prevent the children making a noise. This woman was murdered about 12 o'clock, and her body was covered over with clothes, and removed during the night by my adopted husband, Hurree Sing, and others. Her three children were sold to Khoshallee Bunjarrah for Rs. 20.' The report closes with a list of two hundred and twenty-three Thugs, employed in the system of murdering indigent parents for the sake of their children, who are still at large, together with their age, caste, connexions, and respective districts, and a note appended to it says: 'A gang of forty-four of the above prisoners has been arrested by Lieut. Mills, since this list was prepared.'—*Friend of India*, quoted in the *Asiatic Journal*, last month's Number.

AMERICAN FACETIE.

THE good folks in America, especially in the Back Settlements, though always pushing on right a-head, seem to have more time for facetious paragraphing than their brethren in the old country. From a roll of a Boston journal we copy the following instances:—

"Nine Tailors make a Man."—This sentence, which had its origin in the grateful mind of one who had received his start in life from the charity of the craft, has now, from an ignorance of the circumstance, entirely lost its meaning. The term had its origin in the following man-

ner. In 1742, an orphan beggar-boy applied for alms at a fashionable tailor's shop in London, in which nine journeymen were employed. His interesting appearance opened the hearts of the benevolent tailors, who immediately contributed nine shillings for the relief of the little stranger. With this capital, our little hero purchased fruit, which he retailed at a profit. From this beginning, he rose to great wealth and distinction, and when he set up his carriage, he had painted on the panel, "Nine tailors made me a man."—*Boston Yankee Miscellany*.

Correspondence between a Yankee school-master in Mississippi and his mother in Maine. May 15th, 1838.

Dear son,—Come home. A rolling stone gathers no moss. Your affectionate mother, till death.

July 4th, 1838.

Dear mother,—I wont. Come here. A setting hen never gets fat. Your dutiful and obedient son.—*Ibid*.

"Good morning," said a gentleman to a round, twinkling-eyed son of Erin, whom he met on the road; "your nag is in good order." "Indade, ye may say that; and what 'tis makes her so, it's meself doesn't know, for she has nothing in this blessed world to ate but wheat straw, and that niver was half thrashed!"—*Ibid*.

A Whopper.—We have heard of a man who is so tall that his pantaloons have to be wove in a rope-walk. He folds up like a two-foot rule, and has to get upon his knees to put his hands in his pockets!—*Ibid*.

"Well, Bob, how much did your pig weigh?" "Oh, it didn't weigh as much as I expected, and I always thought it wouldn't."—*Ibid*.

Remarkable Phenomenon.—There is a man in Vermont who sneezes so hard, that every time he commences he pitches a somerset.—*Ibid*.

An old lady in Claremont, New-Hampshire, recently slept so sound, that when she awoke in the morning she didn't know who she was.—*Ibid*.

A Remarkable Fact.—We frequently hear persons boast of the health of their several neighbourhoods, in very extravagant terms; but we think a friend of ours living in Bayou Lafourche can beat all others. He insists that no person was ever sick in his neighbourhood, and very seldom any one dies. He says that when the vicinity where he lives was first settled, the emigrants were generally very young, and lived there so long, without seeing any body die, they did not know what death was. They did not travel much, or they might have been better informed in other places. He says that at last one old man, about one hundred and forty years old, died, and they could not imagine what the deuce was the matter with him, but kept him four days sitting in a chair, when some traveller passing told them the old man was defunct, and then they buried him.—*Ibid*.

The following feather shows how the wind blows about the Boundary Line:—

Maine Battle Song.

Come, sgers! take your muskets up,
And grasp your faithful rifles;
We're gwyn to lick the red-coat men,
Who call us Yankees, "trifles."
Bring out the big gun, made of brass,
Which forges July thunder;
Bring out the flag of Bennington,
And strike the foe with wonder.
We'll lick the red-coats any how,
And drive them from the border;
The loggers are awake—and all
Await the Glm's order!

Britannia shall not rule the Maine,
Nor shall she rule the water;
They've sung that song full long enough,
Much longer than they oughter.
The Aroostook's a right slick stream,
Has nation sights of woodlands;
And hang the fellow that would lose
His footing on such good lands.
And all along the boundary line
There's pasturing for cattle;
But where that line of boundary is,
We must decide by battle.
We do not care about the land,
But they shan't hook it from us;
Our country, right or wrong, we cry—
No budging or compromise.
So—beat the sheepskin—blow the fife,
And march in training order;
Our way is through the wilderness,
And all along the border.—*Ibid*.

Yankee Doodle.—Mr. Watson, in his "Annals of Philadelphia," says that our national air, "Yankee Doodle," was taken from "Lydia Fisher," a famous and well known New England jig. The verses ran thus:—

"Lydia Locket lost her pocket,
Lydia Fisher found it;
Not a bit of money in it,
Only binding round it."

In the "Democratic Review," a long and learned account was given to prove "Yankee Doodle" to be of foreign origin. It probably originated with the Japanese!—*Ibid*.

The Good Old Times.—It is said, that when the town of Gloucester was first settled, a suit of clothes and a pair of boots were provided for the use of the representative; so that in choosing him, they were obliged to select a man of proper size, so that the clothes would fit him. When the wags in Boston saw the representative of Gloucester coming, they would say "Here comes the Gloucester suit of clothes, wonder who is in them?"—*Ibid*.

Song of the Thrush.—One of our poets gives the following spirited version of the song of the thrush:—

"Cheerily O, cheerily O—tweedle, tweedle, tweedle;
Pretty Prudy, pretty Prudy, pretty Prudy;
See, see, see! little Jo, little Joe,
Kissing Judy, kissing Judy, kissing Judy!"—*Ibid*.

THE DRAMA.

The Italian Opera closes to-morrow, after, we should think, a profitable season; Tagliioni being a perfect load-star in the Terpsichorean attraction, and the musical corps as high and delightful as could be desired. The last Number of "The Musical World" has some very strong observations upon the management and the general doings connected with this theatre, which are well worthy of public attention.

English Opera House.—A farce, called *My Cousin the Minister*, was brought out here, and did not survive the night. There being no Bedchamber Ladies belonging to this theatre, the *Minister* was not recalled, and has not reappeared on the scene. Donizetti's opera, the *Love Spell*, has been produced with success. It is well acted, and Balfe, Leffler, Fraser, and Miss Rainforth, sustain the musical department very effectively. Lover's farce, with a change in the part of *Rebecca*, now done in a lively manner by Miss Tyrer, and much compressed, shakes the sides in the pit pretty constantly; and with Wieland in the *Devil's Opera*, gives the half-prices a laughing treat. By the way, this diavolo hurt his ankle one night, and has since played the devil on one leg so cleverly, that no two sticks could match it.

VARIETIES.

Improvement of the River Shannon.—We see with great satisfaction, by the Parliamentary Reports, that a large sum of money is to be applied to the improvement of the

magnificent river. When we descended it, after the Dublin meeting of the British Association, it struck us as one of the most melancholy sights, in a country where there are but too many to cause regret, to see a means so capable of fostering increased industry and national wealth so much neglected. It seemed to us that the Shannon alone might be made to spread utility and comfort over half the extent of Ireland.

British Association.—It is determined to proceed with the meeting at Birmingham, where the grave turn of the Chartist trials has, it is presumed, put an end to any fears of riot or collision.

Scipio Clint, the medallist, we regret to see it stated, has just died, at the premature age of thirty-four. He was a clever artist.

Caricatures.—Four new H. B.'s have just issued. No. 606, "Men of Feeling," Lord Melbourne, John Russell, Normanby, Palmerston, and Duncannon, receiving their quarter's salary from the Chancellor of the Exchequer, and declaring it to be impossible to abandon the sovereign under such circumstances. The attitudes and likenesses are very good. 607, "Symptoms of Insubordination." The Duke of Wellington, as a nursery governess, threatening to leave Lord Melbourne to the naughty boys, and never bring him out again, if he gives way to these towering passions. Lord Melbourne, with his hoop, declaring he will do what he likes, and won't be caught, is a capital boy-figure. 608, "An Irish Subject." Mr Spring Rice driving O'Connell in a jaunting-car, he horse kicking; the Queen, alarmed, calling to be set down; and ministers almost tumbling off. The Irish driver is a great hit in dress and appearance. The last, 609, "The Fall of Achilles." A classical group, the Duke as Achilles; Lord John, as Paris, wounding him in the heel with an arrow inscribed "Exaggeration." The Queen, as Polyxena, is walking away with Lord Melbourne, a priest of the temple of Minerva.

The Planets Rotate about their Shortest Diameters.—The shortest diameter of an oblate spheroid, being its shortest principal axis, is that about which, if any motion of rotation be communicated to it, it will tend to rotate, and into a rotation about which its motion, if left to itself, will ultimately settle (art. 244). We have a striking example of this fact in the system of the universe. The planets are all oblate spheroids, and it is about their least diameters that they all of them rotate. Whether any cause have ever tended to interfere with this rotation, such as the shock of some comet, or whether such a cause ever shall operate, we know not; but this we know, that whatever disturbance may be, for a time, produced, in respect to the axis round which the rotation of any planet takes place, if its form remain unaltered, it will ultimately return to a rotation about its present axis. There are, indeed, various minute natural causes, always in operation, which might long ago have changed the existing axis of the earth's rotation, had it not been that into a rotation about which it tends, from all other axes, to pass. This change would involve a perpetual change in the seasons of every place on the earth's surface. Had its form been that of a prolate, instead of an oblate spheroid, this case of a perpetually changing axis of rotation would have occurred. The least axes of the rotation of such a spheroid, are any of those at right angles to its greatest diameter from its centre; about some of these it would always tend, from all others, to rotate; but it would have

no tendency to rotate about one of them rather than the other; and the slightest disturbance, arising from a change in the condition of the earth's mass, the mere effect, indeed, of the tides of the air and sea, would be sufficient to make its rotation pass from one axis to another—a change which, once commenced, would never again cease.—*Moseley's Illustrations of Science.*

Some samples of sugar, made by Mr. Dickinson, the superintendent of the Joint Stock Sugar Company's works, at Howrah, near Jooneer, are pronounced to be the finest specimens of sugar yet made on this side of India. They are beautifully clean, full-grained, and of fair colour. The sugar would, in the London market, come under the description of fine white, and would bring the highest price given for the same kind of Bengal sugar.—*Asiatic Journal.*

Con.—Why is a thief like a philosopher?—Because he is given to fits of abstraction.

LITERARY NOVELTIES.

We understand that Mr. James is engaged in writing a life of Richard Cœur de Lion, and intends shortly to visit Germany for the purpose of clearing up some doubts in regard to general matters connected with the imprisonment of that monarch. We rejoice to find so national a subject in such excellent hands.

Mr. Leopold J. Bernays, announces a translation of the Second Book of Goethe's "Faust," and other Poems, partly in the metres of the original, and partly in prose.

In the Press.

Oriental Outlines; or a Rambler's Recollections of a Tour in Turkey, Greece, and Tuscany: chiefly intended as a Guide to Travellers, by Mr. William Knight.

CHARLES HENRY ADAMS.

TO CORRESPONDENTS.

The conclusion of our review of Mr. Hallam in our next.

ADVERTISEMENTS.

Connected with Literature and the Arts.

CLOSING OF THE PRESENT EXHIBITION. BRITISH INSTITUTION,

PALL MALL.
The Gallery, with a Selection of Pictures by Ancient Masters of the Italian, Spanish, Flemish, Dutch, and French Schools, is open daily, from Ten in the Morning until Six in the Evening, and will be closed on Saturday, August the 26th.

Admission, 1s. Catalogue, 1s.

WILLIAM BARNARD, Keeper.

THE MODEL of the BATTLE of

WATERLOO is now EXHIBITED at the Egyptian Hall, Piccadilly, by brilliant Artificial Light. Constantly illuminated from Four o'Clock in the Afternoon, and throughout the day in dark or unfavourable weather.

Open from Ten in the Morning until Nine in the Evening.

Admission, One Shilling each.

GALLERY PAINTING,

by TINTORETTO.

For Sale, a splendid Picture by the above Master, well worthy the attention of any Nobleman or Gentleman forming a Gallery. Subject—Samson and Delilah.

For Cards to View, direct to J. B., 200 Strand.

FUTURE AND EXISTING CHILDREN.

FAMILY ENDOWMENT SOCIETY

LIFE ASSURANCE AND ANNUITY OFFICE, No. 12 Chatham Place, Blackfriars, London.

Capital, 2500,000.

Directors.

George Alfred Maitland, Esq., M.P. Chairman.
William Battenworth Bayley, Esq., Deputy Chairman.

Henry Bowden, Esq.

John Fuller, Esq.

Edward Lee, Esq.

Colonel Luard.

Thomas Willis Maitland, Esq.

James Stewart, Esq. M.P.

Major Wilcock, K.L.S.

Advantages offered by this Society.
A married man, paying a yearly premium, or a single sum, varying according to the age of his wife, would secure for each of his future children, however numerous, a specific sum on attaining any given age.

Example.

Wife aged 21. 5l. 15s. 6d. Annual Premium for 25 years; or, 194l. 10s. 6d. paid in one sum, would entitle each Child attaining 21 years of age to 100l.

Persons depending on income may, at a comparatively trifling cost, secure a sum sufficient to give all their Sons a Collegiate or Professional Education, and a Pension to each of their Daughters. Guardians, Trustees, &c., may thus provide for a Apprenticeship Fees without diminishing the capital necessary to establish their Wards in Business.

All persons may on easy terms insure their Lives at this Office.

Examples of Life Assurance for £100.

Age.	30	40	50	60
Annual Premium.	25 4 7	43 9 3	44 4 0	28 5 5

Annuitants of all kinds are also granted by the Society. The usual allowance made to Solicitors, to whom, and all other Persons arranging Marriage Settlements, or other pecuniary transactions, this Society offers peculiar advantages.

JOHN CAZENOVE, Secretary.

CONSTANTINOPLE and its ENVIRONS ILLUSTRATED.

A Series of Forty-eight large and highly finished line Engravings, executed from Drawings on the spot, during a Residence of several Months in 1836, by Thomas Allom, Esq., with an Historical Account of Constantinople, and description of the Places.

By the Rev. ROBERT WALSH, LL.D.

Chaplain to the British Embassy at the Ottoman Porte.

Handsomely bound in Morocco, price 1l. 1s. 6d.

"Mr. Allom had a wide field for the exercise of his abilities, and he has made a most profitable use of it. His drawings being now before us, every thing that is most striking in Turkish architecture and architecture, from the gilded minarets and domes of the imperial city, to the fearful paces and stupendous scenery of the Balkan mountains."—*Art-Union.*

Of the Bengal Civil Service, and Secretary to the Government
of India.

Vol. I. A thick royal 8vo. vol. printed in Calcutta, 17. 10s.
* * * This Work will be completed in 4 vols. Vol. II. is now in
the press.

Wm. H. Allen and Co. 7 Leadenhall Street.

TRAVERSE TABLES, BY CAPTAIN BOILEAU.
In royal 8vo. price 6s. 6d. cloth.

A NEW and COMPLETE SET of TRAVERSE TABLES, showing the Differences of Latitude
and the Departures to every Minute of the Quadrant, and to Five
Places of Decimals; together with a Table of the Lengths of each
Degree of Latitude and corresponding Degree of Longitude, from
the Equator to the Poles; with other Tables, useful to the Surveyor
and Civil Engineer.

By Capt. J. T. BOILEAU,
H. E. I. C. Bengal Engineers.

Wm. H. Allen and Co. 7 Leadenhall Street.

PRODRUMUS; or, an Inquiry into the
First Principles of Reasoning, including an Analysis of
the Human Mind.

By Mr. GRAVES CHAMNEY HAUGHTON,
K.H., M.A., F.R.S., &c. &c., Member of the Institute of
France, &c. &c.

"All men are as the vulgar in what they do not understand."
—Burke.

"It is a work which, if men will take the trouble to think,
must make a powerful sensation. We trust that the attention of
every philosophical inquirer, at home and abroad, will be directed
to its earnest and mature examination."—*Literary Gazette*.

"He exhibits an extent of research and logical accuracy of reasoning,
a depth of thought and a brevity and lucidity of exposition,
which we have seldom seen surpassed. We strongly recommend
"Prodrumus," or the "Procurator," to the attention of our
readers, as decidedly one of the best books for its size that has
come from the press on this subject for very many years."—*Atlas*.

Also, by the same Author, price 2s.

A Short Inquiry into the Nature of Language,
with a view to ascertain the original Meanings of Sanscrit
Prepositions; elucidated by Comparisons with the Greek and Latin.

London: Wm. H. Allen and Co. 7 Leadenhall Street.

THE BOOK of the THOUSAND NIGHTS
and ONE NIGHT, from the Arabic of the Egyptian MS.
as Edited by W. H. MACNAGHTEN, Esq. B.C.S., done into
English

By HENRY TORRENCE, Esq. B.C.S., B.A.

And of the Temple.

Volume I. 8vo. cloth, price 10s. 6d.

This volume, printed in Calcutta, contains Fifty Nights,
amongst which will be found many new Stories, and has the
advantage of containing the whole of the Poetry of the original,
hitherto untranslated.

Wm. H. Allen and Co. 7 Leadenhall Street.

A CHRONOLOGICAL EXPOSITION
of MILITARY LAW, deduced from the different
Writers (Sullivan-Delefos, Adge [Naval], Military Law of England,
and Hough), from the year 1781 to 1839, containing their latest
opinions upon all points, from the Accusation, Trial, to final
Judgment, &c. Exhibiting the prevailing opinions of the majority
in each case; also Rules proposed by the Author, with the
view of obtaining, by competent military and legal authority,
the settlement of the Law-Military, in such a manner as shall
ensure uniformity of practice in the army, and remove all
doubts; so that the duties of officers employed on courts-martial
may be rendered more simple. With Charges on various Military
and non-Military Crimes, in a concise form. Evidence as to
chief points, formulae of a Trial by Courts-Martial, and precedents
in alphabetical order.

By Major W. HOUGH, Bengal Army.
Printed in Calcutta, 8vo. boards, price 8s.

Wm. H. Allen and Co. 7 Leadenhall Street.

Price 8s. 9d.

TRAVELS in the EAST, including a
Journey in the Holy Land.

By ALPHONSE DE LAMARTINE.
A New Translation from the French.

This Work forms one of the series of People's Editions, published
by W. and L. Chambers, and designed to supply approved
works in all departments of Literature, at the lowest price, for
Public Libraries, Mechanics' Institutions, and the houses of the
less affluent classes of the community.

Already issued in the Series.

CABINET OF USEFUL ARTS....

7 — 7

It appears, therefore, that the Series will be completed in 135 Volumes, of which 115 are published, and 20 remain to be published, which will appear in regular succession from the present time, so that the Last Volume will be published on 31st March, 1841.

* Any of the Volumes may be purchased separately. All the Works which are completed may be had, neatly bound in fancy cloth, lettered, with separate and appropriate Title-pages, without any increase of price.

** A detailed Catalogue of the complete Contents of the Cyclopædia may be had of all Booksellers in Town and Country.

The Cyclopædia will comprise, conformably to the original Prospectus, a body of popular Works on History, Biography, Literature, the Sciences, Arts, and Manufactures, comprising Contributions from the most eminent Writers of the Age in the various Departments. Among the Authors are included, in Literature—SCOTT, MACKINTOSH, MOORE, SOUTHEY, SISMONDI, THIRLWALL, MONTGOMERY, JAMES, GLEIG, ROSCOE, NICOLAS, KEIGHTLEY, COOLEY, FORSTER, STEBBING, CROWE, &c. &c. In Science—HERSCHEL, BREWSTER, KATER, LARDNER, POWELL, HENSLOW, PHILLIPS, SWAINSON, DONOVAN, DE MORGAN, &c. &c.

Opinions of the general Work.

"One of the most valuable contributions that has ever been made to the cause of general knowledge and national education."—*Standard*.

"Some of the later volumes rank among the most useful and elegant contributions to modern literature."—*Eclectic Review*.

"A rich library of universal knowledge."—*Monthly Review*.

LONDON: LONGMAN, ORME, AND CO.; AND JOHN TAYLOR.

REVIEW OF NEW BOOKS.

The Vale of Glamorgan: Scenes and Tales among the Welsh. 12mo. pp. 309. London, 1839. Saunders and Otley.

WE are exceedingly pleased with this volume, which seems to us to have a purity about it altogether refreshing. The only ornamenting is in the style, which so much resembles that of Mr. Carne (see his "Letters from the East," and other popular works), that we could almost imagine the writer had formed himself upon his neighbouring Cornish contemporary. He could not have done better, for he is picturesque and ornate without falling into affectation or exaggeration. With reference to the tales themselves, they are simple, and not wrought up to make points, surprises, or striking terminations. Like the original "Arabian Nights," they are not dressed up for the European taste: like good Welsh ale, untouched by the London improvers. Those who read ghost and witch stories for excitement, will not like the book; but those who read for the sake of becoming acquainted with ancient superstitions and traditions, will find them here quite unadulterated. Their general resemblance to the Scottish, Irish, Norse, and German legendary lore, is obvious; but there are some local peculiarities which give them a distinctive character, and recommend them the more to the curious in such matters. And who is not curious? The schoolmaster will be long abroad, the march of intellect indefinitely prolonged, and the system of national education vastly mended indeed, before these things and beliefs, with their firm holds on human nature, are banished from the possession, more or less, of every human mind and heart. But we shall offer no further preface, and proceed at once to the sweet and (once, if not still) fairy-haunted Vale of Glamorgan.

The papers are thirty-one in number, and embrace various legends, intermixed with some well-written descriptions of scenery. The first we shall pitch upon for a specimen is upon *Spectre Haunts*, and the interlocutor who adduces instances of them, thus cites the following:—

"Davy was now getting warm upon his subject, and continued, 'The most remarkable case, however, uncle,' said he, 'of the unrest of spirits, is where hoarders of money, or it is even said, those who have hidden any metal, were it only a piece of old iron, die while it is secreted. Never, here, it is said, do those spirits rest, until the hidden treasure be taken by a living hand, and thrown down the stream of the river Ogmore. Only now lately a tailor's wife at Lantwit, who had been up to that time a stout, hale woman, was haunted and teased by a spirit until she became mere skin and bone, for not choosing to take a hoard honestly to the Ogmore. For a long while the woman, knowing by the spirit's haunts that there was a hoard in the house, had a mind to keep it for her own purposes. The bell-ringers, however, found her in returning from church late in the evening in a sad plight in the church-lane; and she told them, when she came to herself, that having at last consented, for the sake of quiet, to take the hoard to the Ogmore, the spirit had

wafted her through the air so high that she saw the church-loft and all the houses, below her, as though she were in a balloon. In her flurry she threw the treasure up the stream and not down; when, the spirit, with a savage look, tossed her into a whirlwind, and she knew not how in the world she had got back again. Then, again, there is another quite fresh instance of the same thing at Brincethin. A girl was going one fine summer evening for water to a well in a green pasture field, where there was the ruin of an old house. Suddenly something like lightning shot swiftly round her. The girl was frightened, and returned home quickly. The next evening the same thing happened; but the girl now looking aakance along the ground, as the brightness glanced round her, perceived the lower part of an antique female figure, having on high-heeled, peaked shoes, with immense buckles. She ran home in a desperate fright, and soon had all the neighbourhood about her. They persuaded her to go again, and ask the spirit in the Holy Name, what it wanted. This she did, and had to take a hoard from under a hearth-stone in the ruin, to the Ogmore. The spirit had a very old-fashioned look, and was quaintly dressed; but made a most thankful courtesy when the hoard was thrown down the stream. But the most remarkable instance of all,' said Davy, 'is that of the woman at St. Donatts. She had lived in the small cottage where she still continues, on the side of the coom there, with an old curmudgeon of a money-hoarder, and after his death complained to the neighbours that his spirit would allow her no rest. Her appearance indeed shewed there was something the matter; for although she had always been grizzily enough, yet now she became so gaunt and odd, as not only to be a fright to the children, but to make even grown people feel queer when they met her. This was at the time when the folks hereabouts began to be methodistical; so they proposed, as the best thing for the haunted woman's relief, to have a prayer-meeting at her house; and accordingly several serious persons met there one night to pray and sing. They found the woman gruff and strange to their devotions. Presently, however, they filled the cottage, and sang and prayed at a great rate. In the midst of it, the woman cried out, 'There he is!—there he is!' The people stared, but could see nothing. They then desired her to ask, in the Holy Name, what it wanted. She did so; but they could hear no answer. The woman, however, now again asked, 'Where is it?'—and then went to the fireplace, and stretching her arm up the chimney, brought down what seemed to be a bag of money from a secret nook there. She turned round, and crying out, 'Let me go!—let me go!' slipped through them, out of the house, in a twinkling. There were some young men standing by the door, who followed her at full speed directly. It was a fine moonlight night; and they saw her mount before them over the stile, into the road, without touching it, and whisk off, out of sight. No trace of her was then to be seen; and the young men, after staring at each other, returned to the cottage, and now joined the others

with much unction at their devotions. By and by the woman also returned, somewhat tired, and spattered with wet and sand, like one off a swift journey; and said that the old money-hoarder's spirit, after having told her to take, as they saw, the bag of money from the nook where it had been hidden in the chimney, carried her in a trice to the Ogmore river, and held her in mid-air over it, while she flung the bag down the stream. As soon as she had done so, he smiled, took off his hat, with a bow, and then offered her his arm, and escorted her home with civility quite remarkable in the ghost of the morose, old curmudgeon. This,' said Davy, 'as indeed I knew to be the case, 'is vouched for by a great many 'serious' people.'"

The localisation and peculiarity of this superstition, extending to any even insignificant piece of metal, appears to stamp it with great antiquity—with an antiquity when even a bit of iron was as precious to a Welshman as more recently to an Indian savage.

The next passage we quote is, we think, a very touching description, and, in a few words, of the feelings of one long absent from his native home:—

"At length, however, his heart began to yearn after his native land. It was not that he had left behind any friends whom he was now anxious to see again; for his old personal attachments had dwindled away, with time and absence, to mere remembrance. But his great local attachments all the while took root deeper and deeper, until they at length overpowered all other feelings and considerations. He longed with an aching heart and a restless eye to see once more the green fields, and blue hills, and swelling sea of the spot that had given him birth, and where he had been nurtured in his early years; and finding that this longing and aching of the heart could not be repressed, he set out and re-tramped his long and tedious way homewards."

And the result is almost equally affecting:—

"He found on his return that twenty years had been sufficient for many changes in the neighbourhood. And all the changes were to him now displeasing; to miss old objects, and to have new ones obtruded on the eye, equally offended him. He drew hastily nearer and nearer home, and at length spied the smoke curling from the chimney-top of the family cottage. His heart beat quick, and his eye glistened as it hurried from one familiar object to another. But he was among a strange people, although not in a strange land, and sought in vain to recognise some old acquaintance amongst those who gazed at his gaunt and haggard figure. His father's hearth, too, was trodden by those who were unknown to him. His aged acquaintance had been laid low by death, and he could not recognise the features of those whom he had left young."

The *Tolaeth* (ominous and foreboding sounds, the forerunners of death or some sad calamity,) interests us:—

The *Tolaeth* is "a supernatural and ominous imitation of some earthly sound. Thus there is no carpenter throughout all those parts who does not declare, that, before every occasion on which

he is employed to make a coffin, he hears it made by night in his work-shop; which he calls, 'hearing the Tolaeth before the coffin.' It is also a usual thing to hear a feeble plaintive wail pass to the churchyard in the night, before children's death; and nothing is more common, than when a person lies upon his death-bed for supernatural sounds to be heard in the house, such as groans, or a knocking, or the footsteps of the sick person passing out; and all these are called the 'Tolaeth before death.' But the chief sort of Tolaeth is the one before a burying; when all the funeral procession is heard or seen to pass along towards the churchyard; and of one of this sort, the parson gave me the following relation:—

"*The Spectre Funeral.*—"Do you recollect," said he, "a bay horse called Falcon that I once had?—Oh, no, it was before your time. However, he was a fine, high-couraged fellow, as ever was crossed, with no fault but being too rash and violent. At times, to be sure, how he would snort and tear away! And then he would dash at a leap like a very thunderbolt! I thought at times to call him Dreadnought, and then again Death's-door;—he was often so near being the death of me. Ha! how different was I then from what I am now! I used to go hunting then even on that devil; and one day, after a run with the fox-hounds, I had dined at the castle, and was returning home about midnight, a little flushed with wine, on a hand-gallop, now and then humming, or singing, or talking to myself, when of a sudden Falcon bolted off the road into the ditch, and there drooped and trembled, as a very Christian might, for fear. 'Ho, ho!' said I, 'what new quaver is this?' and then I tried to force him on; but that would not do at all. So I coaxed him and patted his neck, and said 'So-ho, poor fellow!' which evidently comforted him; for he moved his tail, and turned his head towards me. But just then a loud band of psalm-singers broke upon my ear. They were pealing forth the old hundredth psalm, which is the one always used at funerals. Nothing could be more distinct or solemn. And presently I heard the slow, regular tramp of the whole procession, with the groans and sobs of the mourners. I knew now it must be a Tolaeth; and, recollecting what I had heard the old people say, I stooped forward on the horse's neck, and, looking along the ground, saw them all advancing towards me. There were the psalm-singers first, two a-breast, with their hats off, and their mouths open, as in the act of singing. Then followed the coffin, borne on the shoulders of four men, who held their hats by the side of their heads. Next came the mourners, the women holding up their handkerchiefs, and the men pale and solemn, with their handkerchiefs streaming behind. And then followed the usual long train of friends and neighbours. All passed, distinct and close, before me, but now, while I saw them, perfectly silent. There was not now the slightest sound of a foot, nor even of the psalm-singers, although their mouths were open. As soon as they had passed, I drew myself up; and then it all broke upon my ear again, as at first. So true it is that the Tolaeth touches only one sense at a time, that, while you hear it, you cannot see it, and, if you see it, you will hear nothing. When it had got quite clear of us, Falcon turned his head towards me, and gave a quiet switch with his tail; then, not without faltering, he made the road, and presently struck off at a round gallop. He dashed through the gate as we reached home, knocking it to shivers, and then stood trembling

with me before the door. Although in top condition, the sweat streamed from him all over, and the poor fellow, as I was going, turned his head so wistfully after me, that I made the man remain in the stable with him all that night. And now," said the parson, in conclusion, "it was not long after this that one of the neighbours was thrown from his horse in returning from market, and broke his neck, just at the place and the hour of the night that I met that Tolaeth; and when he was buried, his funeral passed there exactly in the manner I had seen it." Here I mentioned to the parson an instance of the Tolaeth, which although not witnessed by myself, as the other had been by him, happened in a labourer's family that I knew well, and who were quiet, truthful people as could be. This honest workman and his wife had just turned into bed one night, in the room which was the only apartment of their cottage, below stairs, when they heard the door open, the tread of several persons entering, some of them walking heavily, as under a load, then a moving and drawing of the chairs, and the putting down of some heavy wooden thing upon them. 'Oh, John!' said the wife, 'what is that?' John, rubbing his eyes, jumped out of bed; but they could see nothing. Shortly afterwards their only son went out bathing in the sea, and was drowned. His corpse was brought home upon a ladder, and when carried by a party of the neighbours into the cottage, and the chairs were drawn together, and it was put down upon them, the poor woman cried out, 'Oh! this is exactly what I heard the other night: my heart has been misgiving me ever since.'"

The most particular Welsh point in this superstition, as far as we are aware, is that which restricts the impression of the Tolaeth to only one sense at a time. The second sight of the Highlands not only sees, but (pardon the bull) hears all the circumstances attending the omen at the same moment.

The *Corpse Candle* is common to all countries: the following is a lively account of it, and possesses some slight varieties (such as the yellow spot) to recommend it for extract:—

"The parson of that parish was a snuffy little man, who used to come to the tavern almost every day, dressed in an old suit of rusty black clothes, very coarse yarn stockings, and a greasy hat cocked up behind by his coat-collar. I observed that if he found the ale and fire to his liking, he had no objection to beguile some hours of his time in gossip with the old landlady; and on such occasions he would hold forth to her in a loud nasal twang, very oracularly. One day, however, he turned in with something of a cloud upon his countenance; and as he took out his snuff-box and tapped the lid, at the same time looking round and wriggling his nose, he desired them to bring him a mug of beer, in a voice that shewed he was affected by some more than ordinary incident. Our old landlady regarded him for a moment with a curious look, and then went and drew a mug of her best, and was going to air it for him before the fire, and add to it a little powdered ginger, with the observation that 'the day was raw;' when he seized it out of her hand, and without more ado took off a deep draught. Then, setting the mug down on a bright steel stand upon the hearth, he turned his back to the fire, and spreading his legs, drew a deep sigh. 'Bobba,' said he to the surprised old woman, 'I have just been giving the sacrament to Winny Thomas: the poor girl is just going.' 'Ha!' said our hostess, 'I was thinking as much: *Udgorr angau yro*

pesoch sych, 'the trumpet of death is a dry cough.'" 'Ay,' said the parson, 'and her mother has had the *Marw goel*, 'the yellow spot before some one's death,' on her arm now this long while.' 'It is true enough,' said our landlady; 'the poor woman was in here with me only the other day, for something good to give her *druan*, 'her poor child,' and she told me about it, and how the *Canwyll Corph*, the Corpse-candle, had been in the house.' 'Well,' said the parson, with a drawing, nasal twang, as he tucked up the skirts of his coat, one under each arm, 'I don't know what to say to that. In these days, to be sure, people will have that the *Canwyll Corph* is seen here and there, all about the country; but it was not so, I warrant you, in old times. For the old account is, that this light, which goes from the house to the church before death, was to be seen nowhere but in Wales; nor yet in any part of Wales out of St. David's diocese; nor yet there, it is like, before the time of St. David himself, who, once upon a time, took in hand to pray God that some such token should have its place there as a memorial of him: which accordingly was. And,' said the parson, snuffing a pinch emphatically into his nose, 'it is there, to this day.' But our hostess protested against such a limitation of the *Canwyll Corph* to the diocese of St. David, and declared that she had known many and many people to see it in that very neighbourhood, and immediately entered upon a particular and earnest relation of all the circumstances attending its appearance to Winny Thomas's mother. 'The poor woman and her sick daughter were in bed together one night, when the mother could not sleep for sorrowing over her *anwyll* child, and thinking how lone and disconsolate she should be were she to lose her. And as her eyes filled with tears, it seemed as though she saw confusedly several small lights flitting indistinctly about. So she raised her hand and wiped away the tears, and looked, and at the foot of the bed she saw a corpse-candle sure enough. It was a still, faint, little flame, that shed no light, and every thing remained dark about it. The poor woman gazed at it, like one stupid, for some time; and then, without knowing scarcely what she was about, she raised herself softly, and reached her hand towards it. But as her finger touched the light, it dropped all into pale sparkles that went out as they fell. Just then the sick girl groaned, and something came over the mother, and she could not help sobbing aloud. Her daughter heard her, and asked what was the matter; but she could only answer, 'Oh my *anwyll* child!' She could not go on for weeping. So the sick girl asked again, 'Did you see any thing, mother?'—which startled and surprised her exceedingly, and she replied, 'See? no, my *anwyll*, why?—did you?' 'No,' said the poor girl; 'only I felt as if I saw something.' Here the old hostess raised her apron to her eyes: for indeed they had gradually filled with tears. But as she concluded, and turned off to her housewifery, she told us, with something of an air of triumph, that it was plain enough that the *Canwyll Corph* was to be seen a good distance from St. David's."

But we must come to an end, and cannot do better than take the last sketch in the volume:—

"*Easter Eve.*—On our return, I was surprised, as we came to the churchyard, to find it the scene of extraordinary employment, until I recollected that this was Easter eve. All the village were there, engaged, after the old custom, in trimming and adorning the

graves of their deceased relatives. Some were raising the sides with fresh turf, and putting fresh earth upon the surface; and others whitewashed the stones at the ends; while the women planted rosemary and rue, and the girls brought baskets of spring-flowers, crocuses, daffodils, and primroses, which were placed in somewhat fantastic figures upon all the graves. Among the rest was Gwenllian, Ewythr Jenkins's daughter, who was there dressing the grave of the honest old yeoman. It was the first time I had seen her since her father's death, and now, after wiping her eyes with her apron, she went on to relate all about it. However, she said, that from the first they had scarcely a hope of his recovery, for that indeed they heard his Tolaeth the very night after he caught the cold that carried him to his grave. After describing the manner in which the old yeoman used to go to rest, and how particular he was to fold up his breeches, and place them under his pillow, especially when there happened to be a sixpence in the pocket, she said, that on that night she had taken them from him to sew on a button, and threw them on the round table in the adjoining room. Presently she drew a chair; but as she was going to sit down, there came a loud rap on the table, that startled her quite. 'Oh, Jenny!' said she to the servant girl who was with her, 'what was that?' They looked at one another, but every thing now was as still as could be. So she reached out her hand to take the breeches; but immediately, as she touched them, there came a double rap again on the table, under it, louder by far than the first, and that made all the furniture in the room to ring again. Upon that, a faintness came over her, that she could almost have sunk to the ground; and she thought something then; but as soon as the old man died, Jenny told her that she was sure at the time it could be nothing but his Tolaeth. An old hound that had been lying on the ground with his forelegs stretched out, and his head reclining between them, as he watched Gwenllian dressing the grave, now rose up, and, after winding slowly round me, looked up into my face, and wagged his tail. He had been a great favourite with the old yeoman, who used to extol this ancient Welsh breed, of large size, long rough coat, and prodigious ears and flews. When I remarked the melancholy expression of the old hound's hollow eye, Gwenllian said, one would hardly believe how he pined away after his master. All the time Ewythr Jenkins lay ill in bed, the hound used to walk backward and forward in the house, putting his nose to the empty settle, and then going uneasily to the old man's bedside, where he would stand wagging his tail, and looking wistfully at him. But what was most affecting of all, was to see the 'dumb creature' after his master's death, having been always used to accompany him to church, go off by himself when he heard the bell toll, and, marching slowly up the aisle, lie down in his old place, outside the empty pew."

The foregoing are complete examples of these unpretending tales; and we trust our readers will agree with us in relishing their simplicity and the genuine air of belief with which they are related. "The Maid's Trick," "The Mabsant," "The Cyhiraeth," "Flouting the Ravens," "The Valley of Glooms," "The Coolstrin," are all good; but of those to which

• Upon which merriment two old crones converse, and are thus touched:—

• Two old women, who, knitting as they went, had been taking a stroll, to see how things were going on, sat on a stone bench opposite the house, and now rallied their knitting for a few pinches of 'high-dry.'

we have not specifically referred, "*The Ychain bannog and the Avaine*," is perhaps the strangest, as it seems to indicate certain animals which would rejoice the hearts of Dr. Buckland and M. Agassiz to see and describe.

"I have been (says the story-teller) from one lake to another upon the hills, learning what the old people had to say about the ychain bannog and the avaine; but it amounted to very little, and I could scarcely figure to myself an idea of those terrible animals that in old times desolated whole districts in Wales. Nowhere could I hear any thing, more than that the ychain bannog were said to be enormous horned animals; and that the avaine was thought to be something like a crocodile. All, however, agreed that it inhabited the mountain lakes, and ravaged the country round; and there was scarcely a lake but what was said in the neighbourhood to be the one out of which the ychain bannog drew the avaine. How the old people's eyes glowed with the thoughts of past times, as they talked darkly about these matters! But now I saw it all," he continued; 'the avaine drawing himself up, and putting one foot out before the other, and listening for his prey. But he had made the country still and desolate far around. There was no sound there but the rushing of the Bala water. For long tedious days did he watch with a blood-thirsty ear and a devouring eye from the still surface of the lake on the mountain-top. And at length there was a heavy tread in the distance. The avaine reared himself, and looked round with a ravenous eye. The heavy sound of that trampling drew nearer and nearer, and at length the ychain bannog came in sight. What grim disappointment and affright seized his hideous countenance then! He plunged into the lake, and at his splash the mountain abook. The ychain bannog heard it, and raised their nostrils to the wind. Slowly, but forcibly, they lash their sides with their enormous tails. They toss their heads and roar, till the mountains echo. Then with a rolling gallop they reach the top, and stand gazing into the lake. Deep and long was the dive of the avaine, but at last he comes up for air. Better, monster! would it be, to perish in the still deep caverns of the lake!'"

Were these the Saurians, Iguanadons, or Megalotheria, of ancient Wales? Perhaps so! Who can tell?

Polynesia; or, Missionary Toils and Triumphs in the South Seas. A Poem. 12mo. pp. 116. London, 1839. Snow.

THIS beautiful and unassuming little poem carries with it a strong recommendation, for, besides the originality of the subject, it seems to have been written for a great and good purpose; namely, to recommend that noblest of all enterprises—the regeneration of Pagan nations, by the diffusion of Christian principles. Any writer setting out with so pure an intention as this, would at least enlist the best feelings of his readers, if he had not the power to arouse their sympathies. But when, as in the present instance, the work bears the true impress of poetry, and shews in almost every page the touchings of a true spirit, something more than our sympathies are roused; we feel the soul kindle under the subject, and involuntarily exclaim to ourselves, "Can it be that we are living in a world where such things as these

The old snuff-taking dames listened with much complacency, shaking their aged heads, in unison with the tune. "Ay, ay," Ally Howell," said one of them, "you and I may never hear the like again." "No," replied the other crones, "when the worm and the clay are in our ears, Will Howe's harp will sound in vain."

are still going on?" Yet so it is; and in a country that seems almost to rival all that poets have written of the garden of Eden, and the sweet valleys of Arcadia; there, until lately, reigned the deep midnight of ignorance, superstition, and blind barbarity. Not that all is now black and overcast, as it was a few years ago, when even the eye of hope gazed forlornly over the desolating darkness, and sighed heavily while watching for the first faint streak of dawn to illumine that land of beauty and wretchedness. No; the light has at last broken upon it, and revealing a goodly prospect, the sun now gilds a rich harvest-field, that seems to call aloud for labourers to gather the fruit into the garner. The good seed has been sown, taken deep root, and flourished; yet the crop is still standing until the reapers are ready to bring in those treasures, which the now enfeebled hands of the husbandmen can no longer manage alone.

But turning to the poem, which is rich in descriptive passages and powerful painting, let us look at the state of the aged savage, as he was before the sound of the Gospel broke upon the land, when his own son too often dealt the death-blow:—

"But grant he lives—grant that his pilgrimage Has reached the verge of patriarchal age: Even then, unblest by kindred sympathy, He sits forlorn beneath yon blasted tree! For him field, forest, flood, have lost their charm— Hope quits his heart, and strength deserts his arm."

Yet haply he has children—daughters—sons, Within whose youthful veins his life-blood runs? Haply they soothe him, bear his load of care; Prep his frail step, and humour his gray hairs; No! filial love has never touched their soul— They never felt Religion's sweet control! How should they save whom they have scorned to soothe?

'Shall age,' they cry, 'usurp the place of youth? Shall he be fed, who, borne on tottering limb, Can fight no more—nor hunt, nor fish, nor swim?'

No! none shall pity—none for him shall plead: None climb the bread-fruit-tree that he may feed! None spread the mat beneath him—none supply The food which his own flesh and blood deny! No! like a leathern leper, thrust aside— He dies—as helpless age too oft has died: Consumed by famine, or condemned to feel The ruthless partridge's unallotted steel! Or, stealthily, beside the midnight wave, Led forth and buried in a living grave!"

The annexed passages (which we must introduce by the following note) have struck us, as containing some fine traits of savage life. We regret that our space will not allow us to give the whole of this beautiful episode. But first the note, that our readers may better understand the subject:—

"On the eve of war, also, human victims were invariably offered:—'King Pomare being about to fight a battle which would confirm him in, or deprive him of, his dominions; to propitiate the gods, by the most valuable offerings he could command, was, with him, an object of the highest concern. For this purpose, rolls of native cloth, pigs, fish, and immense quantities of other food, were presented at the Maraes; but still a tabu, or sacrifice, was demanded. Pomare, therefore, sent two of his messengers to the house of the victim whom he had marked for the occasion. On reaching the place, they inquired of the wife where her husband was. She replied, that he was in such a place, planting bananas. 'Well,' they continued, 'we are thirsty, give us some cocoa-nut water.' She told them that she had no nuts in the house, but that they were at liberty to climb the trees, and take as many as they desired. They then requested her to lend them the O, which is a piece of iron-wood, about four feet long, and an inch and a half in diameter, with which the natives open the cocoa-nut. She cheerfully complied with their wishes, little imagining that

she was giving them the instrument which, in a few moments, was to inflict a fatal blow upon the head of her husband. Upon receiving the O, the men left the house, and went in search of their victim; and the woman, having become rather suspicious, followed them shortly after, and reached the place just in time to see the blow inflicted and her husband fall. She rushed forward to give vent to her agonised feelings, and take a last embrace; but she was immediately seized, and bound hand and foot, while the body of her murdered husband was placed in a long basket made of cocoa-nut leaves, and borne from her sight. It appears that they were always exceedingly careful to prevent the wife, or daughter, or any female relative, from touching the corpse; for so polluting were females considered, that a victim would have been desecrated by a woman's touch or breath to such a degree, as to have rendered it unfit for an offering to the gods. While the men were carrying their victim to the Marae, he recovered from the stunning effect of the blow, and, bound as he was in the cocoa-nut leaf basket, he said to his murderers, 'Friends, I know what you intend to do with me; you are about to kill me, and offer me as a tabu to your savage gods; and I also know that it is useless for me to beg for mercy, for you will not spare my life. You may kill my body, but you cannot hurt my soul; for I have begun to pray to Jesus, the knowledge of whom the missionaries have brought to our island.' Instead of being moved to compassion by his affecting address, they laid him down upon the ground, placed a stone under his head, and with another beat it to pieces. In this state they carried him to their 'savage gods.'—One of the assassins, whose business it was to procure human sacrifices, sailed with me in my last voyage, and not only confirmed the foregoing statement, but detailed many other transactions equally tragical in which he had been engaged."

"First of the few who heard and loved the Word
Was one—the daughter of a pagan lord—
One who had cast her wooden gods away,
To learn of Him to whom the Christians pray.
But still her lover to his idol clung,
And mocked the wisdom of a woman's tongue—
Deaf to her creed, and hardened in his own,
Still bent the knee at Oro's idol throne.
And fair was Nera; rich in native grace;
Her step elastic, sunshine in her face;
Her features finely, delicately, wrought—
Lighted with smiles, and eloquent with thought:
The rose just struggling through her cheek's dark tint,
That shades, yet lightens, every lineament.
And then her eyes—deep, dreamy, subdued by love;
Her glance—the mingled falcon and the dove;
And lips that lent their freshness to the dawn;
And limbs that mock'd the fleetness of the fawn;
And voice as soft as when young seraphs raise
The songs of mercy to their Maker's praise—
Alas, that such should ever wake the strain
That leads the dance at Oro's bloody fane!
Her heathen sires, through immemorial years,
Had girt Tahiti with unconquer'd spears;
Till worn at last, with long successful wars,
They found some nameless heaven among the stars.
Beneath the shadow of yon tall bamboo,
That up to heaven its mastlike stature threw,
A wicker cabin, thatch'd with plaited leaf,
Overlook'd, with latticed door, the coral reef;
Thick round its threshold gaudy creepers hung
Their scented leaves, and cluster'd garlands hung;
While birds of golden plume, beneath their shade,
With many a song the sheltering leaves repaid.
And nightly here, beneath the bread-tree's boughs,
The pagan warrior met his gentle spouse—
Comed the wild legends gather'd from her lips,
Of Oro's wars, or England's wondrous ships!"

The priest demands a victim, and sends out his messengers to capture Nera's heathen lover. She hears them whisper his name in the thicket, warns him to escape, and—

"'Away!'—With flying steps they scale the steep—
Plunge in the stream—or, like the chamois, leap
From rock to rock; and through the dark ravine,
Deep rocky labyrinth, and forests green,
And battle-fields with bleaching bones defaced,
They hasten on;—but ever, in their haste,

They seem to hear pursuing feet behind,
And words of baffled vengeance in the wind!
'Away—away! those blood-hounds in the rear—
Nothing is left to hope, and all to fear!'

At length, beneath yon green declivity
That dips its sylvan crescent in the sea,
They halt—they cast their anxious looks around—
Then, stooping low—with ear close to the ground,
They listen! but no sound of omen'd death
Alarms the ear; the slumbering forest's breath
Sleeps with the stillness of an infant's sigh.
So soft the scene—so calm the starry sky—
So sweet the spot—from man so far remote—
It seems the paradise of peaceful thought!
Where not a sound escapes the leafy boughs
But seems the echo to their whispered vows."

The lovers escape and live together like Juan and Haidée in a cave, but Nera employs herself differently to what the island daughter did, and teaches her companion the truths of Christianity; she is a Crusoe to her man Friday, and he becomes a true believer.

She watched him sometimes when

"He slept: but she, the sentinel of love,
Was sleepless as the stars that watch'd above;
For, though her words were full of hope, her breast
Was chilled with fears,—with boding woes oppress'd!
And watchful at her warrior's side she sat
Where Nature's hand had spread her flowery mat—
Each sense upon the stretch—her ear and eye,
Now bent on him, now upward to the sky,
Mark'd every changing shadow, sound, and hue,
Caught every breath that on the night-wind flew,
'That stir'd the mirror of the forest lake,
Or crept in whispers through the listening brake."

But we cannot leave the lovers without giving another extract:—

"When days had flown, and Raiata's isle
Bask'd in her tropic summer's ardent smile—
When verdure, fruits, and flowers, and sparkling rills,
Made glad her winding valleys and wooded hills—
Oft in the moonlight, near yon coral cave,
That spreads its sparry chambers 'neath the wave,
And glittering with stalactites, or, in gloom—
Combines at once, a fairy bow and tomb—
Dim forms were seen, that, o'er the sands below,
Like silent shadows fitted to and fro.
'T was there, when savage hunters hedg'd them round,
The stricken deer a safe retreat had found.
There, many a lonely hour, and lingering week,
Had left their cares on Nera's wasted cheek.
Yet there were sparkling fountains, and ripened fruit;
And, safe from hunter's snare and friend's pursuit,
With looks so bright, to lighten sorrow's hour,
That sparry cave was changed to lover's bower!
For love is like the sun, whose genial ray
Can change the darkest solitude to day!"

But now, the isle at rest—the god appear'd—
And Nera's soul from sleepless fears releas'd—
Once more, emerging from their coral cell,
'T was sweet to roam the flower-embellish'd dell;
And 'neath its fringe of verdure, side by side,
To find that refuge which the world denied—
To watch the wave—or spangled heaven, whose stars
Wheeled brightly o'er them in their glittering cars;
While to the air the blossom lent their balm;
And, save Maké's spirit, all was calm."

We have selected such specimens as we considered best adapted to our columns, leaving untouched those interesting passages which describe the labours and privations of the missionaries, and all they underwent on first landing on these delightful islands. These are matters which we must leave for the perusal of those who purchase the book, and we doubt not but that the number will be considerable. We must not, however, omit to mention that many interesting notes are affixed to the work, and such as cannot fail to arrest the reader's attention; and, in conclusion, we sincerely trust that this meritorious little poem will meet with that success which it deserves, both for the intent and the superior manner in which the subject is treated.

Memoirs of the Life and Labours of Robert Morrison, D.D., F.R.S., &c. Compiled by his Widow; with Critical Notices of his Chinese Works, by Samuel Kidd, and an Appendix containing Original Documents. 2 vols. 8vo. London, 1839. Longman and Co.

We have never met with a work more impracticable for review than these memoirs of a

very excellent and most zealous individual, whose philosophical pursuits and missionary services, during a long and useful life, have made him so well known throughout the civilised world. Within such bounds as we could allude to the task we could not do justice even to any fair and separable division of his labours, either as the Chinese scholar or the teacher of the Gospel. We have in despair taken up the volumes and laid them down again; read fifty pages here and fifty there, and have tried to reduce the matter to order or analysis, till at length the hopelessness of the attempt has compelled us to abandon it, and refer to these massive records themselves for those things which have an interest for the literary and religious world.

The dates and particulars of the reverend doctor's career are also too familiar to the public to require repetition; and, on a view of the whole, we must be content to acquit ourselves of our duty in the very imperfect manner which the subjoined selections complete.

In 1814, we find him established in his important sphere at Canton, writing as follows:—

"There has been a very serious rebellion in this country, and which is not yet suppressed. It is confined to the northern provinces. The throne of the present emperor appears very insecure. O that, whilst the judgments of God are abroad in the earth, men would learn righteousness. The famine in the province of Shan-tung was so severe that human flesh was publicly sold and eaten by the starving people."

"Feb. 24.—A paper published by authority appoints the days on which the spring sacrifices are to be offered. The persons are Kwan-ia, a deified warrior; Confucius; the gods of the grain, of the hills, and rivers; the god of the district Nan-hae; the god of the sea; the god of the wind; the god of fire; the queen of heaven; the inventors of agriculture, &c."

"28th.—The rebels yet cause much uneasiness. A person has addressed his majesty, requesting that all the lighter productions of the Chinese of the novel kind might be suppressed. The Chinese call that class of books *seau shwō*, 'small talk.' They often tell tales of oppression and opposition to the government, and hence were supposed injurious. They are also frequently of a loose and immoral tendency. Rigorously correct parents sometimes entirely disallow the *seau shwō* to their children."

"*Low-ma-yay*, an old gentleman of great influence in the place, asked me the other day respecting our religious sentiments and practices. I briefly stated the sum of the Christian religion. He said the system was grand, and that he taught them in his own family to lay less stress on burning of incense, but more on the regulation of their conduct. The gentleman just mentioned told me that he spent three days in reading the volumes of the New Testament which I gave him; and that he perceived their tendency to reform the heart. He is smiling at a kind of quietism; to have the heart unmoved by ambition, anger, desire, or any other passion; and that he should feel a perfect acquiescence in the allotments of Heaven:—when Heaven frowns, as in the evil sometimes dispensed, to be submissive; when it smiles, as in the opening flower, or shining sun, to feel pleasure. He was once rich, and in honour, but is now poor."

These diaries are but meagre, and much of them occupied in recording the writer's everyday proceedings and religious instructions. In 1816, he accompanied Lord Amherst's embassy as interpreter; but the particulars of that mission are all already published.

In 1828, we copy again from the brief diary. "I met this morning with this little Chinese story:—Hoo-shaou was a very poor man, yet he daily thanked Heaven for pure bliss. His wife said to him: 'We have daily only three meals of greens, rice, and water. What do you call pure bliss?' He replied: 'Happily we live in times of peace, and experience none of the miseries arising from conflicting armies; happily there is nobody in our family suffers from hunger and cold; and happily none of us are laid on a bed of sickness, nor immured in a prison; if this be not pure bliss, I know not what is.' Though this is a pagan story, I think it, as you will, a very edifying one; we have to thank Heaven for all that Hoo-shaou had, and a great deal more."

"I have just received the daily paper. There is to be a review of the troops to-morrow, by the governor and deputy-governor. On Monday, the Hon. Mr. Kin is to be married to Miss Tang, &c., &c.; and on the second of next month, Mr. Wán is to be espoused to Miss Sin, &c. I don't ever remember to have seen such things noticed before. The parties are all the sons and daughters of mandarins."

"On the importance of female education, they say, Kwei mun wei fung hwa che yuen, 'The ladies' apartment is reformation's source;' i. e. a good or bad female education corrupts or reforms the manners of a country."

With respect to the servants, I am at a loss what to say; it is a great trial of patience. The pagans of this country are proud and unprincipled, and hence it is, that we are come among them to try to do them good. To get well-principled and strictly faithful servants, who will not try to overreach and make money, is not practicable; therefore the general sentiment for us to adopt is to expect little, and bear much. Benevolence has brought us here to do them good, and we must do the best we can. Kidnapping is much practised in China, often with the design of getting the reward for the lost child; and on one occasion, the child of European parents was enticed away from Macao. Ahng says, that the more cultivated servant-woman will not go into the service of foreigners: you now see, my love, what must have been my troubles, when unassisted, disheartened, and without money, I had to find my way to the Chinese, and associate with them as I have done, to learn from them what I have learnt, in order to teach them what is of more value than all the money that was ever made in China."

The correspondence relates to the missionary proceedings, and often to Chinese affairs in general; on which Dr. Morrison advised with many of our highest authorities in India, as well as with religious societies at home, their members, and his own relations. In all an eminent spirit of piety and love for his fellow-creatures are conspicuous.

At a time when the state of our countrymen at Canton is in jeopardy, the following, from "Thoughts on the Conduct of the Chinese Government towards the Company's Servants," will be read with interest:—

"They do not acknowledge that which is the fact, viz. that the trade is a reciprocal exchange of benefits; that they open a market to sell their commodities. No; for then there would be an equality in carrying on the trade, there would be reciprocal rights betwixt the buyer and seller. If they were not much obliged to the buyer, yet, at the lowest rate, the buyer would have a right to civil treatment both from the merchant and the government, and also to be fully heard in his own cause.

They are aware of these reasonable inferences, and from policy, not from vanity alone, they perch themselves on the summit of a lofty pre-eminence, and from the celestial empire promulgate the idea, that 'they are perfectly indifferent to the commerce; that they would rather not have it; that from motives of compassion and benevolence alone, they permit the trade; they are benefactors, and therefore foreign merchants, the recipients of their bounty, have no rights; there are no reciprocal obligations, it is all compassion and benevolence on the one hand, and there should be nothing but gratitude and submission on the other.' This artful mode of proceeding runs through the whole of the government. They assume a false principle in reasoning, or untruth in fact, and then flourish away in argument to the astonishment and complete discomfiture of all their opponents. They often make a specious appeal to the reason and common sense of those they address. Having acquired the art of false reasoning, that is, reasoning from false principles or false facts, and possessing the power in their own hands, they always prevail. The applicant for justice is struck dumb. The people say proverbially, 'The mandarins have the largest mouths.' They carry on real tyranny and oppression under the semblance of justice and equity; and hence, persons in England, not finding all sense and reason outraged in Chinese documents, judge erroneously of the slow, grinding, galling oppression of the Chinese government. It were endless to state all the particular acts of injustice and ill-usage to which Englishmen are subject in China. The contemptuous manner in which their persons, their employers, their country, and their king, are treated in official documents, is not easily borne, at the same time that it is not an evil easily tangible by persons who in England are so widely removed from its immediate contact. To be styled, to their face, barbarians, demons, official staters of untruth; to hear his majesty's officers and ships stigmatised with the name of plunderers, must all be submitted to. In writing official documents to the Chinese, they are not allowed to call their employers honourable, nor the king of England an independent sovereign. The native domestics of the Company's servants are fined and punished for the simple act of serving them; the Honourable Company's trade is interrupted, and a fleet delayed on the most frivolous pretences, perhaps a fee unpaid by some native merchant, with which the English have not the slightest connexion. These are some of the constant, regular, daily evils.

"There are from two to three thousand Englishmen, or persons subject to the English flag, who annually visit China, and remain there six or seven months. So large a number of persons having occasional intercourse with some of the worst of the Chinese community, collected in the suburbs of a great sea-port town, it is impracticable to prevent totally the commission of crimes. That there will be occasionally acts of fraud, and violence, and murder, is to be expected. The Chinese do not give the protection of their laws to foreigners. Almost annually, Englishmen lose their lives, or are robbed, without commonly any investigation being made; or, if made, universally without success. The government rigorously requires life for life, when any of their own people are killed, and this with so little regard to justice, that they practically care not whether he be an innocent man or the murderer whose life they take; hence the great difficulty of resigning an Englishman to their power. But Englishmen sometimes commit

acts of violence for which they deserve an equitable punishment. However, to give them to the Chinese government, is not to give them up to justice, but to certain death, whether guilty or not. To prevent the lives of Englishmen being taken unjustly, offenders are screened when in China, and when brought to England, they are not punishable for crimes committed under another government. A murder committed by an English subject on an English subject, is not noticed by the Chinese government, and is not punishable in India or England. Thus several thousand persons are left for a considerable length of time without the benefit of any law. Petty frauds are sometimes practised on Chinese shopmen, to redress which, they have no other means than waylaying and cudgelling the offender, in which case they themselves sometimes suffer. Since the Chinese government is so remiss as not to give the protection of its laws, and so unjust that it is certain ruin to be amenable to them, would it not be advisable to appoint a judge-advocate to hear all causes, and punish or protect Englishmen, as well as to be the medium of intercourse in all affairs, not purely commercial; or even in these, if the chief shall see proper to request his interference? It is probable the Chinese would not object to this mode; for it is their practice to give back foreign offenders to the neighbouring states to be punished, and to require their own people to be given back to them. If there be insuperable objection to the appointment of a judge-advocate, let the powers of a magistrate be vested with the chief. These powers for the punishment of crimes are what give a person high respectability in the sight of the Chinese, and without these, the lowest district officer in China considers himself superior to the chief agent of the English commerce. The great evil of this fancied superiority is felt at all times, but most so when any negotiation takes place."—Appendix.

The Parent's Friend, by Dr. Morrison (pp. 148, Fisher, Son, and Co.), has also just appeared, and a better "manual of domestic instruction and discipline" can hardly be put into the hands of Christian families.

A History of British Birds, Indigenous and Migratory: including their Organisation, Habits, and Relations; Remarks on Classification and Nomenclature; an Account of the Principal Organs of Birds, and Observations relative to Practical Ornithology. Illustrated by numerous Engravings. By William Macgillivray, A.M., F.R.S.E., &c. Vol. II. Cantatores, Songsters. 8vo. London, 1839. Scott, Webster, and Geary.

WE have much pleasure in hailing the appearance of a second volume of Macgillivray's book on British Birds. Macgillivray we say—we do not Maister him, for "his foot is on his native heath," and his style so friendly and familiar, so eloquent withal, that it wins upon us, and while we peruse the work we are at home with the author. We have already expressed our opinion of this great ornithologist's labours in our review of his first volume. We must now only say that their continuation has equal interest and equal merit. In his preface to this volume, he perfectly describes his own manner of writing:—

"In the present work, as in others, and in all my papers published in various journals, I have endeavoured to adapt the style to the subject, rendering it compact and precise when engaged with technical descriptions, copious and florid when treating of the actions and haunts of birds, abrupt or continuous, direct or discar-

sive, harsh or harmonious, according to the varying circumstances of the case. My aim has been to amuse as well as to instruct, to engage the affections as well as to enlighten the understanding, to induce the traveller on the road to science to make occasional excursions tending to raise his spirits, and to shew to the public that ornithology is not necessarily so repulsive as some of its votaries represent it."

From the beautiful descriptions that crowd the book, we extract the following touching episode of the dying struggles of a wounded bird:—

"The most melancholy ornithological exhibition that I remember to have witnessed, was that of a wounded dipper, which was shot through the lungs, above Cramond Bridge, near Edinburgh. It stood still, without attempting to fly off, apparently insensible to all external objects, its legs bent, its wings drooping, its head declined. The blood was oozing from its side and gurgling in its windpipe, which the poor bird made ineffectual efforts to clear. At intervals a convulsive heaving of the chest took place, followed by an effort to vomit; and in this state the sufferer stood for five minutes until I got over the stream to it, when it expired in my hand. In the agony of death, the pupil became contracted to a mere point, and presently after dilated, when the lower eyelid gradually rose and covered the eye. This is commonly the case in birds, which do not expire with the eyes open like man, and most quadrupeds."

The sky-lark's song Macgillivray describes with a poet's hand:—

"The song of the lark is certainly not musical, for its notes are not finely modulated, nor its tones mellow; but it is cheerful and cheering in the highest degree, and protracted beyond all comparison. In a sunny day in April or May, when the grass fields have begun to resume their verdure, it is pleasant to listen to the merry songster that makes the welkin ring with its sprightly notes; in the sultry month of July, still more pleasant is it to hear its matin hymn while the dew is yet on the corn; and in winter should you chance to hear the well-known voice on high, it reminds you of the bright days that have gone, and fills you with anticipation of those that are to come. No doubt much of the pleasure derived from the lark's song depends upon association, and to him who finds delight in wandering over the green fields, along the daisied margin of the clear stream that winds in the bottom of the pastoral glen, or upon the ferny brae, where the 'lang yellow broom,' and 'blossomed furze unprofitably gay,' shoot up amidst the wild thyme, yarrow, and blue-bell, it is pleasant to listen even to the 'skirl' of the corn bunting, the see-saw song of the tit, the creaking cry of the partridge, or the singular croke of the landrail; but, independently of circumstances and associations, the song of the lark imparts an elasticity to the mind, elevates the spirits, and suspends for a time the gnawing of corroding care. The mellow song of the merle or mavis is apt to inspire melancholy, especially if heard in a sequestered valley toward the close of day, and the feelings which it excites have perhaps as much of a depressing as of a soothing tendency; but the carol of the lark, like the lively life, excites pure cheerfulness, and might with propriety be prescribed as an antidote to dulness. It is not merely music that we look for in the song of birds, but variety, and the expression of passions, feelings, and wants. Were all our warblers to tune their throats according to rule, we should become sickly and sentimental, fill the valleys with

sighs, and groan from the mountain-tops; but the loud war-whoop of the eagle, the harsh scream of the heron, and the croak of the raven, are antidotes to the bewitching melody of the black-cap and nightingale. I have endeavoured to trace a repetition at regular intervals in the strains of the lark; but its modulations seem to have no rule. In confinement this bird sings every whit as well as when at large; and when rapidly perambulating the square bit of faded turf in its cage, it enacts its part with apparently as much delight as when mounting 'towards heaven's gate.'"

Success, then, attend thy researches and thy wanderings, thou gentle ornithologist; thou art, indeed, the star of natural history in the north, a light amid the mists of Cairngorm, the haunt of the ptarmigan and raven.

Outlines of Analogical Philosophy; being a Primary View of the Principles, Relations, and Purposes, of Nature, Science, and Art. By George Field, author of an "Essay on the Analogy and Harmony of Colours." 2 vols. 8vo. London, 1839. Tilt.

THERE is no system of philosophy more seductive, and none more uncertain and likely to lead one astray, than that which is founded on Analogies. Many a wild-goose chase have we had in that way; and yet, though we confess that our conclusions were not always borne out, we are free to assert that we reaped much both of pleasure and instruction from the attempts.

The original sketch or skeleton, and detached parts of these volumes, appeared, some twenty years ago, in the "Pamphleteer;" and Mr. Field has now consolidated them, in the belief that they contain "the seed of a complete reconciliation throughout philosophy." Whether they do or not, we fear it cannot be for us, in a sheet like the *Literary Gazette*, to determine; for the questions are too numerous and great, their relations too extended, and their illustration too difficult to be even touched upon, in any detail, in a journal so limited as ours. We shall, however, quote one or two brief passages to shew that the author's remarks are often judicious, though we meddle not with the more profound beyond citing an example.

"One of the greatest obstacles to the progress of philosophy in a more advanced state of human intelligence, and more especially so among the ancients, has been the propensity of writers to poetize truth,—to give to every thing the figure and attributes of humanity, and to dress and decorate these figures with all the license of fancy, till what was designed for illustration obscured its objects, the play of reason sunk into the revelry of sense, and truth and its analogy were lost. This disposition of the pen has undoubtedly been fostered by false taste and the false fame flowing upon writers from the sensuality of readers, by which they have been led to prefer sound to signification, and an elegant diction to correct thought. It is in the ultimate purification of intellect alone that the mind seeks harmony of thought instead of the harmony of sense, and reason and philosophy attain their right end and authority."

Mr. Field maintains that trichotomy prevails throughout nature, and adds,

"We regard all arbitrary triads as unwarrantable, incongruous, and to be guarded against by the philosopher, as leading only to absurdity and confusion; while we maintain it to be a criterion of the genuine philosophic triad that it is either a natural fact or a necessary reason,—correlative, complete, and not to be confuted."

This is his doctrine: and he says further,—

"We claim as universal facts, that all existence is the effect of action and passion (or re-action), and, consequently, of an agent and patient (or re-agent); and that all knowledge is the effect of the concurrence of that-which-knows, or consciousness, and that-which-is-known, or exists."

In conclusion, he states as the result of his whole inquiry, "that the regarding things and thoughts as absolute, and overlooking their true relations or analogy, occasion the manifold errors and misunderstandings which mislead and distract both the learned and unlearned. It is, therefore, incumbent on philosophy to settle these relations, that thoughts and their objects may concur truly, and take their proper places; and, till this is accomplished, opinions and doctrines will vacillate unceasingly: for the absolute in philosophy can only give stability to dissidence, disputation, and error."

"It is a simple truism,—a mere identical proposition,—when we assert that if any thing were perfect it would stand alone,—indigent of nothing,—without relation, and without connexion:

'A perfect monster, which the world ne'er saw.'

This natural imperfection of all things is, then, the principle of connexion among them; just as in music every concord has an intervening discord, and there is a temperament distributing imperfection, by which one octave or system is connected with another in general harmony. In like manner, the gyrations of the heavenly bodies, and the divisions of time, although regular, are imperfect; the week, or lunar quarter, does not perfectly divide the month,—the month imperfectly divides the year,—and there is a temperament or precession by which each year, or course of seasons and of periods, is carried into the cycle or system of another; and so it is throughout the astronomical universe: there are no invariabilities among the works of nature, the whole of which is a regular system of dependent variety and mutation; nor are there any two things that are absolutely alike therein; and all change and variety imply deficiency, or want and imperfection. Thus, discord is essential to harmony,—variety to unity. There could be no light without darkness,—no heat without cold,—no current falsehood without truth,—no liberty without necessity,—no good without evil, nor evil without good,—nor can there be perfection in any thing without imperfection, although there may be perfection of the whole."

The Last Man. A Poem, in Three Cantos. By Edward Wallace. 8vo. pp. 122. London, 1839. Cunningham.

THIS work, with all its faults (and they are many), is not an every-day production. It contains some such stanzas as have not met our eyes of late,—stanzas which abound in true and sterling poetry, and that too of a very high order. Witness the following address to Time, which, without selecting, is the very opening of the poem:—

"Hail, hoary Time! so curst, so often blest,
Into thy jaws must worlds sink one by one;
Still of soul! thou giant king of rest,
Thy earth-destroying course must soon be run!
Thou mighty father of a mightier son,
From thy dark sides will spring Eternity:
When all thy destined labour has been done,
And nought is left to meet thy famished eye,
When Earth and the high Heavens have pass'd away
thou'lt die!

Shadow of dark Futurity! around
Thy dreared form the wasted phantoms sit
Of mighty kings and empires, and the sound
Of wailing nations—horror, and the beat
Thy neighbourhood, where desolations sit
And feed thy gloomy grandeur—near thee are

The ravagers of kingdoms which emit
But temporary evil, for a far
Lies a sweet sleep too sound for thy rough hand to mar.

Gaze, Time, with triumph on the glorious world,
Roll off the frown that lowers above thine eye,
Earth's flag of grandeur proudly is unfurled!
Slay thy quick wings as on thy ruthless fly,
Behold the towering mountain rising high,
As if in scorn of thy overthrowing hand!
Mark the vast forests waving haughtily
Their massive foliage shadowy and grand,
As if their forms defied the terrors of thy wand!"

Here again is something not to be overlooked:—

"Earth, hast thou aught to match a woman's eye,
Dark, deep, and dreamy, as a shaded stream
In everlasting silence rolling by,
With tall trees guarded, o'er whose branches beams
The moon's pale rays, and falling, brightly gleam
Upon the darkened surface, smooth as glass,
Through which we gaze, and form a world where seem
All fairy joys,—far in its depths we pass,
And dwell in ecstasies the world cannot surpass!"

We care not what has been, or may be, said
about this work; for, with all its drawbacks,
there is the right spirit in it; and if the author
would write less about the early death, which
he seems to court, and bestow more of the
artist's skill upon his verses, he would stand
out in this age of many versifiers and few
poets. Let him "gird up his loins" for the
fight; "a faint heart never yet won fair
lady." Sure and certain we are, that he who
wrote the passage which we have marked in
the *Italic* character, in the following poem, can
do something:—

"In vain—in vain—I still live on
To long for Love—but find it not,
And linger round the hopes—which, gone,
Should be forgot.

Will Love upon the faded cheek,
The sinking heart—the wrinkled brow,
Where Time its many troubles wreak,
Its woe bestow?

Ah, no! upon the young—the gay,
Whose footsteps hopes with joy surround,
Ere Care has brushed life's bloom away,
Will Love be found.

Ah, no! in hearts whose wishes play
Like sunbeams round each rising thought,
That mirrors back their purer ray,
Love's throne is wrought.

But not, alas! on hearts like mine,
Whose feelings raise a starless night
O'er hopes, that ne'er again must shine,
Will Love alight.

Ambition—glory of the sky!
Whose trumpet woke my youthful breast,
When proudly rose Hope's kindling eye,
And stainless crest.

Ambition! have I lived so long,
And sought these with a lover's fire,
To find the hopes that seemed so strong,
With life expire?

Too true—too true—no tongue will tell
When Earth has ta'en me back again,
One hope of all that warred so well,
Yet warded in vain!

No soul will swell before my fame,
No eye will read my thoughts anew,
Nor none will know the rank weed's name,
Or where it grew.

Love withered at my hour of birth,
Fame passed me unregarding by,
And I must live alone on earth,
Unhonoured die.

But thou—in youth's most lovely prime,
Who'lt sit with smiles my parting day,
And on the rugged brow of Time,
Didst roses lay;

Thou—who from Beauty's brilliant sphere,
Didst bend in gentleness to raise
The drooping eyes of Care—and cheer
Wo's gloomy ways;

For ever true—for ever blest,
Who didst another's sorrows calm,
And pour into the suffering breast
Most heavenly balm;

Who hearkened to the voice of life,
Nor spurned the wallings of decay,
And watched afar Hope's dying strife,
Nor turned away;

What words—what deeds—can e'er repay
Thy noble spirit?—Ever mine,
Though Heaven and Earth should pass away,
Will worship thine!"

Capital Punishment: the Importance of its Abolition. A Prize Essay. By the Rev. James Peggs. Pp. 117. London, 1839. Ward and Co.

THIS great and much-debated question, involving at this moment the lives of convicted criminals, and, as a consequence of the effects either of execution, commutation, or remission, the lives and properties of multitudes of innocent persons belonging to the community at large, has a zealous advocate for absolute abolition in the reverend gentleman who has carried off this prize. One thing is evident, that the law and practice should be settled, and a determinate course follow conviction. Nothing can be more objectionable than that popular outcry should produce any influence upon the administration of justice. The whole subject ought to be weighed by the highest moral and philosophical balance. What is the value of human life? May it not be over-estimated as we advance in civilisation, as much as it is under-estimated among barbarous nations? And then, it is not the value of life in the guilty alone which should awaken our sympathies—they have infinitely less claim than the guiltless to such consideration;—and the most important social duty is to ascertain by what modes of punishment the safety of the unprotected may be best preserved, and the good of the whole best promoted. The victims must be thought of before the murderers; and the entire circle of society before wicked and ruthless individuals.

Looking at the matter on these broad principles, we have merely to say that this essay is a zealous *ex parte* piece of pleading, and all in favour of that doctrine which denies to man the right of shedding man's blood, however heinous his offences, with the exception of murder.

There is one objection to the next class of infiction for great crimes, transportation; that, however severe it may be (and God knows it is dreadful enough), it does not operate as a public example. The convict is removed and forgotten; the knowledge of his sufferings is limited to himself and a few companions in misery. Solitary imprisonment is another unseen, and consequently in a great measure, as concerns the public, an ineffective punishment. Prisons, we fear, will never be schools of reform; and we should think it a wise thing to devise or extend the system of compelling criminals to work in the view of their fellow-creatures, against whose interests they have offended—a lesson to others, as well as a shame to themselves.

Hallam's Introduction to the Literature of Europe.

[Fourth notice: conclusion.]

THE importance which we attach to this work has led us already to extend our review of it considerably beyond the ordinary limits within which we confine our notices of new publications. We have still the fourth volume before us, which we have not yet touched; and which contains quite as much interesting matter as any of its companions, although, we must confess, not exactly of that kind which will permit us to give many short extracts. A part of this volume is occupied by a continuation of the history of the first half of the seventeenth century, relating chiefly to the scientific progress and discoveries during that period.

The age which followed the Restoration was in England, in a literary point of view, far less interesting than that which had preceded it. Foreign fashions, and a disgraceful licentious-

ness, had produced their effect in vitiating the public taste in its poetry and lighter literature. With the exception of Milton—the old despised commonwealthman—who can hardly be said to have belonged to it, with Dryden, and perhaps Butler, we can scarcely pick out a poet who deserves mention. To make up in some measure for this deficiency, the latter half of the seventeenth century furnishes us, amongst those who turned with disgust from the base intrigues of the court and its statesmen, to seek consolation in the study of philosophy and learning, with the names of Boyle and Locke, of Bentley, of Barrow, Stillingfleet, Tillotson, and Pearson. On the Continent, too, this period produced but a few men whose reputation is still high. We might mention, among critics, Isaac Vossius, Spanheim, Tanaquil Faber, the Dacier, and Henry Valois (Valesius); amongst theologians, there were Fleury, and Bessuet, and Fénelon, with one or two others who were distinguished by their labours; we ought also to mention Bayle; among poets appear the names of La Fontaine, Racine, Corneille, and Molière.

The first passage which presents itself to our view on opening the volume, will probably not be uninteresting to our readers; for it relates to the first beginnings of a society which has recently chosen two of our own contemporary poets into its bosom:—

"Rome was to poetry, in this age, what Florence had once been, though Rome had hitherto done less for the Italian muses than any other great city. Nor was this so much due to her bishops and cardinals, as to a stranger and a woman. Christina finally took up her abode there in 1688. Her palace became the resort of all the learning and genius she could assemble around her; a literary academy was established, and her revenue was liberally dispensed in pensions. If Filicaja and Guidi, both sharers of her bounty, have exaggerated her praises, much may be pardoned to gratitude, and much also to the natural admiration which those who look up to power must feel for those who have renounced it. Christina died in 1690, and her own academy could last no longer; but a phoenix sprang at once from its ashes. Crescimbeni, then young, has the credit of having planned the Society of Arcadians, which began in 1690, and has eclipsed in celebrity most of the earlier academies of Italy. Fourteen, says Corniani, were the original founders of this society; among whom were Crescimbeni, and Gravina, and Zappi. In course of time the Arcadians vastly increased, and established colonies in the chief cities of Italy. They determined to assume every one a pastoral name and a Greek birth-place, to hold their meetings in some verdant meadow, and to mingle with all their compositions, as far as possible, images from pastoral life; images always agreeable, because they recall the times of primitive innocence. This poetical tribe adopted as their device the pipe of seven reeds bound with laurel, and their president or director was denominated general shepherd or keeper (*custode generale*). The fantastical part of the Arcadian Society was common to them with all similar institutions; and mankind has generally required some ceremonial follies to keep alive the wholesome spirit of association. Their solid aim was to purify the national taste. Much had been already done, and in great measure by their own members, Mansini and Guidi; but their influence, which was of course more felt in the next century, has always been reckoned both important and auspicious to Italian literature."

We extract Mr. Hallam's criticism on "Hudibras," which is brief, but, we think, judicious:—

"Hudibras" was incomparably more popular than 'Paradise Lost'; no poem in our language arose at once to greater reputation. Nor can this be called ephemeral, like that of most political poetry. For at least half a century after its publication it was generally read, and perpetually quoted. The wit of Butler has still preserved many lines; but 'Hudibras' now attracts comparatively few readers. The eulogies of Johnson seem rather adapted to what he remembered to have been the fame of Butler, than to the feelings of the surrounding generation; and since his time, new sources of amusement have sprung up, and writers of a more intelligible pleasantry have superseded those of the seventeenth century. In the fiction of 'Hudibras' there was never much to divert the reader, and there is still less left at present. But what has been censured as a fault, the length of dialogue, which puts the fiction out of sight, is in fact the source of all the pleasure that the work affords. The sense of Butler is masculine, his wit inexhaustible, and it is supplied from every source of reading and observation. But these sources are often so unknown to the reader, that the wit loses its effect through the obscurity of its allusions, and he yields to the bane of wit, a purblind, molelike pedantry. His versification is sometimes spirited, and his rhymes humorous; yet he wants that ease and flow which we require in light poetry."

Milton himself belongs rather to the former than to the latter period of this century; yet the most part of his poems was written after the Restoration, when he was no longer involved in the busy whirl of politics, and when the loss of his bodily sight served only to increase the brightness of his mental light. Mr. Hallam has the following remarks on the choice of subject which gave birth to his great epic:—

"The subject of 'Paradise Lost' is the finest that has ever been chosen for heroic poetry; it is also managed by Milton with remarkable skill. The 'Iliad' wants completeness; it has a unity of its own, but it is the unity of a part where we miss the relation to a whole. The 'Odyssey' is perfect enough in this point of view; but the subject is hardly extensive enough for a legitimate epic. The 'Æneid' is spread over too long a space, and perhaps the latter books have not that intimate connexion with the former that an epic poem requires. The 'Pharsalia' is open to the same criticism as the 'Iliad.' The 'Thebaid' is not deficient in unity or greatness of action; but it is one that possesses no sort of interest in our eyes. Tasso is far superior both in choice and management of his subject to most of these. Yet the 'Fall of Man' has a more general interest than the 'Crusade.'"

A little further on, Milton is compared with Dante:—

"To Dante, however, he bears a much greater likeness [than to the other great Italian poets]. He has, in common with that poet, a uniform seriousness; for the brighter colouring of both is but the smile of a pensive mind, a fondness for argumentative speech, and for the same strain of argument. This, indeed, proceeds in part from the general similarity, the religious and even theological cast of their subjects; I advert particularly to the last part of Dante's poem. We may almost say, when we look to the resemblance of their prose writings, in the proud sense of being born for some great achievement, which breathes

through the 'Vita Nuova,' as it does through Milton's earlier treatises, that they were twin spirits, and that each might have animated the other's body, that each would, as it were, have been the other, if he had lived in the other's age. As it is, I incline to prefer Milton, that is the 'Paradise Lost,' both because the subject is more extensive, and because the resources of his genius are more multifarious. Dante sins more against good taste, but only, perhaps, because there was no good taste in his time; for Milton has also too much a disposition to make the grotesque accessory to the terrible. Could Milton have written the lines on Ugolino? Perhaps he could. Those on Francesca? Not, I think, every line. Could Dante have planned such a poem as 'Paradise Lost'? Not, certainly, being Dante in 1300; but living when Milton did, perhaps he could. It is, however, useless to go on with questions that no one can fully answer. To compare the two poets, read two or three cantos of the 'Purgatory,' or 'Paradise,' and then two or three hundred lines of 'Paradise Lost.' Then take Homer, or even Virgil, the difference will be striking. Yet, notwithstanding the analogy of their minds, I have not perceived that Milton imitates Dante very often, probably from having committed less to memory while young (and Dante was not the favourite poet of Italy when Milton was there), than of Ariosto and Tasso."

Of the minor poets after the Restoration:—
"The supremacy of Dryden from the death of Milton, in 1674, to his own, in 1700, was not only unapproached by any English poet, but he held almost a complete monopoly of English poetry. This latter period of the seventeenth century, setting aside these two great names, is one remarkably sterile in poetical genius. Under the first Stuarts, men of warm imagination and sensibility, though with deficient taste and little command of language, had done some honour to our literature; though once neglected, they have come forward again in public esteem, and if not very extensively read, have been valued by men of kindred minds full as much as they deserve. The versifiers of Charles II. and William's days have experienced the opposite fate; popular for a time, and long so far known, at least by name, as to have entered rather largely into collections of poetry, they are now held in no regard, nor do they claim much favour from just criticism. Their object in general was to write like men of the world; with ease, wit, sense, and spirit, but dreading any soaring of fancy, any ardour of moral emotion, as the probable source of ridicule in their readers. Nothing quenches the flame of poetry more than this fear of the prosaic multitude, unless it is the community of habits with this very multitude; a life such as these poets generally led, of taverns and brothels, or, what came to much the same, of the court. We cannot say of Dryden, that 'he bears no traces of those sable streams;' they sully too much the plumage of that stately swan, but his indomitable genius carries him upwards to a purer empyrean. The rest are just distinguishable from one another, not by any high gifts of the muse, but by degrees of spirit, of ease, of poignancy, of skill and harmony in versification, of good sense and acuteness. They may easily be disposed of. Cleveland is sometimes humorous, but succeeds only in the lightest kind of poetry. Marvell wrote sometimes with more taste and feeling than was usual, but his satires are gross and stupid. Oldham, far superior in this respect, ranks, perhaps, next to Dryden; he is

spirited and pointed, but his versification is too negligent, and his subjects temporary. Roscommon, one of the best for harmony and correctness of language, has little vigour, but he never offends, and Pope has justly praised his 'unspotted bays.' Mulgrave affects ease and spirit, but his 'Essay on Satire' belies the supposition that Dryden had any share in it. Rochester, with more considerable and varied genius, might have raised himself to a higher place than he holds. Of Otway, Duke, and several more, it is not worth while to give any character. The Revolution did nothing for poetry; William's reign, always excepting Dryden, is our *nadir* in works of imagination. Then came Blackmore with his epic poems of 'Prince Arthur and King Arthur,' and 'Pomfret with his Choice,' both popular in their own age, and both intolerable by their frigid and tame monotony in the next. The lighter poetry, meantime, of song and epigram did not sink along with the serious; the state of society was much less adverse to it. Rochester, Dorset, and some more whose names are unknown, or not easily traced, do credit to the Caroline period."

We quote the following observations on another class of writing which was numerous during this period,—the comedies on which Pepys often lavishes such unqualified applause, and even prefers them before those of Shakspeare; a clear proof how often the common principles of good taste are regulated by the character of the age:—

"In the early English comedy, we find a large intermixture of obscenity in the lower character, nor always confined to them, with no infrequent scenes of licentious incident and language. But these are invariably so brought forward as to manifest the dramatists' scorn of vice, and to excite no other sentiment in a spectator of even an ordinary degree of moral purity. In the plays that appeared after the Restoration, and that from the beginning, a different tone was assumed. Vice was in her full career on the stage, unchecked by reproof, unshamed by contrast, and for the most part unpunished by mortification at the close. Nor are these less coarse in expression, or less impudent in their delineation of low debauchery, than those of the preceding period. It may be observed, on the contrary, that they rarely exhibit the manners of truly polished life, according to any notions we can frame of them, and are, in this respect, much below those of Fletcher, Massinger, and Shirley. It might not be easy, perhaps, to find a scene in any comedy of Charles II.'s reign, where one character has the behaviour of a gentleman, in the sense we attach to the word. Yet the authors of these were themselves in the world, and sometimes men of family and considerable station. The cause must be found in the state of society itself, debased as well as corrupted, partly by the example of the court, partly by the practice of living in taverns, which became much more inveterate after the Restoration than before. The contrast with the manners of Paria, as far as the stage is their mirror, does not tell to our advantage. These plays, as it may be expected, do not aim at the higher glories of comic writing; they display no knowledge of nature, nor often rise to any other conception of character than is gained by a caricature of some known class, or perhaps of some remarkable individual. Nor do they in general deserve much credit as comedies of intrigue; the plot is seldom invested with much care for its development; and if scenes follow one another in a series of diverting incidents, if the en-

tailements are such as produce laughter, above all, if the personages keep up a well-sustained battle of repartee, the purpose is sufficiently answered. It is in this that they often excel; some of them have considerable humour in the representation of character, though this may not be very original, and a good deal of wit in their dialogue."

We must now hasten to our conclusion; and we will only add a Frenchman's (Bonhours) appreciation of language:—

"Our own pronunciation," he affirms, "is the most natural and pleasing of any. The Chinese, and other Asiatics, sing; the Germans, rattle (*rallent*); the Spaniards, spout; the Italians, sigh; the English, whistle; the French alone can properly be said to speak; which arises, in fact, from our not accenting any syllable before the penultimate. The French language is best adapted to express the tenderest sentiments of the heart; for which reason our songs are so impassioned and pathetic, while those of Italy and Spain are full of nonsense. Other languages may address the imagination, but ours alone speaks to the heart, which never understands what is said in them!" This is literally amusing; Mr. Hallam observes, "and with equal patriotism, Bonhours, in another place, has proposed the question, Whether a German can, by the nature of things, possess any wit?"

We leave this work with regret; it is one of those oases in the desert of good literature, which only presents itself to our view from time to time. On again casting our eyes upon it, as a whole, we can confidently say that it is one of the most valuable works which has been produced for many years; and its author may justly say with the poet,

"Exegi monumentum ære perennius."

MISCELLANEOUS.

The Stranger's Guide to the Roman Antiquities of the City of Treves, from the German of Prof. J. H. Wyttenbach, Director of the Gymnasium at Treves, &c. Edited under the Direction of Dawson Turner, Esq., F.R.S. 8vo. pp. 143. London, 1839. Parker.

FEW places offer more interesting objects for the contemplation and inquiry of the antiquary than the ancient city of Treves, with its Theatre, Amphitheatre, and palatial ruins. These are all fully and ably illustrated in this volume, both by the text and engravings. The curious monument at Igel is a vestige of equal curiosity; and the whole not only deserves the attention of the tourist who visits Treves, but of the readers of history and antiquities in general. The Prussian government, we observe with pleasure, gives an example worthy of all imitation in the careful opening and protection of all antiquities.

The Poetical Works of Robert Burns. 3 vols. (Aldine Edit.). London, 1839. Pickering.

THIS is a very complete edition (perhaps a too-complete edition) of the immortal Scottish bard. The memoir of his life is by Sir Harris Nicolas, enlarged from that published ten years ago; and the preface states that "Since the appearance of the first Aldine edition of the Poems of Burns, great exertions have been made to obtain materials for a more complete collection of his works than had hitherto been given to the world. With this object, upwards of two hundred letters or poems, in Burns's own hand-writing were purchased, many of which had never been printed; while some of those that had been already published had important variations, and, occasionally,

supply even entire stanzas. The possession of these valuable manuscripts led to the resolution of giving, for the first time, a collection of Burns's Poems, containing all the variations in the text which were either found in former editions, or supplied by the new matter thus obtained."

But the strangest matter, and that which induced our foregoing parentheticals, is to be found in the following passage:—

"The possession of so many of Burns's MSS. has enabled the publisher to print a few of the Poet's effusions for the first time; and if it be said that they add little to his reputation, it must be remembered that the avidity of the public for every thing that Burns ever wrote, precludes his editors from performing the most important part of their duty. They cannot venture to reject any poem, however insignificant, unless absolutely indecent, without risking the success of the impression; for the various editions are estimated by the number, and not by the merit, of the pieces they may contain. That this plan of editing Burns's works is as injurious to his fame as it is contrary to his earnest and pathetic injunctions, his present editor is painfully aware. But, for the reason assigned, he was compelled (without any fault of the publisher) to follow a course of which neither his own feelings nor his judgment approved."

Remark upon such a confession would be superfluous.

Romances of History: Tales and Poems, by Henry Neale. Pp. 372. (London, J. Thomas.)—A neat little third edition of these selected remains of a very amiable and gifted writer.

Analysis of One Hundred Voyages to and from India, China, &c., by Henry Wise, late Chief Officer of the Hon. Co.'s Ship Edinburgh. 8vo. (London, J. W. Norrie and Co.; W. H. Allen and Co.)—These analyses may, we presume, be useful to navigators between England and India; but the principal object of the publication appears to be to recommend Melville's steam-propellers as the best auxiliary powers for shortening the voyages.

Advice to a Young Gentleman on entering Society, by the Author of the "Laws of Etiquette." Pp. 144. (London, A. H. Bailey and Co.)—Very excellent advice, if young gentlemen will take it. The style is rather stiff for the subject; and we think, *inter alia*, that the counsel to seek the society of ladies more advanced in life, more educated and finished, in preference to "the young, the fair, and the gay," is very likely to be thrown away; at least it would have been upon us, when we too were young.

Bridges: in Theory, Practice, and Architecture, by James Hann. Parts I. and II. (London, John Weale.)—These parts appeared in March and April, and we had reserved them to notice the work when more advanced; but as we have not seen their continuation, we can only say that they are ably written, and illustrated in a very superior manner.

ORIGINAL CORRESPONDENCE.

"ONE SHILLING" AND "SIXPENCE."

To the Editor of the *Literary Gazette*.

SIR,—It is, and has been, a very favourite assertion for some years, that "the schoolmaster is abroad;" meaning, of course, thereby, that we are a much more enlightened race than our ancestors, though, in their days, possibly, they did not think "small beer" of themselves either:—little cause, as we may opine, they had to be consoled. This cry of the schoolmaster comes chiefly from the party that have furnished us with rulers and governors during the late and the present reign; and they, being doubtless more truly wise than others (or how could they rule this great empire?), and therefore more humble: for pride usually comes through ignorance. Now I am strongly led to suspect that our rulers are of opinion, so far from the schoolmaster being abroad, that "the learned gentleman" is more at home than he used to be, and we (the public), instead of advancing in science, are retrograding in the commonest traditional knowledge of our forefathers, and that we require

instruction on points which, for the last two centuries, every person in the realm, who could be trusted with the custody of sixpence, or one shilling, was presumed to be fully acquainted with, namely, that the silver coin that he, she, or they, respectively held in his, her, or their hands, was a *sixpence* or a *shilling*, as the case then or there might be. But, in 1834, *anno quarto Gulielmo Quarto*,—"The Lords of the Council," after, we may suppose, due and deep deliberation on the state of the country (and possibly knowing that the schoolmaster being abroad, really meant that he was gone to Russia or America), their lordships advertise us, through his majesty's "Gazette," that two silver coins were to be issued for the convenience of trade; one of the value of twelve pennies, having imprinted on it "*One Shilling*," and another of the value of six pennies, having imprinted on it "*Sixpence*;" thus thinking it necessary to afford that instruction to the students of London College which the hornbook scholars of past ages were not supposed to require! And I perceive by the coinage of the shilling and sixpence of Queen Victoria, A.D. 1838, that the same careful consideration is paid to the lack of knowledge of all her present majesty's liege subjects, as in the days of her majesty's uncle, of naval and famous memory.

When a coin was struck for currency, which had not been in circulation for two centuries—the groat, and which came so close to the sixpence, it might be held to be excusable, putting the value "*Fourpence*" on it, though it is remarkable that in this smaller coin it was found that there was quite room enough to give a Britannia, and place the value in the circle; whereas, on the larger coins, there was only room for the value, surrounded, it is true, by branches of laurel and oak, indicating, of course, that England was fagotting up glory, domestic and foreign, by cartloads.

Now, as one of the many who consider the coinage of our empire as one of national honour or disgrace, I protest against this ridiculous and uncalled-for degradation of our shilling and sixpence. If we have not either the spirit or the genius to make the coinage *medallic*, on the system of the Greeks and Romans, at least let us not sink it lower than it was, by substituting a mere unnecessary inscription for the armorial bearings, a national personification. But if you think the Lady Britannia is too favoured, why not admit St. Andrew, St. Patrick, and St. David, to all the numismatic honours; and blazon whatever may be most remarkable, or most picturesque, in their legends on the coinage? And then, if the Mint is gallant, they may vary the same subject by adopting the reverse of William Wyon's pattern crown of George III. on the union with Ireland, and present us with his lovely group of the Graces, representing on this occasion, Britannia, Scotia, and Hibernia. At the same time the armorial bearings may be varied *ad infinitum*, so that if novelty is the one thing indispensable, we have no lack of excellent materials on which to ring the changes, without sinking to prosaic dullness; or pompously conveying instruction to the empire, which no child in it of five years growth admits the need of!

I certainly would wish to see the Greek and Roman system of historical reverses added to our heraldic, which latter I think quite as proper in their way as the personification of kingdoms and provinces on the classic coinages. And I do not consider the objection generally raised against it, "that we are too divided in politics," at all tenable.

We are not an iota more at daggers drawn than the ancients were, nor have we fewer objects on which we are all agreed. Analyse the philippics of Lord Brougham, and, with all their living blood and marrow, I doubt if you will extract ten per cent more oil of vitriol, than you will when you have decomposed the dry, or rather the petrified, bones of Demosthenes. Look into the chapel of St. Stephens for any particular Christian affection subsisting between Whigs, Liberals, Radicals, and Conservatives; and probably, even with the aid of the lantern of Diogenes, the Speaker's return may be "Non est inventus." Yet I am extremely sceptical whether Lord Stanley would resort to "cold steel" to put down Mr. O'Connell; or that Lord John would employ it to get rid even of Sir Robert; although they could refer to the "precedent" of the Ides of March, on the motion of Sir Brutus to remove the Lord Julius from the head of the then government.

And supposing that the "Lords of the Council" on this, my very meek and humble representation, respecting the Shillings and Sixpences of 1834 and 1838, were "to hold a solemn meeting," and with all the treasures of the ancient mints "laid on the table," it was then "resolved" to make a trial of the antique; and imagine that in the outpourings of warm-hearted loyalty and devotion, the Lord Melbourne should select the beautiful and expressive personification of Hope from the imperial series (a female holding in her right hand an expanding flower, and pressing onward, in all the animation of joyous life, and all the grace of opening beauty), as the first star in the new system, to be adopted as the personification of our youthful queen, "*Spes Imperii Britanniarum*;" and the suggestion passed with enthusiastic acclamation;—but that before Wyon could engrave the die, the noble viscount was removed "to another and a better world," and that "the duke" again became "the Atlas of a sinking state;"—do you think his grace, with the seals of office, would bring to the council-table a less chivalrous affection towards his royal mistress, and rescind the order? I guess something very different; something like a hunt, and no mistake, to the master,—that despatch, was expected, with this addition to the motto, "*Esto Perpetua*."

Again, when, at this my board of green cloth, it came to Mr. Spring Rice's turn "to name a coin," and well knowing how satisfactory it is to the British creditor duly to receive his "dividend on the 5th January and the 5th July," the calculating chancellor of the exchequer should fix on the "*Fides Publica*" of the same imperial series before him, and that ere this coin was ready to be issued, he was rusticated on the banks of the Shannon, and studying Davy's "*Salmonia*;" do you believe that the dragon of Tamworth would be less watchful of the golden fruit, or less anxious to impress on the Stock Exchange the stability of "the public credit?" Though he did not beget the child, he would paternize it, and say, with a clear conscience, "the wish is father to the thought." But to return from these future possibilities to our present actualities, let us at least maintain the high position of the coinage of George IV., A.D. 1825, 1826; which, taking the combined sets of gold, silver, and copper, from the five-sovereign to the one-farthing, I consider to be a series of coins that no mint in Europe at this moment can equal, and I speak after having examined the drawers of a friend's cabinet, who has collected every current coin

on the Continent, and fearlessly I challenge comparison or competition. No modern coinage, with its indispensable precision and neatness of edge, obliging it to be struck in a collar, can have the relief of a Greek coin. But looking up to Greek work as our acknowledged standard of excellence, I hold the bust of George IV. on this series to have very high merit, for breadth, softness, and dignity of bearing and expression; they will transmit his posterity, as a most princely sovereign. Turn to the reverse, where the regal magnificence of the five-sovereign, the baronial splendour of the crown, and the classic Britannia of the penny, which will not shrink from a comparison with any similar personification of imperial Rome,—all, all are worthy of the obverse; and, until something better could be produced, we might have been contented with what we had.

I will now only further trespass on your space, by glancing at the bad taste of having inscriptions in two languages on these shillings and sixpences of 1834–1838, Latin on the obverse, and English on the reverse, which I think cannot be defended by any canon of classic literature. As inscriptions on coins are for the information of the public, I would say, as a general rule, that it is better to use the language of the country, and therefore on English coins I would place English inscriptions. The East India Company have adopted English inscriptions on the silver coinage of William IV., the first bust that for very many centuries has appeared on an Indian coin. I wish we could say any thing as to its merits, either in design or execution. This, by the way. But as the English are only a very fractional number among the hundred millions of Hindostan, I would rather have inscribed the king's titles in the languages of India, and so have made the might and the majesty of his power known as extensively as possible among the nations of the East.

R. S.

Corf, 36th March, 1839.

ARTS AND SCIENCES.

BRITISH ASSOCIATION.

[At Birmingham.]

THE Meeting, we rejoice to find, promises to be very fully attended; and also that every thing indicates a quiet and interesting display, not only of mechanical improvements, but of those advances in science which are usually brought forward on these occasions. The Model Gallery, which did so well at Newcastle, will probably be still more efficient in this great manufacturing place, on the second trial of that experimental exhibition. The town is now perfectly tranquil, and there is no reason to apprehend that it will be otherwise; and every preparation has been made to give a cordial reception to the members of the Association. The meeting of the general committee to settle for the ensuing week, is to be held on Saturday next; and on Monday the Sections meet. Lodging books have been provided; and Mr. Phillips has been some time past on the spot making those useful preparations which his experience and judgment suggest, and which have hitherto been found so beneficial in promoting good order and regularity in every department of the Association. The Local Secretaries, too, have been indefatigable in their exertions, and passed frequently between Birmingham and London to complete the entire arrangements in the best possible manner.

NIGRITIA, ETC.

THE following are among other remarks addressed by a correspondent of "*The Times*"

to that journal, on the subject of the "expedition of the viceroy of Egypt to Nigritia (an account of which appeared in the *Literary Gazette* of the 6th July), having visited Nigritia, or the Beled-Es-Soodan, and having, during a residence there of more than eight months, mixed and associated with the Turks, Arabs, and slaves, the oppressors and the oppressed, the writer thinks he may endeavour to explain the motives of the statement which has evidently been put forth under the cognisance of Mehemet Ali Pasha himself:—Previous to 1837, he had heard that Shaboon and Fazoole possessed productive and prolific gold mines; and in the spring of the same year Col. Rusigger was despatched to both mines, at the joint expense, I believe, of the Austrian and Egyptian governments, and Signor Boreani, an employé of Mehemet Ali, was sent to Fazoole only. I have (continues Mr. Holroyd) seen nothing of Col. Rusigger since his return; but I have seen and conversed with Boreani upon the result of his expedition, and he distinctly informed me that the mines of Fazoole were so productive, that a labourer, at wages of twenty paras (about five farthings) a-day, could with ease obtain gold in ore or dust of the value of two and a half dollars, or ten shillings sterling. Is it, then, a matter of surprise that the pasha should have been desirous of increasing his revenue by monopolising the auriferous productions of this country, when his emissaries returned with such a dazzling account of its resources? There was, however, another reason for his leaving Alexandria. [This being political, we omit.] Mehemet Ali had also a haunter after Abyssinia; he had despatched 10,000 troops up the Nile to its confines, in the autumn of 1837, and these were still in the Beled-Es-Soodan. And then we find him leaving Cairo in the autumn of 1838 with 10,000 more, under the pretext of visiting and working the mines, whilst nothing was said about his wish, if a favourable opportunity offered, of interesting himself about Abyssinia. When he reached Fazoole he found, however, that the accounts of the produce of the mines had been grossly exaggerated; and that instead of a labourer being able to obtain daily gold worth ten shillings, it would be with great difficulty that he could procure gold worth five-pence, and that the large number of soldiers required to protect the workmen would hardly, when all expenses were paid, leave a nominal balance in favour of the pasha. A few months previous to Mehemet Ali undertaking this journey, he sent a peremptory order to M. Linant, his chief engineer, to request him immediately to blow up, in three months, all the cataracts between Cairo and Sennar, that he might steam from his capital to Fazoole. Linant very properly replied, that he would not undertake to accomplish this stupendous undertaking under ten years; and he was consequently informed that the pasha did not longer require his services. It appears, then, that Col. Hageddin Bey received instructions to effect this passage through the rapids, and, like all Egyptians, undertook that which it was impossible to effect; for, as the result proved, the steamer was obliged to stop at Essooum, and the pasha continued his journey in dahabeehs. Since his return, Linant had been recalled to the service. We are told that the mountains and valleys of Nigritia abound in all kinds of curious animals. There are birds with four wings. I did not visit Fazoole; I did not proceed higher than Sennar. I was told that if I did go there I should see these quadrilateral monsters, as well as another

variety of birds, very common, with the body of a pig and the head of an ass. My informant had the candour to say he had never seen them, though he had heard people say that they had friends who had.

'Credat Judæus, non ego.'

FRENCH ARTS AND MANUFACTURES.

WE extract the following description of the recent Exhibition of Arts and Manufactures, in the Champs Elysées, at Paris, from a very interesting article on the subject, in the "Foreign Monthly Review," No. IV.—

"The exhibition in question was placed in some very elegant galleries constructed in the Champs Elysées, with all the taste and skill of simple decoration for which the French are now so much distinguished. Four very large galleries, communicating with an enormous transverse one, and several supplementary galleries, contained the products of upwards of 4000 exhibitors from all parts of France, but more than half of whom were from the department of the Seine alone. The first gallery contained all the machinery, agricultural instruments, models of all sorts, specimens of iron and other metals, &c. The second comprised a miscellaneous assortment of things, truly French, and uncommonly dear, not only to Parisians, but to all visitors of the gay capital: hats, wigs, shirts, stays, bon-bons, perfumery, colours, chemical products, cutlery, stationery, guns, pistols, canes, &c.; in fact, every thing that could come under the head of personal nicknacks. The third gallery, with a supplementary one, was filled with all the woollen and linen stuffs, shawls, lace, muslins, cotton goods, &c. The fourth also, with a supplementary gallery, displayed an immense collection of furniture, carpets, musical instruments, bronze-work, clocks and watches, philosophical instruments, jewellery, &c. The fifth, or transverse gallery, besides holding the porcelain, the glass, the mirrors, &c., was devoted to a miscellaneous collection, that, by itself alone, would have formed a first-rate exhibition. The galleries themselves were internally decorated in the style of the *Renaissance des Arts*, now the only fashionable style in the French metropolis; the windows were all filled with stained glass, or the coloured blinds exhibited; and the walls were all hung round with the carpets, the paper-hangings, the varnished leathers, &c.; producing at once a varied and even gorgeous effect: in fact, the *coup d'œil* of the whole was one of the most beautiful things we ever saw. As we have before remarked, the excitement caused by this great exhibition, the periodical return of which appears to be now definitively fixed at five years, was exceedingly intense, not only in the capital but all over the country: the exhibitors who flocked up to Paris with their products, brought each his train of friends or relations; many people came to the centre of the nation for this very purpose alone, and considerable numbers of foreign manufacturers and visitors were observed to be thronging the galleries whenever they were open to the public. Five days in the week, during May and June, the public were admitted indiscriminately, and we need hardly add gratuitously, to every part of the exhibition; the other two days, and certain reserved hours on the five days, were kept for the *élite* of the public, admitted by tickets; on these, too, the royal family, who bought very largely there, used to go. We have no means of estimating the daily number of visitors, nor indeed of how many the galleries would hold; but we know that the influx and efflux of the throng was incessant, and at a rough guess we

should think that about 5000 persons were always in them. During the last week before its closing, the crowd was so great that a regular *queue* was formed as at a French theatre, from twelve o'clock till four daily, and extending about three hundred yards from the doors in a file of three or four abreast. Notwithstanding this immense concourse of people, high and low, known and unknown, good, bad, and indifferent, for every body went, so admirable were the regulations of the police, the armed force, and the internal superintendence, or rather so good was the average conduct of the public, that not a single severe accident occurred during the two months just mentioned, nor any more serious offences than pockets picked were heard of; these, too, were very few in number. The truth was, that the exhibition formed an intellectual treat of the highest order, where the curiosity of every one was sure to meet with some object or other of gratification; nobody came away disappointed; there was no occasion or desire for mischief; the whole passed off tranquilly. This, too, be it remembered, was at the very time when the insurrection of the 12th and 13th of May occurred. The exhibition was closed for one day, that was all; and the king at his succeeding visits, came with a more numerous attendance of guards and police officers. All this speaks volumes for the general good conduct of the people, and is, indirectly at least, a proof of the humanising influence of practical science, even on a turbulent and restless people."

LITERARY AND LEARNED. ROYAL SOCIETY OF LITERATURE.

Anglo-Saxon Literature.

"*Fate of the Anglo-Saxon Language and Literature.*—During the period of which any written monuments in the Anglo-Saxon language are preserved, extending from the eighth century to the Norman conquest, it seems not to have undergone any great change. But soon after the entrance of the Normans, its use as a written language was superseded, first by the Latin tongue, which, introduced by the foreign ecclesiastics, again took the station which it had occupied in the eighth century, and continued to flourish until the middle of the thirteenth; and secondly, by the Anglo-Norman, a Neo-Latin dialect, which was the vernacular tongue of the invaders, and was not laid aside until the beginning of the fourteenth century. It is probable that the Anglo-Saxon tongue preserved its purity until the beginning of the twelfth century; but it then began to experience the influence of the great political revolution which had been effected in England. It was by degrees subjected to a general organic change of many of its letters; syllables were cut short in the pronunciation; and the final terminations and inflections of words began to be softened down, until at a later period they were entirely lost. In the latter years of the Anglo-Saxon chronicle, which closes with A.D. 1155, we see that the language had already degenerated much from what it was fifty years before; and the change is still more apparent in the fragments lately published by Sir Thomas Phillipps. We have scarcely any other documents in the English tongue which can be ascribed with certainty to the twelfth century; but when we come to the age of Layamon, in the earlier half of the thirteenth, we find the transformation so complete, that it may be doubted whether the uncorrupted language of the Anglo-Saxon writings could then be understood without much difficulty. During the thirteenth century, this organic change proceeded

so rapidly, that there is quite as wide a difference between the language of Layamon, and that which was written at the beginning of the fourteenth century, as there had been between the former and that written in the tenth, or as there is between the English language as written in the reign of Edward the Second, and the same tongue as we possess it at the present day. The form of our language during the twelfth and the first half of the thirteenth century is generally termed Semi-Saxon; from that period to the time of the Reformation, it has received from modern philologists the name of Middle-English. The greatest destruction of Anglo-Saxon books happened during the numerous inroads of the Danes, from the ninth to the eleventh century, when so many of the richest libraries were committed to the flames, along with the monasteries in which they were deposited. Under the rule of the Normans, from the Conquest to the beginning of the thirteenth century, our old chroniclers relate many stories illustrative of the contempt with which the Anglo-Norman barons regarded the language of those whose rights they had usurped; but the more serious disputes related to charters rather than books, the latter (except when, from time to time, some English monk took them down) were allowed to lie neglected in the dust of monastic libraries, and the only losses which they sustained seem to have been the natural consequences of dirt and damp. But after this period the case was entirely changed, and, as they could no longer be read even by Englishmen, they had to suffer from various causes. A few monastic catalogues are still preserved in manuscripts of that age, and they contain the titles of many Anglo-Saxon books, which, however, are generally described as being 'old and useless.'* Accordingly we find, that when the monks were in want of vellum, they scrupled not to take one of these 'old and useless' Anglo-Saxon manuscripts; and, having carefully scraped out the original letters, to make use of it for writing a new work, which they considered more important and necessary. One of these *palm-pests* is preserved in the Library of Jesus College, Cambridge, in which a splendid copy of the Anglo-Saxon homilies of Alfric has been erased to make room for Latin decretals, although the destruction of the original was not so complete as to hinder us from tracing here and there a few words, particularly about the margins of the leaves. Sometimes, also, when the monks were at a loss for boards to bind their books, they took a few folios of these useless old manuscripts, and pasted them together; as was the case with the leaves discovered by Sir Thomas Phillipps in the covers of a volume preserved in Worcester Cathedral. The loss which Anglo-Saxon literature sustained by these means must have been very great. At the time of the Reformation, when, by the dissolution of the monasteries, their libraries of manuscripts were scattered in all directions, the number which perished cannot now be calculated, though the fragments which are found in the old bindings of books are sufficient to convince us that it was not small. The Anglo-Saxon manuscripts, however,

* "See, for example, a catalogue of the books in the library at Glastonbury, made in 1246, and printed by Wanley, in the introduction to his catalogue of Saxon manuscripts, from a MS. in the library of Trinity College, Cambridge. We find several entries like the following:—

Item, duo Anglica, vetusta et inutilia.

Item, Sermones Anglici, vetusti, inutilis.

Passionale Sanctorum Anglice scriptum, vetust. inutilis. The second of these items was a volume of Anglo-Saxon homilies."

suffered much less at this time than the others, owing to the eagerness of the reformers to collect them; yet we still find a few fragments in the covers of books printed during the sixteenth century. The two great collectors of Anglo-Saxon manuscripts in the sixteenth century were Matthew Parker, archbishop of Canterbury, and Sir Robert Cotton. At the time of the Reformation, when church property was not always regarded with the same respect as at present, Parker found no difficulty in transferring most of the Anglo-Saxon manuscripts which were found in the libraries of cathedrals and churches into his own collection. Sir Robert Cotton was equally successful in gathering together those which had passed, by the plunder of the monasteries, into the stalls of booksellers or the hands of private individuals; and these two libraries, the former now preserved in Corpus Christi College, Cambridge, and the latter in the British Museum, are still the richest in Anglo-Saxon literature. Next in the scale we must place the Bodleian Library at Oxford, with the University Library at Cambridge, and one or two of the college libraries. The royal library in the British Museum is perhaps the richest of them all in Anglo-Saxon manuscripts of Latin books; and this, as well as the Harleian Library, and some other public and private collections, possess also a few scattered volumes written in the vernacular tongue. It has been already observed that public attention was first directed to the remains of our Anglo-Saxon forefathers, by the support which they afforded to the arguments of the Reformers.* Soon after the middle of the sixteenth century, Fox the martyrologist, and William P'Isle, under the auspices of Archbishop Parker, prosecuted the study of the Anglo-Saxon language, and published the Anglo-Saxon version of the gospels and some of the homilies. But their knowledge of the language was very imperfect, and confined entirely to the prose writings; for the difficulties they had to encounter, without grammar or dictionary, were too formidable to allow of their making much progress. About the middle of the seventeenth century flourished Spelman, Gibson, Whelock, and Junius, who gave to the study of the Anglo-Saxon language a new character. The first of these scholars was preparing to establish an Anglo-Saxon professorship in the University of Cambridge, when his intentions were thwarted by the turbulent times which followed. Sir Henry Spelman published the *Ecclesiastical Laws* in 1639; and his son edited the Anglo-Saxon Psalter in the following year. In 1643, Whelock printed Alfred's translation of Bede, with part of the 'Chronicle.' Junius gave an edition of the poetry attributed to Cædmon, in 1655. In 1659, Somner published the first Anglo-Saxon dictionary. From this period to the end of the century, numerous distinguished scholars were working zealously to bring to light new documents of Anglo-Saxon literature, and to facilitate the study of the language. Among others we may enumerate Bishop Gibson, Thwaites, Rawlinson, Hickes, and his niece Elizabeth Elstob. In 1689, Hickes published the first Anglo-Saxon grammar; a book containing, as might naturally be expected, many errors, which later discoveries, and a more extensive reading, have corrected: but which, nevertheless, was then of great service

vice to the cause of Anglo-Saxon philology. In 1692, Bishop Gibson printed a more complete edition of the Anglo-Saxon 'Chronicle;' and in 1698, Rawlinson published King Alfred's translation of Boethius, which was followed, in 1699, by Thwaites's edition of the Heptateuch. In 1701, an Anglo-Saxon vocabulary was published, in an octavo volume, by Thomas Benson; and four years afterwards, appeared the celebrated 'Thesaurus' of Dr. Hickes. After the beginning of the eighteenth century, the study of the Anglo-Saxon language soon fell into neglect; and it was long regarded as a mere toy for the amusement of antiquaries. The only works of any importance which were given to the world during this long period, were the 'Laws,' by Wilkins, in 1721 and 1737; Alfred's 'Bede,' by Smith, in 1722; and the great Anglo-Saxon Dictionary, by Lye and Manning, in 1779,—a monument of unwearied industry, but disfigured by a multitude of errors. In 1773, Daines Barrington published an ill-executed edition of King Alfred's translation of Orosius. In 1750, the Anglo-Saxon professorship was founded at Oxford, and brought into effect in 1795. We owe the revival of the study of the Anglo-Saxon language and literature at the present day, in some measure, to foreign scholars, whose attention was frequently given to it at the latter end of the last and the beginning of the present century. In 1815, Thorkelin, a Dane, published the first edition of the 'Romance of Beowulf;' which is, however, a very incorrect book. A few years later, Erasmus Rask at Copenhagen, and Dr. James Grimm in Germany, began to apply a more enlarged system of philology to the language. About the same time, the literature of our forefathers began to attract the attention of scholars in England, and was industriously cultivated by Conybeare, Ingram, and Bosworth; and, after the space of a century, the place formerly occupied by Elizabeth Elstob was supplied by a worthy successor in Miss Gurney. The systems of Rask and Grimm, as applied to Anglo-Saxon philology, have since taken a more substantial form under the hands of two native scholars, Thorpe and Kemble. Thorpe's translation of Rask is the best grammar which has yet appeared. A portable dictionary has been published recently by Dr. Bosworth; so that the impediments which formerly hindered the study of the Anglo-Saxon language are now entirely removed. Yet still, from the deficiency in many classes of documents, and from the recent period at which it has been studied in a true philological spirit, it is a language which is but imperfectly known."

With this we conclude our Illustrations of Anglo-Saxon Literature, &c. from Mr. Wright's very excellent Essay. Hoping and expecting that the "Biographia Britannica Literaria," to which it is the preface, will be altogether worthy of such an introduction, and of the Royal Society of Literature, under whose auspices the work is to be produced, we now leave it in good hands.

FINE ARTS. NEW PUBLICATIONS.

The Pictorial History of Palestine. By the Editor of "The Pictorial Bible." Part I. London, 1839. Knight and Co.

AMONG the many extraordinary projects of the present period, one of by no means the least startling is the attempt on the part of a number of opulent individuals of the Jewish persuasion to obtain possession of Syria by purchase! Whether that attempt prove success-

ful or not, it must undoubtedly communicate for the time an additional interest to every thing that respects "The Holy Land." If it were in that point of view alone, the work under our notice is calculated to be favourably received by the public; for its main object is stated to be, "to relate every event of interest or importance in the political, social, military, and religious history of the country called Palestine, from the most remote ages to the times in which we live. It will thus be in the largest sense *A History of Palestine*, and not merely of the Hebrew nation; but, seeing that it is only its connexion, and the consequences of its connexion, with the history of the Hebrew people, which has rendered this small country of historical importance, it is also intended that the present volume should be complete as *A History of the Jews*;—not leaving them, as most histories do, when they were utterly cast forth from their old possessions; but while, on the one hand, the history of the country is still continued, on the other, pursuing the people into all the places of their dispersion."

But, besides the extrinsic value which this publication may derive from the peculiar circumstances of the times, its intrinsic merits, if we may judge from the part under our notice, will be such as to entitle it to extensive circulation. The text is at once copious and condensed; and the illustrations are fine specimens of the excellence to which the art of engraving on wood has attained. Among the most beautiful of these cuts are, "Crusaders approaching Jerusalem," "Ruins of Jerash," "Mountains of Galilee and Samaria," "Aradus," and "Boudin Encampment."

Constantinople and the Scenery of the Seven Churches of Asia Minor Illustrated. In a Series of Drawings from Nature by Thomas Allom. With an Historical Account of Constantinople, and Descriptions of the Places, by the Rev. Robert Walsh, LL.D., Chaplain to the British Embassy at the Ottoman Porte. First Series. 4to. Pp. 84. London and Paris, 1839. Fisher, Son, and Co.

"NOTHING," observes Dr. Walsh, "can form a stronger contrast, in modern times, than Asiatic and European Turkey. The first preserves its character unchanged—men and things still display the permanency of Oriental usages; and they are now as they have been, and will probably continue to be, for an indefinite period. Not so the second—Constantinople having for centuries exhibited the singular and extraordinary spectacle of a Mahomedan town in a Christian region, and stood still while all about it were advancing in the march of improvement, has at length, as suddenly as unexpectedly, been roused from its slumbering stupidity; the city and its inhabitants are daily undergoing a change as extraordinary as unhoped for; and the present generation will see with astonishment that revolution of usages and opinions, during a single life, which has not happened in any other country in revolving centuries. The traveller who visited Constantinople ten years ago, saw the military a mere rabble, without order or discipline, every soldier moving after his own manner, and clad and armed after his own fashion; he now sees them formed into regular regiments, clothed in uniform, exercised in a system of tactics, and as amenable to discipline as a corps of German infantry. He saw the sultan, the model of an Oriental despot, exhibit periodically to his subjects with gorgeous display; or to the representatives of his brother-sovereigns, gloomy and mysterious, in some dark recess of his

* "It has been said, that so early as the fifteenth century, the monks of Tavistock applied themselves to the study of the Anglo-Saxon language, and that they even printed a grammar. No traces, however, of such a book can now be found; and it may have been a mere error, arising from the indefinite manner in which some people formerly applied the term Anglo-Saxon."

seraglio: he now sees him daily, in European costume, in constant and familiar intercourse with all people: abroad, driving four-in-hand in a gay chariot, like a gentleman of Paris or London; and, at home, receiving foreigners with the courtesies and usages of polished life. He formerly saw his kiosks with wooden projecting balconies, having dismal windows that excluded the light, and jealousies closed up from all spectators; he now sees him in a noble palace, on which the arts have been exhausted to render it as beautiful and commodious as that of a European sovereign. He formerly saw the people listening to nothing, and knowing nothing, but the extravagant fictions of story-tellers; he now sees them reading with avidity the daily newspapers published in the capital, and enlightened by the realities of passing events. It is thus that the former state of things is hurrying away, and he who visits the capital to witness the singularities that marked it, will be disappointed. It is true it possesses beauties which no revolution of opinions, or change of events, can alter. Its seven romantic hills, its Golden Horn, its lovely Bosphorus, its exuberant vegetation, its robust and comely people, will still exist, as the permanent characters of nature: but the swelling dome, the crescent-crowned spire, the taper minaret, the shouting muezzin, the vast cemetery, the gigantic cypress, the snow-white turban, the beniche of vivid colours, the feature-covering yasmak, the light caïque, the clumsy arrubbas, the arched baycove—all the distinctive peculiarities of a Turkish town—will soon merge into the uniformity of European things, and, if the innovation proceed as rapidly as it has hitherto done, leave scarce a trace behind them. To preserve the evanescent features of this magnificent city, and present it to posterity as it was, must be an object of no small interest; but the most elaborate descriptions will fail to effect it. It is, therefore, to catch the fleeting pictures while they yet exist, and transmit them in visible forms to posterity, that the present work has been undertaken, and, that nothing might be wanting, Asiatic subjects are introduced; thus presenting, not only the Turk of one region as he was, but of another as he is, and will continue to be. The views are accompanied with letterpress, describing the usages, customs, and opinions of the people, as ancillary to the pictorial representations; and a map of the Bosphorus is added, pointing out localities, and directing attention to the spot on which the reality stood, or still stands. To complete the whole, an historical sketch of the city from its foundation is annexed, with a chronological series of its emperors and sultans to the present day; thus combining a concise history of persons and events, with copious details of its several parts, and vivid and characteristic representations of its objects."

To the above comprehensive description of the object of this beautiful volume, we will only add that that object appears to us to have been most happily accomplished. In noticing former works from the same publishers (and this as it "liped in Numbers"), we have frequently had occasion to speak of Mr. Allom's talents. They are evinced in the publication before us in a very high degree; for, besides the topographical fidelity, and mastery of picturesque effect by which his pencil has hitherto been distinguished, he has here introduced into his different views groups of figures, exhibiting in the most pleasing manner, not only the rich and various costumes of the people, but their character, customs, and ceremonies. Dr. Walsh's brief history of Con-

stantinople, and his explanations of the plates, contribute greatly to the interest and value of the work. At the present moment, when the affairs of the East are in so critical a state, the appearance of this volume is singularly opportune.

A Series of Lithographed Drawings of the London and Birmingham Railway. By John C. Bourne. With Topographical and Descriptive Accounts of the Origin, Progress, and General Execution of that Great National Work, by John Britton, F.S.A. Parts III. and IV.

IN accounting for the long interval that has elapsed since the appearance of the second part of this beautiful publication, the publishers state that it had been thought advisable to bring the work to a termination in three, instead of four parts; to effect which, it became necessary to defer the publication until much beyond the time originally contemplated: but they express their hope that the delay will be found to have conduced materially to the improvement of the work. The present part contains the whole of the letterpress, and eighteen drawings, making, with those already published, the total number of drawings comprised in the work; viz. thirty-seven, instead of thirty-three, as promised in the original prospectus. We have already expressed our admiration of Mr. Bourne's lithographic drawings. Those immediately under our notice are at least equal (we rather think superior) to their predecessors, in the interest of the subjects, and in the picturesque and masterly style of their execution. Mr. Britton's "Topographical and Descriptive Accounts" are full of useful and entertaining information. Would it not answer to print them in a form for the pocket?

Medical Portrait Gallery. Biographical Memoirs of the most celebrated Physicians, Surgeons, &c. &c. who have contributed to the Advancement of Medical Science. By Thomas Joseph Pettigrew, F.R.S., F.S.A., F.L.S., &c. &c. Parts XIII. to XVIII. Whitaker, and Co.

THE thirteenth part of this able work was the commencement of a new series, with some modifications of the original plan of publication. The principal of those modifications were,—devoting the usual quantity of letterpress which had been assigned for three memoirs to two; enriching the letterpress with the occasional introduction of woodcuts, to represent any new instruments, or other interesting matters, connected with the memoirs; giving facsimiles of entire letters of some of the most distinguished individuals of ancient times, and even copies of some of their prescriptions, &c. &c. To professional men, these improvements must have greatly enhanced the value of the Gallery. The portraits in these six parts are those of Boerhaave; Benjamin Travers, F.R.S.; William Heberden, M.D., F.R.S.; A. P. W. Philip, M.D., F.R.S.; John Cheyne, M.D., F.R.S.E.; George G. Sigmond, M.D., F.S.A.; William C. Cruikshank, F.R.S.; James Annesley, Esq.; James Ware, F.R.S.; Sir Charles Bell, K.H., F.R.S., L. and E.; Hippocrates; and John Boetock, M.D., F.R.S.

Sterne's Sentimental Journey, through France and Italy. Illustrated with One Hundred Engravings on Wood, executed by first-rate Artists, from Original Drawings by Jacques Part I. Nicholls.

WE regret that we are unable to notice this publication in terms of praise. Technically speaking, the cuts are well executed; but they

are far from conveying an adequate idea of the spirit, beauty, pathos, and peculiar character of the admirable work which they profess to illustrate.

Church Architecture of the Middle Ages. A Series of Etchings of Cathedrals, Churches, Hospitals, Monasteries, Friaries, and other Ecclesiastical Edifices remaining in England. By John Coney. The Descriptive Account of each Building by the Rev. J. A. Giles, LL.D. Part I. London, 1839. Bohn.

THIS publication, in which, for the accommodation of persons not wishing to take the whole work, a county arrangement is to be adopted, begins with Yorkshire; and of course the magnificent and venerable minster of York occupies a considerable portion of the first part. Of the twelve plates which constitute the part, six are views of its exterior and interior; the remaining six plates are views of Fountains' Abbey, Kirkstall Abbey, Kirkstall Crypt, Rivaux Abbey, Selby Church, and Richmond, Grey Friars. The public eye has of late been so accustomed to elaborate and highly finished engravings, that we fear the plain and unpretending simplicity of Mr. Coney's style, formed upon the topographical productions of former days, will not be so generally admired as it ought to be. Dr. Giles's descriptive accounts are as satisfactory as their brevity will permit.

THE DRAMA.

Her Majesty's Theatre.—Another week (including Labache's benefit on Thursday) has been added to the finale of last Saturday, and the theatre closes after to-night. We are assured that the monied speculators in this property have, this season, cleared 10,000*l*. Mr. Laporte having a liberal allowance as manager. The advertisement for sale is merely a legal annual form, necessary in consequence of the involved state of the property.

The Haymarket is most unremitting and enterprising in its exertions, and the efforts of its lessee, Mr. Webster, are such as absolutely "to command success." During the present week we have had Power, in all his rich and native humour, drawing bumper houses; and the Queen herself to see the inimitable *Teddy the Tyler*. But not content with his high comic attractions, and they are of a first order (including Farren, Strickland, himself, Buckstone, Lacy, Hemming, O. Smith, Mrs. Glover, Mrs. W. Lacy (Miss Taylor "as was"), Mrs. F. Matthews, Mrs. Fitzwilliam, Mrs. W. Clifford, &c. &c.), he announces Macready to commence his engagement with *Othello*, on Monday, and Miss Ellen Tree to appear as soon as Power's too-brief period is over. Miss Helen Faucit, Mrs. Warner, Miss P. Horton, are also engaged; and Messrs. Phelps and Howe, to support the popular Covent Garden plays.

English Opera House.—*Snap-Apple Night*, suggested by M^r Clise's splendid picture on that subject, has been produced here as a melodrama, and performed with great success after the first night, when very necessary retrenchments in the second act were suggested by the languor which attended its first representation. *Barny O'Bother*, "a relater of strange stories," is excellently played by Mr. T. Lee; and Mr. Brindal, Mr. Lyon, and Mrs. Ternan, fill up the other leading parts very effectively. The scenery and tableaux are particularly deserving of praise; and we are glad to see the house nightly filled to witness the various entertain-

ments, which are presented for the public gratification.

Strand Theatre.—*The Ballad Singer* has this week added Miss Betts and Mrs. W. West to the strength of the Strand company, and given a pleasant musical variety to the entertainments.

VARIETIES.

The Wellington Equestrian Statue.—We learn with great satisfaction that government has acquiesced in the decision of the late committee, and that there is now no longer the slightest obstacle to the prosecution of this interesting national work. The noble colossal head of Wellington, modelled by Mr. Wyatt, has met with the most unanimous approval and admiration: the likeness is fine and the character grandly preserved. With regard to this artist's execution of the horse, there can be but one anticipation, as no man living can do so much justice to that splendid animal in its true English form. The arch at Hyde Park will therefore be soon, we trust, crowned as it should be, with this national tribute to the hero of a hundred fights.

The Nelson Monument.—There is now a board up in Trafalgar Square, which encloses the excavations for trying the foundation of the Nelson column. It is as near as may be equidistant between the portion of the National Gallery and the statue of King Charles I. at Charing Cross; and in a direct line from the one to the other.

Curious Autograph.—A circular letter was sent, rather generally, some weeks ago, inviting a purchaser to buy "a letter written in 1801 by Mlle. de Beauharnais (afterwards Queen of Holland), which singularly contrasted with the high destinies afterwards attained by the Bonaparte family. In this letter, addressed to one of the friends of her infancy, the daughter-in-law of Napoleon solicits an invitation to a ball for seven members of this family which shortly afterwards were able to distribute crowns amongst themselves.

The Cambridge Camden Society, founded in May last, has commenced its operations by restoring to light the original Norman stem and perfect abacus of Coton Church. The removal of rubbish, and former church-warden embellishments, has opened up the ancient east Norman font; and elsewhere the view of ornaments of chevrons, and intersecting arches, curious though rude, will reward the trouble of an antiquarian pilgrimage. —[*Abridged from Cambridge Chronicle*].

King's College, London.—The Rev. Mr. J. H. Fish has given 1000*l.* to the funds of this institution; which, among other advances, is adding an hospital to its establishments.

Van Amburgh.—An elephant and two hyenas have been imported from America, for play-fellows for Van Amburgh. The former is a tame gentleman, already having travelled from the town of London seven years ago; perhaps he will favour the public with his tour in the United States, and his opinions of Yankee population and institutions.

Will's Whim.—No. I. Illustrated by Jacob Parallel (London, Berger), is one of the numerous class of imitations of which the illustrious Pickwick is the progenitor. The single number is rather introductory of the characters, and of course we cannot yet say any thing of the story, but that "there is no offence" in the way of telling it.

A Chronological Chart of the contemporary sovereigns of Europe (Hereford, J. N. Webb; London, Darton and Clark; Bath, C. A. Bart-

lett), is a very clear and useful historical analysis in a tabular form. It begins before the Christian era, and comes down to our time; setting out with the assertion that the name of *Great Britain* is derived from *Brill*, the Saxon appellation of the blue colour with which the natives stained their bodies. There is a note of remarkable persons in each period.

Cerona Amaryllidacea, by Miss Rosenberg, No. I. (Bath, C. A. Bartlett), is the commencement of a splendid representation of the numerous varieties of the Amaryllidæ tribe of plants. This fasciculus presents us with the *A. Sweetii* and the *A. Vittata Formosa*; the last is a beautiful hybrid, and truly called "one of the most charming varieties of Hippeastrum." The flowers are gorgeously coloured after nature.

Life of Napoleon, with 500 designs by Horace Vernet. Part I. Mr. Joseph Thomas has just commenced the publication of this life in half-crown parts. The narrative is brief, and the work seems to rely on the numerous illustrations, which are spiritedly cut in wood.

An inferior, or sixpenny edition of the same, Part I., has issued from the press of Mr. W. Strange.

Mrs. Loudon's Ladies' Flower-Garden. No. VIII. (W. Smith.) A rich and beautiful plate of lupins shews how worthy our old favourites are to rank with the fairest of novelties in the flower-garden. The Lathyrus, Lotus, Astragalus, and other sweet blossoms, also adorn this No.; and the third engraving is of a gay trio, Balsamina, Mirabilis Jalapa, and Impatiens Noli-me-tangere.

Gravitation a Force inseparably and universally associated with Matter.—Gravitation is fixed in matter eternally and inseparably. No lapse of time wears it away, no modification of circumstances in which it can be placed—no appliance of artificial means—or power of other natural forces upon it, removes or can remove the slightest conceivable portion of it. You may crush the parts of a body into a powder, apply to it the power of heat, and melt it into a liquid—or you may, by a yet intenser application of heat, dilate it into a gas; you may make of it a chemical solution; bring it again to its original form of a solid—analyse it again and again—combine and recombine it: through all these changes you will not in the slightest conceivable degree have affected the gravity or weight of any one of its particles. Not only is the power of gravitating thus unalterably infixed in matter, but it is infixed in it universally. There is no place on the earth's surface where there is matter and not weight—there is no matter known to exist in our system of the universe which does not gravitate; and if we carry on our inquiries beyond the limits of our system, into the fathomless depths of space, we find there the stars gravitating towards one another. It is a recent discovery of astronomy, that those multiple stars which, being examined by powerful telescopes, are seen to revolve round one another, and of which there are many, are in their motions subject to certain laws, which prove them to be attracted towards one another by the force of gravity—or rather by a force subject to the same laws as that which attracts all things on the surface of our earth towards its centre, and our earth itself towards the sun. Such is the eternal, immutable nature of gravitation, and such is its universality. Although the force of gravity thus coexists universally with matter, yet does it not reside in the same manner and degree in all matter; there is not, for instance, throughout all matter the same quantity of the principle of

gravitation (whatever it may be) associated with the same volume. Thus the component materials of the planets are such, that were they all of the same volume or size, they would not, nevertheless, all weigh the same. And it is scarcely possible to take up any two portions of the matter which composes the earth's surface, of which equal volumes would be found to have the same weight or gravitating power.

—*Moseley's Illustrations of Science.*

LITERARY NOVELTIES.

Mr. A. Asher, of Berlin, is preparing for publication an interesting collection of early documents relating to the Geography of the Middle Ages, edited by M. D'Avessac, of Paris, and Mr. Thomas Wright, of London. The volume will contain, among other things, the *Cosmographie Ethiope Philopoli*, said to have been reduced to its present form by St. Jerome, at the end of the fourth or beginning of the fifth century, and edited from numerous MSS., of which two are of the eighth century; a detailed and exact survey of the coasts of the Mediterranean sea, made apparently about the twelfth century, and peculiarly important for the geography of Northern Africa; several early inedited cosmographical treatises and itineraries, and a collection of facsimiles of early maps of the world, from manuscripts of the 10th, 11th, 12th, and 13th centuries. We repeat that this volume will throw much curious light on the history of geographical science and discovery. —*Foreign Monthly Review.*

The Sabbath.—"Sabbath Walks," by the Rev. James Grahame, Esq., we are glad to see, published by Messrs. Chambers of Edinburgh, in what is called the "People's Edition." Nothing can be better adapted for cultivating the morals and good feelings of the people. There is also a Memoir of the Author.

In the Press.

The Exiles of Zillertal; a Narrative of the recent Rise and Progress of Protestantism in the Tyrol, from the German of Dr. Rheinwald and other sources. — *The Colony of Western Australia.* A manual to men persons intending to emigrate to this Colony or its Dependencies, &c. &c., from authentic documents, by Nathaniel Cyle, Esq.

LIST OF NEW BOOKS.

Black's Picturesque Tourist of Scotland, with Maps and Views, 12mo. bound and gilt edges, 7*s.* — **Paley's Clergyman's Companion** in Visiting the Sick, new edition, 18mo. gilt edges, 5*s.* — **An Address to Medical and Surgical Pupils**, by James Barlow, 8vo. 3*s.* 6*d.* — **The Laws, Customs, &c., of the Island of Jersey**, with Notices of Guernsey, by A. Jones Le Cras, 18mo. 6*s.* — **Manchester as it is**, 18mo. 4*s.* — **Four Ways to Paris**, and Paris itself, 32mo. 1*s.* — **Memoir of the Rev. James Smith**, by George Pritchard, 8vo. 3*s.* — **Hebrew and English Dictionary**, by J. S. C. Frey, 8vo. 14*s.* — **Parents' Friend**, by John Morrison, D.D., 12mo. 3*s.* 6*d.* — **Traveller's Tables**, by Captain J. T. Boileau, royal 8vo. 8*s.* 6*d.* — **The Churches of London**, by George Godwin, plates, 2 vols. 8vo. 1*l.* 12*s.*; large paper, 2*l.* 2*s.* — **Guide to Italy**, by M. Valery, translated by C. E. Clifton, post 8vo. 16*s.* — **Claridge's Guide** down the Danube, 2d edition, 18mo. 8*s.* — **Maxims, Morals, and Golden Rules**, 8vo. 8*s.* — **The Cloud of Witnesses**; a Series of Discourses, by the Rev. James S. M. Anderson, Vol. I., 8vo. 10*s.* 6*d.* — **Shuttleworth's (Dr.) not Tradition**, but Scripture, 3d edition, 18mo. 4*s.* — **Confessions of a Thug**, by Captain M. Taylor, 3 vols. post 8vo. 1*l.* 11*s.* 6*d.* — **Philosophy of Common Sense**, 32mo. 2*s.* — **Jones's Book-Keeping**, Part I., (single entry), royal 8vo. 12*s.* — **Jones's Book-Keeping**, complete (single and double entry), 2*l.* — **Rev. W. Whewell's Bridgewater Treatise**, 8vo. 7th edition, 8*s.* 6*d.* — **Frank Howard's Science of Drawing**, Part II., Animals, 8vo. 8*s.* — **History and Topography of Ashbourne**. The Valley of the Dove, with Illustrations, 8vo. 11*s.*; large paper, 12*s.* — **Sketches of Missionary Travels in Egypt, Syria, West Africa, &c.**, by R. Maxwell Macbrair, post 8vo. 7*s.* 6*d.*

Wednesday 14	... 53 to 65	29.95 to 29.90

Prevailing Wind, S.W.

Except the afternoons of the 13th and 14th, generally clear; a little rain fell during the evening of the 11th.

Periodic Meteors. From nine in the evening, till nearly one hour after midnight of the 10th, the meteors were very numerous, though generally very small; eight of these were of more than ordinary brilliancy, and all followed by trains varying from 10° to 20° in length. The most remarkable fact was that nearly all appeared to proceed in one direction, viz. from N.N.E. to S.S.W. Rain fallen, .075 of an inch.

TO CORRESPONDENTS.

ERRATUM.—In "Caricatures," page 510, line 15 of the notice, for "caught" read "scolded."

ADVERTISEMENTS,

Connected with Literature and the Arts.

CLOSING OF THE PRESENT EXHIBITION.

BRITISH INSTITUTION,

FALL MALL.

The Gallery, with a Selection of Pictures by Ancient Masters of the Italian, Spanish, Flemish, Dutch, and French Schools, is open daily, from Ten in the Morning until Six in the Evening, and will be closed on Saturday, August the 24th.

Admission, 1s.

WILLIAM BARNARD, Keeper.

KING'S COLLEGE, LONDON.—The

Classes in the School will be Reopened on Tuesday, the 20th August next, at Nine o'Clock A.M. precisely.

July 1859.

J. LONSDALE, B.D. Principal.

No. 1. price 8d. stamped.

THE NEW SCIENTIFIC and LITERARY FAMILY NEWSPAPER.—Manufacturers, Mechanics, Patentes, Engineers, Agriculturists, Railway Proprietors, and all who are interested in Scientific Pursuits, should give immediate orders to their Booksellers and Newsmen, for "The Inventors' Advocate and Patentes' Recorder," a Weekly British and Foreign Miscellany of Inventions, Discoveries, and the Fine Arts. Price 8d. stamped, circulating free by Post. Communications are solicited.

N.B. This Paper combines, also, the leading Features of a Literary, Dramatic, and Fashionable Journal. London: Published for the Proprietors, by William Kidd, 7 Tavistock Street, Covent Garden; to whom Books, &c. for Review, and Advertisements, should be forwarded.

CHEMICAL and PHILOSOPHICAL APPARATUS.

7th edition, 12mo. price 1s. 6d.

A CATALOGUE of Chemical Mathematical, Magnetical, Optical, and Philosophical Apparatus and Instruments; the Metals, Earths, Ores and Minerals, Chemical Tests and Reagents; by GEORGE KNIGHT and SONS, Foster Lane, Cheapside, 1d. stamp. Manufacturers of every Description of Chemical and Philosophical Apparatus, Metallurgists, Ironmongers, and Dealers in all kinds of Mechanical Tools, Machines, and Materials. The Apparatus Classified and Priced, and Illustrated by upwards of Two Hundred Woodcuts.

BOOKS PUBLISHED THIS DAY.

With Woodcuts, fcap 8vo.

A SUMMER'S DAY at HAMPTON COURT;

being a Guide to the Palace and Gardens.

By EDWARD JESSE, Esq.

Author of "Gleanings in Natural History."

John Murray, Albemarle Street.

WORKS ON BOTANY.

By JOHN LINDLEY, Ph. D. F.R.S., L.S., &c.

Professor of Botany in the London University College, and in the Royal Institution.

Printed for Longman, Orme, and Co.

INTRODUCTION to BOTANY.

3d edition, with Corrections and numerous Additions, 1 large vol. 8vo. with Six Copperplates, and numerous Wood-engravings, 12s. 6d.

"We have no hesitation in pronouncing the 'Introduction to Botany,' by Dr. Lindley, to be the most valuable and perfect in any language we are acquainted with."—*Medical Gazette*.

SCHOOL BOTANY; or, an Explanation of the Characters of the principal Natural Classes and Orders of Plants belonging to the Flora of Europe, in the Botanical Classification of De Candolle. For the Use of the Students preparing for their Matriculation Examination in the University of London. Fcap. 8vo. with 126 Woodcuts, 6s. cloth, lettered.

A NATURAL SYSTEM of BOTANY. 3d edition, with numerous Additions and Corrections, and a complete List of Genera, with their Synonyms. 1 vol. 8vo. 18s. cloth.

SYNOPSIS of the BRITISH FLORA, arranged according to the Natural Orders. 2d edition, with numerous Additions, Corrections, and Improvements. 12mo. 16s. 6d. boards.

The Works which form the Standard Novels being the Copyright of Mr. Bentley, can only be procured in that Series, which is wholly unconnected with any other Collection of Novels whatever.

RICHARD BENTLEY, NEW BURLINGTON STREET,

Publisher in Ordinary to Her Majesty.

THE BRITISH EMPIRE IN THE EAST.

By COUNT BJORNSTJERNA, the Swedish Ambassador.

SIR ALEXANDER JOHNSTON, vice-president of the Royal Asiatic Society of Literature, and chairman of the Committee of Correspondence of that Society, being desirous, in consequence of the interest attached to every question relating to India, to ascertain, for the information of the members of the Society, the opinions which are entertained by the ablest and best-informed statesmen on the Continent of Europe, with respect to the present state of British India, has recently received, amongst others, from the Continent, a very able and impartial account of British India, written by his excellency Count Bjornstjerna, the Swedish ambassador at this court, who is a member, *ex officio*, of the Society. As the Count wrote his work in Swedish, he has sent Sir Alexander Johnston the following *résumé* of its contents in English, in order that he may make such use of it as he thinks proper; and having had the opportunity afforded us of making so interesting a document known to the public, we have felt it our duty, in consequence of the importance of the subject at the present moment, to print it entire, as evidence of the opinions which are entertained by well-informed foreigners upon a matter of such national concernment. The high rank the writer holds in his own country; the high diplomatic situation he fills in this country; his character for impartiality, and the manner in which he has been distinguished by his sovereign for his public conduct; the knowledge and talent he has displayed as an author on various financial and political subjects, must all render a work on the present state of India, from the pen of such a man, and at so critical a time, an object of the deepest interest on the Continent, as well as to the British Empire.

INTRODUCTION.

"Numberless are the revolutions of the universe; the creations, the destructions; He, the Almighty, produces them as in sport."—VEDAS.

"Such things, Though rare in time, are frequent in eternity."

BYRON'S CAIN.

Among the greatest phenomena in the history of the world may, undoubtedly, be reckoned the British Empire in the East Indies.*

This empire has, within a single century, risen from the humble rank of a trading factory to an *imperium* of more than 100,000,000 of inhabitants,† with an equal number (100,000,000) who, though under their own princes, still obey the British power.‡ It

* Strictly speaking in Hindostan and Deccan, which form the Indian peninsula's northern and southern parts; the former extending from the Indus and the Himalay mountains to the Nerbudda river; the latter from this river to Cape Comorin. We can certainly say the East Indies; but it is perhaps less decided, seeing that the eastern of the two great peninsulas of Asia (where the kingdoms of Ava, Pegu, Siam, and Cochin-China, are situated) is also included in the general name of the East Indies.

† The Presidency of Bengal contains	Inhabitants.
..... Agra ..	40,000,000
..... Madras ..	38,000,000
..... Bombay ..	15,000,000
.....	7,000,000

Total...100,000,000

‡ Montgomery Martin states, in his highly meritorious work on the British colonies, which is grounded on au-

extends over 1,250,000 *English square miles* of the most fertile part of the surface of the earth* (from 8° latitude to 35°, and from 68° longitude to 92°), and consequently contains a polar altitude the same as from *Messina* to *Torneo*, and a breadth as from *Lisbon* to *Smolensk*, which shews that it cannot be compared with any thing in Europe, either as to size or population, any more than in difference of climate and temperature, but that it must be compared with *Europe itself*. This empire has within its boundaries the *Gauts* and *Himalay* mountains always covered with ice, which rise, the former 13,000, the latter 27,000 feet above the level of the sea; it is intersected by rivers, each of which, like the Indus, Jumna, Sutledge, Ganges, and Brahmapootra,† offers a navigation of not less than 1200 *English miles*, and the two last-mentioned during certain months pour into the Bay of Bengal a mass of water containing more than 1,000,000,000 cubic feet in an hour.‡ It has for its defence a standing army excellently disciplined, and considerably greater than that of Austria,§ and a revenue half as large again as Russia.|| Within its boundaries there are towns which, like *Calcutta*, have a population of a million; others which, like *Delhi*, *Agra*, *Benares*, *Luckno*, and *Pooná*, reckon from 300,000 to 500,000 inhabitants; and others again—Ma-

thematic documents, that the number of the direct subjects of the Anglo-Indian kingdom amounts to 100,000,000 (see vol. I. page 169 of the edition printed 1835); and considers the subjects of those states which are more or less dependent on the Company, also to amount to 100,000,000. The latter, however, appears to me less likely to be correct, unless we reckon among the dependent princes several who yet consider themselves independent; among whom the king of Lahore, with 6,000,000, the princes in Bhotan, in Assam, the Amers in Sindh, &c.

The subjects, however, of the directly dependent and contingent subsidiary princes amount to more than 50,000,000.

* See Parliamentary Reports for 1831.

† According to the latest accounts of the source of these great rivers of India, viz. Moorcroft's (published 1838), Burnes's (1835), Gerard's (1834), and Jacquemont's (1837). It is partly on the Thibet table-land (which lies 17,000 feet above the surface of the sea), partly from the great lake Mansourvur, also situated there, and also from the Rakorom mountains to the north of the lake. The four first-mentioned rivers, after having, in several directions, wandered over the above-named table-land, cross the double chain of the Himalay mountains through four different passes, or dales, which themselves lie 15 or 16,000 feet above the surface of the sea. On this height Dr. Gerard has found great beds of mussels, and other shell-fish; as also nackers, and a kind before unknown, called *unishites*: they were found in a bed of broken granite, limestone, and clay. The river Brahmapootra takes a south-east direction from the territories of Thibet, and goes round the whole of the Himalays, in order, together with the Ganges, to throw itself into the Bay of Bengal.

‡ According to calculations made by Burnes, during his highly interesting travels up the Indus (1831), this river discharges 80,000 cubic feet of water in a second, during the day season, which is four times as much as the Ganges at that time, and answers to the discharge of the Mississippi.

§ The Austrian army is at most 280,000 men; the Anglo-Indian, with its contingent troops, 250,000; a few years since, during the Birman war, it was 350,000; but we shall return to this subject further on.

|| The revenue of Russia, according to the latest accounts, is 300,000,000 rubles, answering nearly to 12,000,000*l.*; the revenue of British India amounts to more than 19,000,000*l.* yearly.

Presidency.	Revenue.
Bengal and Agra	£11,800,000
Madras	4,700,000
Bombay	2,200,000
Ceylon	420,000
Diverse	56,000

Total...£19,176,000

dras and Bombay, which carry on a trade greater than that of ancient *Carthage*, *Venice*, or *Genoa*, during their most flourishing periods. It has kings as vassals, with a greater number of subjects than Naples;* of dynasties older than the Bourbons; and the emperor in Hindoostan, the descendant of Tamerlane (Thimur Khan), the great Moghul, sits still on his golden throne, in Delhi, surrounded by all the grandeur of the East, himself only a prisoner in the power of the British.†

But who then is the conqueror, who the ruler, of this immense empire, over which the sun extends so gloriously his glittering rays, that has risen on the continent of Asia as by enchantment, and now emulates in greatness that of Alexander, Tamerlane, or Nadir Shah?

Why, on a little island, in another part of the world, in a narrow street, where the rays of the sun are seldom able to penetrate the thick smoke, a company of peaceable merchants meet; these are the conquerors of India, these the despotic rulers of this splendid empire.

We seek in vain through the annals of the world for any thing that can be compared with this, or be compared with the rapidity with which this power raised itself from nothing to its present colossal height. Rome required ten centuries to reach its loftiest point, the British power in India has risen almost equally high in less than one; but still more remarkable does the rise of this power appear, when it is considered that it is not indebted for its advancement, like that of the *Tartars* in *China*, to superiority of armies, nor like that of the Goths and Vandals in Western Europe, to the effect of immense masses of people overwhelming others; nor as the Arabs in Asia when the fanaticism of religion wielded the sword; nor has it risen from the same reason as the *Spaniards* in *America*, where the simple people took the followers of Pizarro for *Centaur*s, and the fire from their arms for the lightning of heaven.

No, to no such cause is it indebted; we see here a small number of Britons, first, by means of a few well-understood mercantile attempts, gain accession to the distant country, so spread themselves, so establish their counting-houses, so, with the Roman device as their example, *divide et impera*, separate and rule kings and princes of India, conquer them, and with the most trifling means, within the short period of sixty years,‡ found one of the mightiest empires of which history gives any example; inhabited by a warlike people, among whom the *Mahrattas* alone were in possession of an army of more than 200,000 men, organised by French officers, and supplied with a numerous artillery.

* The king of Oude has 6,000,000; Nizam, in Hyderabad, 10,000,000 of subjects.

† Among the numerous pensioned princes we will only mention here,

	Silver rupees.*
The Nabob in Bengal, with a yearly pension of	2,500,000
The Nabob in Carnatic	2,000,000
The Emperor of Delhi	1,600,000
The Rajan of Tanjore	1,200,000
The Rajan of Benares	500,000
Tippo Saib's son	600,000

‡ Bengal, the first English territorial possession, was not gained before 1776.

Each rupee is worth about half-a-crown.

It is to this remarkable circumstance, viz. the smallness of the means used, compared with the greatness of the object gained, that the author wishes particularly to direct the attention of the reader; seeing that it contains proofs of the superiority of European civilisation over the half-cultivation of the East; of the advantages of the intellectual powers over the material, and of the way gained by science over ignorance.

India with its Sanscrit, so expressive for metaphysical conceptions, with its ingenious philosophical systems, from which Plato himself, Socrates, and Aristoteles, have gleaned; with its mystic religious doctrines, from which dogmas seem to have propagated themselves to the most distant quarters of the world; with its poetical spirit and its rich mythology, presents an object, speaking as loudly to the reflection of the philosopher, as to the investigation of the man of science.

The oldest records we possess concerning this country, are from the time of Alexander's march, and the accounts his followers brought with them to Greece. These could only be in the highest degree uncertain, seeing that the Greeks were ignorant of the language of the country; that one generally views the powers and means of defence possessed by an unconquered enemy as if through a magnifying-glass; and also because Alexander did not extend his conquest further than to the *Hyphasis*, now called the Sutledge, and consequently only to the northernmost province of India, the present kingdom of Lahore.

Alexander, who had succeeded, with great difficulty, in passing the *Hydaspes*, now called the *Jelum*, in sight of a numerous hostile army, pressed forward, after having conquered Porus, the king of the country, to the *Hydrastes*, and finally to the *Hyphasis*, the last of the five great rivers which fall from the Himalay mountains down upon the plains of India, in order finally to unite with the *Indus*. At the *Hyphasis*, Alexander was met by the king of the Gangarides, Agrames, who, with a force of 20,000 horse, 200,000 foot, and 2000 war-chariots,* opposed the progress of the Greek, till then uninterrupted in his course, from victory to victory; revolt broke out in the army: Alexander returned to the *Hydaspes*, built vessels there, went down the stream to the *Indus*, and along it to the Indian Ocean, whence he returned along the Persian Gulf to his conquered provinces in Media.

The resistance the Indian kings made on this occasion, the power of their armies, the number of their war-chariots, the excellence of their arms and appointments, and the strength of their fortresses, the besieging of which had nearly cost Alexander his life, prove what India was even at that time. This is testified also by Herodotus, Diodorus, and Arrianus, the first authors that gave to Europe any detailed accounts of this country. The most complete are, however, by *Megasthenes*, who had gone as ambassador from Alexander to some Indian princes, probably those of *Oude* and *Bahar*. Diodorus and Arrianus mention the high state of cultivation India had then reached, that it was filled with large and rich towns, carried on a considerable trade, and had roads with milestones, and buildings for the accommodation of travellers.

Strabo and *Plutarch* also agree in these statements.

A long period passed after the above-named authors, during which no accounts were re-

* See Arrianus, and Quintus Curtius, c. ii. b. 8.

ceived from India. Some few fathers of the church, St. Clemens and St. Ambrosius, for instance, made some observations; but of so uncertain a nature, that but little dependence could be placed in them.

After these *Marco Paolo* is, perhaps, the best source for a knowledge of India at that time, and in some respects is a very remarkable writer; but even he speaks of so many monstrous things, that one can place but little confidence in him.

The account of a journey by Ibn Batuta is in all respects more worthy of attention. He was from Tangier in Morocco, and in the year 1324 (750 of Hedschira) undertook a journey to the East, which was not finished before 1353, and had consequently lasted twenty-nine years. Batuta, who was a learned and a pious man, visited during his wanderings, Algiers, Tunis, and Tripolis, Egypt, Syria, Arabia, Persia, Khorassan, Afghanistan, India twice, Thibet, China, Sumatra, Java, and returned by Ormus, Schiras, Ispahan, Aleppo, Mecca, Jerusalem, and Gibraltar, to Morocco; an amazing journey for that period.

During his sojourn in India, Batuta gained the favour of Mahomet, the emperor of Delhi, who sent him with an embassy to the emperor of China. Mahomet was descended from the sultans of Khorassan, who had conquered India. The whole dynasty of these sultans had the surname of *Oddin*, a circumstance which the author considered it right to notice here.

Batuta's embassy, which consisted of not less than 1000 persons, departed from Delhi 1342, and an account of some of the presents that were taken with them may give an idea of the magnificence which prevailed at the court of Delhi. They consisted of a hundred Arabian horses, richly harnessed; a hundred Bajaders, distinguished for their beauty; five dresses, ornamented with jewels; 500 ditto of gold and silk; 1000 ditto of different kinds of stuffs; vessels of gold, swords set with jewels, &c. &c.* The description of Batuta's journey contains, however, but little for the man of science, it being principally on account of his numerous adventures, with little more than a list of the names of those places which he visited. It is written in *Arabic*, and extracts were first translated by Rosegarten, and afterwards the whole work by Samuel Lee, of Cambridge.

The above-mentioned trifling information is all with which the middle ages present us respecting India. But a new era soon commenced for entering upon a study of it. *Vasco di Gama* had discovered the way round the Cape of Good Hope; the Portuguese founded the settlement of Goa (about 1600). Their missionaries, soon followed by the Jesuits of the Roman propaganda, penetrated into the country, and our sources of knowledge respecting the East now became more abundant. Among these, the Jesuit *Du Halde* has left the most complete, founded, however, on the reports of the Hindus themselves; but as these are given without any critical examination, they do not possess that value which they otherwise would have.

After the Jesuit, there appeared two Frenchmen, to whom we are indebted for the best accounts of India; *Bernier* and *Tavernier*. The former travelled there from 1640 till 1646, during the reign of the Moghul, *Shah Jehan*, father of the renowned *Aureng Zeb*.

Tavernier travelled somewhat later; but

* The embassy was first plundered on the road, and afterwards suffered shipwreck. Batuta himself, however, finally arrived in China by way of Thibet.

neither of these authors possessed a knowledge of the Oriental languages: the latter, indeed, had not received a general education.

Anquetil and *Herbelot* ("Bibliothèque Orientale") certainly possess merit as learned authors; but as their opinions are built upon the missionaries' reports alone, they are less sure, and are now also out of date.

Gentil's "*Voyage dans les Mers des Indes*" (1660), and Bailly's "*Traité sur l'Astronomie Indienne*," are more to be depended on.

At the same time that Bailly wrote* (1780), the antiquity of India, together with its religion and philosophy, were treated on, with a view which was far from praiseworthy, by the French *Encyclopédistes*,† with *Voltaire* at their head. This remarkable man, whose bold glance, however, never penetrated beyond the surface of any subject, and who wished to refer every thing to a system formed beforehand, endeavoured to avail himself of the doctrines of the Brahmins, in order to injure those that were more holy; and often distorted the missionaries' accounts, for the sake of raising doubts on subjects which ought not to be doubted.

Two other authors followed the same course, — *Volney* and *Dupuis*; the former in his work called "*Les Ruines*;" the latter in his "*Sur l'Origine de tous les Cultes*;" they seem, however, with the appearance of profundity, to have been completely mistaken in their conclusions.

It was reserved for the English to arrive first at more correct views, and at a more perfect knowledge of India; and who could be in a more advantageous position for the purpose than that people who govern India? The way was opened (1787) by Sir William Jones, first president of the learned Asiatic Society in Calcutta.

With extensive learning, as well European as Oriental, and a perfect knowledge of Sanscrit, Persian, Arabian, and Hindostanee, Sir William united the advantage of many years' residence in India; his works are consequently of the greatest value.‡

After him, *Colebrook* claims our attention for his great knowledge of India, especially with regard to its religion and philosophy; in the history, *Mill* is the best; in other branches, *Crawford*, § *Houghton*, || *Tod*, ¶ but especially General Sir John Malcolm, ** and the late governor in Bombay, *Elphinstone*, †† are the best authors to consult; while, with regard to the monuments of India, *Lord Valentia* is the first authority. ‡‡

§ "*Hesperus Idee über die Politik, den Verkehr und Handel der alten Welt*," is really grounded on the Arabic sources above mentioned; the same is the case with that very meritorious work which a learned countryman (Professor Palmblad) has published (1832), and which, under the modest title of "*Handbokki Geografica*" (Manual of Geography), is a source which supplies an extensive knowledge of India.

Protection.—What Advantage does England derive from its Power over India?—What Effect has this Power on India?—What Prospect is there of the Stability of this Power? 1. With regard to its inward State. 2. With regard to its outward; and those hostile Expeditions that could be made against it.—Final Reflections.

What advantage does England derive from its power over India?

Three most important questions now spontaneously present themselves, namely:—

1st. *What advantage does England derive from its power over India?*

2d. *What effect has this power on India?*

3d. *What prospect of stability has this power?*

The explanation of these questions is so much the more important, as it forms the *really practical result* which is here to be sought. We shall therefore consider them separately.

1st. *What advantage does England derive from its power over India?*

The policy of the English parliament, in the government of its extensive colonies, has long been, and still is, *not to take from them any direct revenue*, either in the form of a tax or otherwise; but to seek its advantage only in the profits of trade, the sale of its productions, and in other *indirect revenues*. It is especially of this enlightened and wise policy that England is indebted for the gigantic increase and flourishing state of her colonies, which latter forms the real condition for their remaining under the English sceptre.

This policy is built on the *soundest principles* of political economy, namely those which teach that the people's gain is that of the crown; that riches do not consist of gold and silver alone (which Spain sought in America, but did not find, even in the mines of Peru), that riches consist in exchange, in sale, in trade; that the profits herein are mutual, enriching the countries that participate in it, not one at the expense of the other. These principles are not new in England, they were employed at a time when America, now the United States, formed a British colony. These States had never paid a single farthing towards the support of the government in the mother-country, and the only advantage the latter derived was the *indirect gain* arising from the sale of its manufactures, and the fortunate enterprises of private individuals.

Whereas England had given to North America all those political institutions which have the foundation for its personal strength and freedom; given it the advantages of a representative constitution, of a commercial government, a jury, freedom of the press, religious freedom, and of personal liberty (Habeas corpus, &c.). These advantages could not, however, in the opinion of the Americans, balance the tax of a few pence imposed, and considered unjustly, on tea and paper; a circumstance which would carry the appearance of ingratitude, if a people, when arrived at that stage in their social education which is necessary for independence, did not do the same as a son who has attained the age of manhood,—emancipate himself, and leave the quiet for the raging storms of the world: such is human nature: so also will the Hindu act, as he has gained that degree of enlightenment which forms the maturity of society.

I hasten to return to the subject,—the *policy of England's colonial government*.

England will not take any revenue from immense colonies, nothing that can lighten English people's own heavy burden of taxes, but then, it may be reasonably asked, can the advantage to the mother-country from colonies?

With regard to India, it consists in the following sources of revenue:—

1st. In that profit which arises in England from the expenses which the East India Company there defray, and for which the means are taken from the East Indies, these are:—

Interest (at 104 per cent.) on the shareholders' original capital, 6,000,000 a-year	£615,000
Travelling expenses from and to India, for its military and civil officers (at an average)	66,000
Freights for English ship-owners	134,000
The commanders' salaries during their half-yearly sojourn in England	120,000
Compensation to the English war department, for the clothing, fitting out, and arming with articles of English manufacture, of the royal troops serving in India	220,000
Pensions for military officers now living in England, but formerly in the Company's service in India	60,000
Ditto for civil officers	30,000
Salaries for the East India Company's servants in England, and the maintenance of its buildings, &c.	100,000
Remuneration to the Board of Control, &c.	30,000
Cadet schools in England	22,000
Bounty money in England	44,000

Transport.... £1,443,000

Purchase of materials in England, for the clothing, arming, and fitting out of the native East India army 500,000 || Sundries | 37,000 |

2d. In those savings which the trading, or serving English, living in the East Indies make, which are considered to amount yearly to a medium of

1,500,000

3d. In that gain in trade which private individuals make in the East Indies (especially by the sale there of English manufactures), which is reckoned to amount yearly to....

3,000,000

Total gain.... £6,500,000

Hence we find, that England's gain from its East India possessions amounts to no less than 6,500,000 pounds sterling a-year; a sum which would, in the end, completely ruin this colony (or, more properly speaking, drain it of its bullion), if it were remitted in this form. But such is not the case; it comes to England in the following manner:—East Indian opium is sent to China, and is there exchanged for tea; this is taken to England, and covers all the exchange.

Such are the *phenomena of trade*:—what the one country gains is not lost by the other: they both gain.

It is, however, from a higher point of view than the preceding, that the colonies of England ought to be considered.

On what does Britain ground her political power, if not on her colonies? which include a greater portion of the globe than Russia itself (the English colonies take up a sixth part of the land on our globe, Russia a seventh part), and especially a more populous, better cultivated, and a richer territory than that empire.

On what does Britain ground her naval power, if not on her colonies? where trade and communication employ hundreds of thousands of her seamen (England has, according to the latest statistical accounts, the surprising number of 700,000 seamen in *active service*, of course principally mercantile).

On what did Britain, in her strife for life or death against the power of Napoleon, ground her prospect of leaving the field with the palm of victory, if not on her colonies? which, after all the harbours in Europe were shut against her flag, offered in theirs a market, an exchange, a trade, which supported its decaying strength, and alone made victory possible!

Of these colonies India is, without doubt, the first; it is so not only in a political and commercial point of view, but, considered philanthropically; for England distributes there the benefits of civilisation to more than 100,000,000 of our fellow-creatures; and will probably, at some future period, succeed in supporting it,

on the purest of all foundations—the mild and exalted doctrines of revealed religion.

2d. *What effect has the power of England on India?*

Having elsewhere examined the advantages which England enjoys from her power over India, we should now glance at the effect this power has on India.

It will be necessary, for this purpose, to go back to the state of this country before its conquest by the English, by which means alone the question can be decided as to its relative condition *now*, compared with *formerly*; its positive condition shall be examined afterwards.

In order to proceed as impartially as possible in the first of these inquiries, I will, in the description of the state in which India was immediately before the English conquest, when it was principally under the sceptre of Mahomedan Mongols, refer to the authority of a Mahomedan writer. This author, the most faithful of modern historians, is Golaim Hoessein Khan. He thus describes the state of India in the eighteenth century:—

“At this time,” he says (in his “History of Hindostan”), “all prisoners of war were murdered; all suspected persons were put to the torture; the punishments were empaling, scourging, &c. The people in certain provinces were hunted with dogs like wild beasts, and shot for sport. The property of such as possessed anything was confiscated, themselves strangled; no one was allowed to invite another to his house without a written permission from the vizier or rahya of the place where he lived; and the people were constantly exposed to the most dreadful plunderings and outrages.” Such was the situation of Hindostan during the latter part of the dominion of the great Moghuls: it became still worse when Nadir Shah, like a torrent of fire, overwhelmed the country; and was perhaps most unhappy when, after the departure of Nadir, India was left in the power of the Mahrattas, whose only object was plunder, burning, and devastation. Hindostan then presented a picture of such unheard-of oppression, that one shudders at the description. Thousands of examples may be found in the history of these times, of the whole population of conquered towns being murdered by the conquerors. Delhi, which then possessed more than 1,000,000 of inhabitants, became quite desolate after Nadir Shah's massacre, which he continued seven days without intermission. Shah Abdahla, Nadir's successor on the Persian throne, also left it to the pillage of his outrageous soldiery (1761); and it fell a third time a sacrifice (1767) to the power of the Mahrattas, who murdered all that could not save themselves by flight.

India had been destroyed, however, not only by foreign conquerors, but also by the tyranny of its own princes, who, assisted by the anarchical state of the country, no longer knew any bounds to their cruelty. It would be both too tedious and too disgusting to give instances of this, for the eruptions of despotism are every where the same, though they take a still more dreadful form in those countries where the perpendicular rays of the sun cause the blood to flow more rapidly; where a continued despotism has created a slavish submission; and where with his bleeding victim, the surest means of reconciling the despot—the mild religion of Christ—does not exist. This state of misery and destruction, of anarchy and civil war, of foreign and domestic violence, which has spread its black veil over the land of India, just at the time when England appeared on its political theatre, doubtless assisted much in that coun-

try's unexampled success; England presented itself to the Hindu people in the character of their friend, their protector, not in the form of a new oppressor, a *Tamerlane*, a *Nadir Shah*, a *Saladin*. Its army did not, like those of the Moghuls, Persians, and Mahrattas, press forward plundering and laying waste wherever they appeared; no, it united European civilisation with European discipline, was orderly and humane in its conduct, paid for all that it took, protected the humble, and saved the conquered from the revenge of the conqueror. It is thus, especially, that the giant strides, made by the British arms in Asia, may be accounted for.

Having given, from an indubitable source, a picture of the state of India, under the Muselman power, we should now take one representing its condition under that of the Christian British; for this purpose we shall choose those sources which are most to be depended on: among which, in the first place, the worthy Bishop Heber,* whose letters deserve so much the more to be depended on, as they were not intended for publication, but were written under the seal of confidence to some friends in England.

"There are," says Bishop Heber,† (in a letter dated 16th December, 1823,) "now in Calcutta and the surrounding villages, twenty boys' schools, containing from sixty to one hundred and twenty each; and twenty-three girls', each of twenty-five or thirty." The children learn, it seems, to read and write both the Bengal and English languages, the *morals* of the Christian religion, arithmetic, geography, and history. This is the more astonishing with regard to the girls, as no female in Bengal was allowed, two years ago, to learn either to read or write."

In another letter, to Sir Wilmot Horton, Bishop Heber writes:—

"Some of the best-informed of their nation (Hindu), with whom I have conversed, assure me, that the half of most of their remarkable customs of civil and domestic life are borrowed from the Mahomedan conquerors; and at present there is an obvious and increasing disposition to imitate the English in every thing. The wealthy nations now all affect to have their houses decorated with Corinthian pillars, and filled with English furniture. They drive the best horses and the most dashing carriages in Calcutta. Many of them speak English fluently, and are tolerably read in English literature. In the Bengalee newspapers,‡ of which there are two or three, politics are canvassed with a bias, as I am told, inclining to Whiggism. Among the lower orders the same feeling shews itself beneficially, in a growing neglect of *caste*, in not merely a readiness, but an anxiety, to send their children to our schools, and a desire to learn and speak English, which, if properly encouraged, might, I verily believe, in fifty years' time, make our language what the Oordoo, or court and camp language of the country (the Hindoostanee), is at present; and though instances of actual conversion to Christianity are, as yet, very uncommon, yet the number of children, both male and female, who

are now receiving a sort of Christian education, reading the New Testament; repeating the Lord's Prayer and the commandments, and all with the consent, or at least without the censure, of their parents or spiritual guides, have increased, during the last two years, to an amount which astonishes the old European residents, who were used to tremble at the name of a missionary, and shrink from the common duties of Christianity, lest they should give offence to their heathen neighbours. So far from that being a consequence of the zeal which has been lately shewn, many of the Brahmins themselves express admiration of the morality of the Gospel, and profess to entertain a better opinion of the English, since they have found that they too have a religion and a saviour. All that seems necessary for the best effects to follow it, is to let things take their course, to make the missionaries discreet, to keep the government as it now is, strictly neutral, and to place our confidence in a general diffusion of knowledge, and in making ourselves really useful to the temporal as well as spiritual interests of the people among whom we live."

In a letter dated January 27th, 1824, Bishop Heber says, "Their crops are magnificent, and the soil, though much of it has been in constant cultivation beyond the reach of history, continues of matchless fertility. Nowhere, perhaps, in the world, is food obtained in so much abundance, and with apparently so little labour. Few peasants work more than five or six hours in a day, and half their days are Hindoo festivals, when they will not work at all."

The female dress consists only of a piece of cotton, wound about the waste like the ancient Greeks; but even the *lowest classes* use, both in the country and in towns, ornaments of gold and silver on their arms, ankles, and fingers, and in their ears, which are of greater value than the smartest dress of any servant girl in England.

Bishop Heber gives the following character of the Hindus (see his letter of the 7th June, 1825):—

"The different nations which I have seen in India have, of course, in a greater or less degree, the vices which must be expected to attend an arbitrary government, a demoralising and absurd religion, and (in all the independent states, and in some of the districts which are partially subject to the British,) a laxity of law, and an almost universal prevalence of intestine feuds and habits of plunder. Their general character, however, has much which is extremely pleasing to me; they are brave, courteous, intelligent, and most eager after knowledge and improvement, with a remarkable talent for the sciences of geometry, astronomy, &c., as well as for the arts of painting and sculpture."

Montgomery Martin's work on India gives a more general view of the advancement of education in India, than can be obtained from Bishop Heber's letters. It contains (page 404) a table which states the number of schools in Madras alone at 12,498, with nearly 20,000 children from six to fifteen years of age.

Although there are no special reports on the number of schools in the other governments in India, the best-informed men (among them Montgomery Martin) say, that education has made as great advancement there as in the government of Madras. This has led to the remarkable result, that the proportion between the persons that can read and write, and those that cannot, is greater in India than in any country in Europe.

According to Montgomery Martin, see page 412, this is the proportion:—

In India	1 in 5
In Russia	1 in 7
In the Netherlands	1 in 9
In the United States of America	1 in 11
In England	1 in 15
In Austria	1 in 15
In France	1 in 17

This surprising result has been produced in India within the course of twenty years, and shews what a government can do, if it have the power, ability, and the wish to be useful.

Colleges are now to be seen in all the larger towns in British India; the age of the students is from 15 to 25 years. At these establishments, the Hindu youths are educated partly in the languages of Europe; the English is most admired. Shakspeare is a favourite author there as in England, and his plays are performed with great success by the Hindu youth.

The British government has taken great pains to render the relation between the lower and higher castes easier for the former. They are now perfectly equal in the eye of the law; the only equality that can reasonably be expected in any country.

The British government has abolished human sacrifices, which still existed on their first arrival on the continent of India; has abolished the custom, then prevalent in certain provinces (especially Raypootana), of killing those *female children* that exceeded the number of 2 or 3 in a family; and it has abolished (during the time that Lord William Bentinck was governor-general) the barbarous custom of burning the widows (*suttees*).*

The British government has, in a great measure, abolished the dreadful scenes witnessed in the Jagernaut idolatry; and the number of those is now small who throw themselves under the wheels of the image, there to be crushed to death. More, however, remains to be done in this respect, especially by forbidding the sending out of preachers to encourage the people to undertake pilgrimages, the dreadful troubles and difficulties attending which cost the lives of several thousand persons yearly.

Besides these great advantages, the British government has bestowed upon its subjects in India the most important palladium of constitutional society, the *liberty of the press*; it has given them, the (free citizens) glorious right of being judged only by their equals in a jury, and preserves conscientiously the most perfect religious freedom. When to all these blessings we add the orderly and just progress of the administration of the law, the flourishing state of trade, the peace which now generally prevails over this extensive territory (instead of the anarchy and civil war which before prevailed), and, what is most important, the *sacredness of the right of property and of personal freedom*,—it must be allowed that these circumstances, not only *relatively* to the state of India before the arrival of the British (of which Golaim Hussein Khan gives so striking a description), but even *positively* forms a very pleasing picture. The philanthropist can, therefore, only praise that heavenly providence which has spread these blessings among the millions of India, and honour that nation which, by the wisdom of its government, has been the noble instrument.

(To be continued.)

REVIEW OF NEW BOOKS.

Morton of Morton's Hope. An Autobiography. 3 vols. 12mo. London, 1839. Colburn.

THIS is, we believe, the production of an American author, who has chosen to make his

* This is still done sometimes in secret; but if discovered, all who were present are punished.

* Protestant Bishop in Calcutta, from 1823 to 1826, when he fell a victim to the difficulties of the uncommon journey he had undertaken in his diocese—the whole of India.

† Since 1823, when this was written, the number of schools has more than doubled itself.

‡ The Bayadars are an exception: they receive in this respect, a much better education in the temple than the rest of their sex, which contributes, in a considerable degree, to increase the great influence and real respect which they enjoy in India.

§ There are now fourteen newspapers in Calcutta, which also proves the increasing inclination for European culture.

début in this country. His own will have no need to be ashamed of him, for the work is one of great talent, variety, and spirit. We might add, of thought and originality; though the latter is not a little derived from the very desultory nature of the incidents, and the appearance and disappearance of many of the characters, who figure for a space and then leave the field to others. This is very lifelike, and not very like the construction of a fiction, where all parties are bound together by the skill of the writer, carried through certain adventures, and finally brought to a *dénouement* which embraces the fates of the whole body.

Morton of Morton's Hope begins his career somewhat near the middle of last century, in the house of an eccentric uncle, a few miles from Boston, Massachusetts. His earlier scenes are acted there; and then he travels to Germany, where the chief portion of the narrative relates to his intimacies, loves, and manifold affairs with students, donnas, and curious personages of every description. He then returns to America, takes part in the revolutionary war, mixes much with the Indians (having a cross of their blood in his veins), and in the end is settled down a distinguished and powerful citizen.

As there is no danger of our letting out any secret connected with the story, we shall copy a few extracts which, we think, cannot fail to recommend the matter and the spirit of our new and welcome literary friend. The hero's Aunt Fortitude, and Uncle Joshua, are good portraits. The former was a great genealogist, but he says:—

"The information I derived from her was, after all, of no great value. It seems pretty certain, however, that the Mortons had always an unlucky facility for getting on the wrong side. In Cromwell's time they were said to have been staunch cavaliers, and so forfeited half their estate; and just as the tide was turning, they seemed to have turned too, and so lost the other. The roundhead gentleman of one generation soured into a puritan in the next. The puritan dwindled into a dissenter, and the dissenting clergyman, after having in vain endeavoured to learn Dutch, and smoke meerschaums with the congregationalists of Leyden, finally shipped himself for America, and landed in the merry month of November on the genial shores of Newfoundland. Fortunately the climate proved even too severe for the frigid constitution of the nonconformist—for if my respectable ancestor had not thought proper to remove to a trifling distance from the arctic regions, where he first landed, it is probable that his descendant would have been a white bear by this time, instead of the compiler of this pleasing autobiography."

The uncle is thus painted:—

"My uncle Joshua had been bred a merchant. He had been, however, engaged in trade but a few years, and with indifferent success. When my grandfather died, Joshua and my father were the only surviving children; and as the latter, by his erratic course of life, and various and sundry misdemeanours, which at present I shall only hint at, was no great favourite with any one: it was considered highly reasonable by every body, but the person most interested, that the scapegrace should be disinherited, and the bulk of my steady old grandfather's fortune go to his eldest son, Joshua. Joshua of course left trade. His disposition and tastes were literary and scientific. He had received a tolerable education for the provinces, and he now took himself off to the Old World to complete it. He re-

mained many years in England and upon the Continent; cultivating the arts and sciences, pursuing various whimsical schemes from one time to another, and in short leading much the same sort of life, which an indolent man of easy fortune and respectable talents is apt to lead, in any age or country. He returned to his native province a few years before my birth, resolutely repulsed all advances of matrimonial alliances from the most distinguished colonial families, the deputy governor's and innumerable members of the council among the number; built himself a huge castle of pine-planks and shingles, which he dignified with the title of Morton's Hope, and there shut himself up with his schemes and oddities. He had been disappointed in an early passion, and had become shy of women. He had had two sisters, Miss Plentiful Morton, who had married a schoolmaster from Passamaquoddy, and died about a year before his return, leaving an enormous progeny, every one of whom he religiously hated; and Miss Fortitude Morton, who had remained in single blessedness, and whom he now took with him to the Hope, as his housekeeper. My aunt, Forty, was the genealogical relative whom I have spoken of in the first chapter. As for myself, I shall not now relate the singular course of events which made me the third inmate of the Hope; suffice for the present, that I was adopted by my uncle at a very early age. It would be very difficult for me to sketch the character of my uncle, and on the whole I shall not attempt it. It seems to me that every one must have known him, and to explain his character seems to be like explaining any one of the natural phenomena, which we assume as being known instinctively by every one. A few of his leading characteristics may be, however, traced in as many lines. He was a bundle of contradictions, or rather he was through life possessed with the desire of preaching what he never once thought of practising. He was the most kind-hearted man in the world, and he invariably talked like an ascetic; he was idle, self-indulgent, luxurious, and would talk to you by the hour, of the necessity of industry, comment on his mercantile career, and recommend Spartan diet, and penitentiary soup, when you knew he ransacked the country for luxuries for his table. He was indelibly charitable, but always railed against the pernicious practice of alms-giving, and would praise what he called the dignified police of the ancient nations, who gave the poor and the aged to the dogs, instead of locking them up in hospitals. I have known him bully a pauper who asked an alms, and made a speech to him, on the necessity of industry, till the beggar was fairly worried out of his patience, and have then seen him sneak back to give him five times as much as any one else would have done, out of pure soft-heartedness. In short he made amends as he thought for doing just what he chose, and allowing every body under his charge almost every kind of indulgence, by preaching the most rigid and ascetic doctrines. If you heard him praise a person, you might have been sure that he was the very reverse of himself in every particular; if you heard him recommend any line of conduct, or praise any particular doctrine, you would be sure that he would act exactly contrary in every respect. If you heard him animadvert on any sort of extravagance, he was certain not to rest till he had been guilty of it himself. It may be easily inferred that in regard to all matters touching my education and management, he was likely to be absurdly rigid in theory, and as ridiculously indulgent in practice. I may add to all this, that my uncle's

head was contantly full of some scheme or some 'theory' (to use a favourite phrase of his own), which occupied most of his attention for a short time, and then was thrown aside for ever. Sometimes they were good, sometimes preposterous, and sometimes indifferent; but they were always thrown aside for others before they had time to ripen."

We give a future anecdote of him:—

"I had not walked far, when I perceived a small cavalcade making its way to the Hope. Joshua attired in a brown wrapper, and furred boots, an India handkerchief round his neck, and a bear-skin cap on his head, led the procession, mounted on the reader's acquaintance, Sleepy Solomon. Mayflower and Deane riding side by side, completed the party. Joshua, as the servant told me, had taken it into his wise head to give a fête, in honour of his own birthday. The festivities were to conclude with a ball and illumination, and he had brought from town a quantity of squibs and Congreve rockets for the occasion. He was a singular figure, as he jolted up and down upon the gigantic horse. His wrapper, with one yawning pocket filled to the brim with the fire-works that were to explode that evening, and the other stuffed with a brown-paper parcel of passion-flowers, which he had purchased to make Mafy a wreath with, flapped heavily against his horse's flanks. Under his arm he clutched a bundle of flannel petticoats, purchased in town for Aunt Fortitude, and with one hand he jerked testily his horse's head at every tormenting jolt, while in the other fluttered the newspaper, which, with his spectacles bobbing down to the tip of his nose at every step, he was most preposterously endeavouring to read aloud for the edification of the lovers. 'It is a favourite theory of mine,' said he, turning back towards his auditors with a sublime countenance, 'that one should accustom oneself to do as many things at a time as possible. Caesar, you know, could read, write, and dictate to a dozen all at once,—&c. &c. all at once;—and you see that I, without pretending to be as great a man as Caesar, can rein a restive horse, carry as many bundles as a baggage-wagon, and read these proceedings of the General Court, all at once, while each of you have enough to do to keep your seats on your horses.' Just as he concluded this vain-glorious speech, his horse stumbled heavily in a rut. Joshua, pulling awkwardly at the bridle with one hand, flapped the paper in his eyes with the other. The horse, resenting this insult, kicked up his heels, and Joshua, alarmed, dropped newspaper, bundles, and all, and clung to Solomon's neck with both hands. Upon this, I advanced from a thicket, picked up the bundles, and greeted Joshua, who had already tumbled from his horse, with surprise at my unexpected apparition."

On a heavy love-disappointment the hero attempts suicide, and affords us an opportunity of giving an extract of a different kind:—

"I now determined to shoot myself. This conclusion was perfectly natural. I mounted my horse, and rode hastily to Morton's Hope. I went to my room, took my pistols a second time, and walked quietly into the wood. I sat down on a fragment of rock, took off my cravat, unbuttoned my waistcoat, laid bare my bosom, and placed against it the muzzle of the pistol. So far all was simple enough. I, however, now made the discovery that killing oneself is the easiest matter in the world, till you come to the final particulars. I found these very troublesome. With a desperate effort, however, I drowned reflection, and pulled

the trigger. The pistol flashed in the pan. I sank upon the ground in a state of wonder at my miraculous escape. A moment after, I began to reflect: I began to think myself a lucky fellow, at being so well out of the scrape. I believe, that in that minute, and a portion of a second, which intervened between the pulling of the trigger and the trifling explosion of the pan, I had run over all the thousand arguments against the propriety of the measure; in that infinitesimal portion of time, I had seen unrolled before me all the thousand charms, and delights, and realities of life, just as it was too late, and my unhappiness and its causes shrank up into nonentity. Conceive of my delight, in finding myself alive after all. 'A year ago,' said I to myself, 'I wandered through these woods; I dreamed of a future of glory and of joy; the sun-light lay warm and beautiful on the path of my life; my way was strewn with roses; the heavens were bright, the earth was green; the flowers were gay, the birds sang merrily on every tree. My heart was full of happiness and hope; I had not then seen May-flower, I dreamed not of her existence; yet was my present happy, my future glorious. Can the sun shine no more? Are the woods no longer green? Do the flowers no longer bloom? Have the birds forgot to sing? Have I no longer a green world to rove through? Must the gates of the future be barred upon me, because I may not dwell in her arms? Thrice-sadden ass! if she sighs for your death, you will not hear; if she weeps, you will not kiss away her tears; if she dies, you will not be near her in the grave. Buffoon! can you not feel that her grief, if grief she feel, will pass from her heart, like a breath from a mirror, and leave no trace. Look beyond,—one year,—half-year,—three months,—and lo! she is laughing, and dancing, and singing,—and you have hardly rotted in your grave. Try time,—try time: in one little year the arrow will drop from the wound, and our heart will be whole. In one little year you would stand over the grave of such a love-sick child as your former self, and laugh his memory to scorn. Try time,—try time! Why this haste?—why this unseemly haste? If, when you have essayed Time's healing balsam, you find that the worm decays not, if your purpose is still unchanged, will there be then no more gunpowder, no more poison, no more halts, in the world? Away, then, with this unseemly haste.' I went through a long series of such pleasing reflections: but, I dare say, I have given the substance of them. Boys and girls shoot themselves sometimes in a pet, but it is only men who do the thing deliberately and systematically. I was not yet a man; my love of life, and my fear of death, were both great; it was this that scared me, as it has hundreds, from voluntary death. My deliberation weakened and destroyed my resolve, so I put my pistols into my pocket, and walked quietly into the house. It will be seen, but I hope, pardoned for the present, that my nature, at this period, was utterly void of any thing like morality, or even regulation."

Our author finds Congreve rockets fifty years before they were invented. But we must end with another example:—

"His dress was exceedingly neat, contrary to the habits of most students, and his frill was exquisitely plaited. He advanced towards me, shook me warmly by the hand, and we were soon engaged in earnest conversation. He discussed all sorts of topics, but his principal themes were music and anatomy. When he found that my intention had been directed of late to the

natural sciences, he seemed delighted, and became very communicative. A servant presently announced that supper was ready. 'I have invited no company to meet you, Mr. Morton,' said he, 'because I wished that we should make each other's acquaintance first; and secondly, because till I knew you I could not tell what sort of people you would suit and would be suited to you.' I testified my gratification at our being alone. He gave me his arm, and we were proceeding to the supper-room. 'Stay, stay,' said he; 'I had forgotten my duty to my own family.—I have not introduced you, I believe, to my grandfather?' 'Is it possible,' thought I, 'that this sexagenarian can have a grandfather? But these Germans are so long-lived.' 'But will he not sup with us?' said I aloud. 'Ha, ha, ha—very good—very good!' chuckled the baron, 'very excellent! No, no—I am afraid we shall hardly induce him; and, so saying, he suddenly opened the door of a small mahogany cabinet. 'Mr. Morton, Baron Kiniski: Baron Kiniski, Mr. Morton.' It was a stuffed man! For an instant I was staggered; but recovering my self-possession, and wishing to please the humorist, I made a low obeisance, and assured the old gentleman I was charmed to make his acquaintance. It was the skin of a man of middle stature, the features admirably well preserved, with glass eyes, and stuffed exactly after the manner of wild beasts in a museum. He had apparently died when a little advanced in years. The hair and beard were a sable silvered, and both were nicely combed. I had sometimes seen such exhibitions in anatomical collections. 'But why do you dignify him with your grandfather's title?' 'Because he is my grandfather!' said he coolly. 'And how came he into his present enviable position?' 'Position!—his position is a very good one. This is an excellent and very handsome cabinet. I call him my cabinet minister—very good—ha, ha, ha!' 'Very good indeed,' said I; 'but pray do you think he would have been satisfied with his situation if he had been consulted on the subject?' 'Consulted! why he selected it for himself. You must know,' continued he, 'that the Kiniskis have been, for several generations, great lovers of science, and withal great humorists. My grandfather, the gentleman in the glass case, was a profound student of anatomy. Just before his death, having a small independent property to leave, (apart from the family estate, which descended to my father, and subsequently to my eldest brother,) he summoned his grandchildren to his bed-side. It happened that there were but two boys among them, my cousin Herman Kiniski and myself. 'I have a small estate, sufficient to support a moderate man,' said he; 'I am desirous of leaving it to one of you two. Had you rather,' he continued, addressing himself to Herman,—'had you rather that I should bequeath to you my body (which, by the way, must be always preserved and kept in the family of him who inherits it) or my estate?' 'God forbid,' cried the booby Herman, 'that my grandfather's body should be deprived of Christian burial, and a worthy monument by the side of his ancestors!' 'In other words,' said the old gentleman, 'you would prefer the estate. And you, Caspar?' he continued, turning to me. Now, I had already become imbued with many of my grandfather's whims, or absurdities (if you choose to call them so), and, moreover, I suspected that he intended to favour me; so I answered boldly,—'God forbid that I should hesitate for an instant between two such unequal offers; I take the body. God forbid, too,

that so distinguished a votary of science as my grandfather should be doomed to a vulgar burial like common individuals.' 'It is well,' said my grandfather; 'my body is yours, Caspar.' 'And the estate?' eagerly demanded Herman. But my grandfather had sunk back exhausted. The next day he revived a little, and the next day he was able to sit up and be dressed. On the third, he was sitting in his arm-chair, in his dressing-gown and slippers, and every body thought he was fairly recovering, when he suddenly fell back and expired. I believe, from my soul, that he did it on purpose; the eccentric old gentleman could not bear to do any thing like other people, and I have no doubt he was inwardly chuckling, at the last gasp, at having given us the slip so cleverly. The will was opened—no mention was found of the estate in question; but, by a codicil, his body, and the clothes that he last wore, were bequeathed to me. I claimed the body as a matter of course. It was delivered to me. On putting my hand into the pocket of the dressing-gown which he wore when he died, I discovered a package of papers. One of them was a letter. It was directed to me. I hastily opened it. First, without any preface, it contained a long list of instructions for pickling and flaying human bodies, together with directions for stuffing and embalming them. He urged upon me strongly the necessity of setting about my task immediately. After I got to the end of all this, I discovered a very important postscript. It was simply a devise (in consideration of his great affection for me, and particularly of his approbation of the love for science and for his person which I had displayed in my late choice,) to me and my heirs of the whole estate in question. The other papers were the title-deeds, &c., of the estate. 'And you accepted the whole, of course?' said I. 'To be sure!' said he. 'I became independent for life. I skinned and stuffed my grandfather immediately, and then set off on my travels.'"

The Indian portion of the volume is very powerfully written; but we can cordially recommend the whole.

IRELAND.

1. *Letters from Ireland, M.DCCC.XXXVII.* By Charlotte Elizabeth. London, 1838. Seeley and Burnside.
2. *Guide through Ireland, Descriptive of its Scenery, Towns, Seats, Antiquities, &c., with various Statistical Tables; also an Outline of its Mineral Structure, and a brief View of its Botany.* By James Fraser. Dublin, 1838. Curry and Co.
3. *Map of Ireland*, published under the Superintendence of the Society for the Diffusion of Useful Knowledge.
4. *A History of Ireland from the Relief of Londonderry in 1689, to the Surrender of Limerick in 1691.* By the Rev. John Graham, M.A., Rector of Tamaght-Ard. Dublin, 1839. Curry and Co.
5. *Chronicle of the Law Officers of Ireland.* By Constantine J. Smyth, B.A., of Lincoln's Inn. London, 1839. Butterworth.
6. *A Tour in Connaught, comprising Sketches of Clonmaenise, Joyce Country, and Achill.* By the Author of "Sketches in Ireland." Dublin, 1839. Curry and Co.
7. *An Account of the extraordinary Cures, Conversions, and singular Favours conferred on Persons wearing the Medal struck in Honour of the Immaculate Conception: translated from the French.* Second Edition. Dublin, 1838. Powell.

8. *A Novena in Honour of the Immaculate Conception of the Blessed Virgin, with an Account of the Origin and Effects of the Miraculous Medal, translated from the French; to which are prefixed, Observations on Devotion to the Blessed Virgin and the Saints.* Sixth Edition with Additions. Dublin, 1838. Powell.

9. *Rambles in the South of Ireland during the Year 1838.* By Lady Chatterton. 2 vols. Second Edition. London, 1839. Saunders and Otley.

THE good taste, good feeling, and good sense, which Lady Chatterton's volumes exhibit, have rapidly placed them in a second edition, which recalls our attention to several Irish books that for some months past we have allowed to accumulate upon our table. Indeed we cannot help feeling a disinclination to peruse works concerning that extraordinary country, for reasons which we have stated in the *Literary Gazette*, No. 365, so far back as the 17th January, 1824, and which we may, therefore, be excused for repeating:—"So seldom do we take up a book on the subject of Ireland which does not tire us with tedious statistics, or offend us by political bitterness, or disappoint us by repeating the same everlasting themes of national prejudices and foolery."

It appears to us, that Ireland is divided into two parties, the Roman Catholic party and the Protestant party, who respectively watch the movements of the other with almost incredible jealousy. If a bit of orange riband is worn by an individual, it is regarded as a triumph to the Protestant religion; and the imprudent wearer is denounced in the same spirit that formerly would have led to his martyrdom at the stake. If, on the other hand, a peasant does not doff his hat, it is a sure sign with the Protestant party, that their lives and property will be the inevitable sacrifice to the schemes of an arrogant priesthood. This ridiculous exaggeration embitters all social intercourse in Ireland; and yet in England, when, as we have very recently met, an Irish Roman Catholic priest and an unflinching champion of the Protestant religion, and even of Orange or ultra Tory principles, at the same board, they did not spring at one another like tigers; they did not, as might have been expected, had the meeting taken place on the other side of the Channel, seize on carving-knives and use them as daggers. No: on the contrary, there seemed to be no point of disagreement between them; they both condemned the violence of party spirit, and regretted various misrepresentations on both sides, and that they never had an opportunity of meeting on easy terms in Ireland, although they had been for years near neighbours. We remember one of the parties quoting an epigram by a Doctor De la Cour, an Irish poet, as, indeed, is evident from his rhyme:

"Should Tom and I be angry through mistake,
Or wrong conjecture, let us meet and *spoke*;
For one may be as causelessly accused
As 't' other is designedly abused:
The world is such, 'tis difficult to know
If the most seeming friends be friends or foe."

And, at the conclusion of this remarkable meeting, we can assure our readers, that when the Roman Catholic priest (as pleasant, though not quite so clever a fellow, as Father Proust himself,) and the avowed champion of the reformed religion parted and shook each other cordially by the hand, there was no need to cut a hole in the door for the performance of this ceremony, as is said to have been done in Dublin upon the reconciliation of two Irish peers, each fearing to be poniarded by the other.

The last lines of Dr. De la Cour's epigram appear to sum up our opinion of the writings of Charlotte Elizabeth relative to Ireland. We admire the enthusiasm of Charlotte Elizabeth, and we are entire believers in her sincerity and honesty of purpose, but here our praise must end. In our view, her writings have done much mischief to Ireland; for they have done much to sustain the violent prejudices that exist in some Protestant minds against Irish priests and Irish Roman Catholics. Charlotte Elizabeth urges impartial inquiry into the real state of Ireland; and yet, in the letters before us, all her conclusions, which of course she fancies to be impartial, are derived from excursions in the counties of Wexford, Wicklow, Westmeath, Down, Armagh, Londonderry, and Donegal; that is, entirely the north or Protestant district of Ireland, with the exception of Wicklow and Wexford, in the latter of which counties the rebellion of 1798 has raised feelings and prejudices which forty years have not sufficed to remove.

However impartially drawn the deductions from this tour may be, they cannot, we assert, be fairly applicable to Ireland. "Root and branch," to use an Irish phrase, Charlotte Elizabeth denounces the Roman Catholic priesthood; and why?—because Father Murphy, Father Roche, Father Redmond, and Father Kavanagh, were found in the ranks of the insurgents in 1798, and she happens to be at Wexford. "So long as the Romish hierarchy and priesthood retain the essential character of their class, they will stand prepared to wield the whole moral and physical force of their boasted millions against us." Again:—"I have passed some years in the south of Ireland, and that too in very troublous times, yet I never witnessed a lack of respectful courtesy on the part of the poor peasant towards the gentry. It seems, however, that an order has lately been issued by their priests in some of these districts forbidding the usual recognition of a superior, should he happen to be a Protestant; and this, of course, is obeyed: but at what expense of feeling to many of the poor people, their looks betray, as they steal past with a mortified air, or strut by with one of assumed bravado. The present policy of their leaders is to superadd contempt to their long-cherished hatred of the Saxons; while flattering them that the land will, ere long, be again their own, and their cherished superstition, the established, the exclusive religion."

It was Archbishop Bonlter, we believe, who said of his efforts to educate the Irish people, "Unable to make them good Protestants, I am willing to make them good Catholics; in short, good any thing." But Charlotte Elizabeth is not of the archbishop's rational mode of thinking: she will have education precisely according to her own views, which certainly are none of the most tolerant. "Many a delightful hour," she writes, "have I passed in schools conducted under the different plans that, however varying in detail, all met in one common centre—and that centre the Holy Bible. Now, if I see a Romish chapel, I look in its immediate vicinity—within the very precincts of its boundary, for some new spruce building, bearing the inscription, 'National School'; and what is the system of instruction adopted there? The Bible is excluded; a mutilated extract, unfaithful even in its mutilations, is substituted nominally: but even that is scarcely ever used; while all the debasing fables of monkish superstition, all the contaminating licentiousness of the lowest class of immoral and indecent publications, are placed in the hands of the poor

children; and, in a multitude of instances, the person appointed to the office of master is a furious zealot in popery and sedition. These, you will say, are strong statements."—Yes, we do say, that there are pretty strong statements, which make us hesitate a little about Charlotte Elizabeth's boasted impartiality. But before we proceed to shew the enthusiastic champion-ship which is to be found in almost every page of this volume, we will quote the Orange version of Moore's "Minstrel Boy," whose devotion to the cause in which he was engaged induced him, instead of tearing the chords of his harp asunder, to jump through the parchment of his drum; an instrument, not quite so poetical, nor as action by any means so graceful.

"We had passed into Wicklow, but sad recollections continued to attach themselves to the locality. A dreadful and disastrous battle was fought here during the Rebellion; one incident of which you must have, because I am persuaded that the touching anecdote gave rise to a song that we have both admired. You remember

'The minstrel boy to the war is gone;'

but I doubt whether you have heard its probable origin. In the engagement that here took place, between the king's troops and the rebels, the latter were victorious. Among their prisoners was a little drummer, named Hunter, twelve years of age, who fell into their hands. They told him he should still carry his drum, and beat it for them on the march; but the intrepid child, filled with loyal devotion, exclaimed, 'Never! The drum that has sounded in the king's service shall never be beaten for rebels!' And instantly leaping upon it, he burst it completely through. Must I add the sequel? the heroic little fellow was directly put to death, perforated with pikes. Mr. Moore visited this spot; he could not but know the tale, which is recorded in the annals of the Rebellion. It was worthy of the author of 'Captain Rock' to steal this trophy from the brow of loyalty, and with a little of his own brilliant colouring superadded, to place it on that of something very different. The minstrel boy, who, to prevent the desecration of his harp, 'tore its chords asunder,' was evidently fighting on the other side. Poor little Hunter lost the wreath of poetic fame, by being true to his king; but we, at least, shall not again fall in with 'The Minstrel Boy,' without recollecting the youthful drummer at Gorey."

In the passage-boat from Dublin to Mullingar, Charlotte Elizabeth thus describes her travelling equipments:—"I had in the portmanteau at my feet, a great folio of Foxe's 'Actes and Monuments'; in my pocket, Dr. Newland's cutting *exposé* of the 'Anti-superstition Education Board'; and on my lap, the plants that I had brought from the top of Vinegar Hill." As she proceeds towards "the black north," Charlotte Elizabeth enters more and more into the spirit of the popular song, the burden of which is

"Put your trust in God, my boys, and
Keep your powder dry."

Arrived within the walls of Derry, she is presented by her host with "a valuable gift, the half of a cannon-ball, found fast-wedged in the walls of an old house, taken down a few years since, where it had been lodged and broken by coming in contact with some yet harder substance. I could not but think, when contemplating this memento, of the promise, 'No weapon that is formed against thee shall prosper!' It was remarkably fulfilled during

the siege, and while I live I shall treasure the broken missile of a baffled foe. At eleven o'clock we repaired to the cathedral, where service is celebrated on Wednesday and Friday mornings; and thither I went with joyful feet, *carrying the cannon-ball in my handkerchief*, that I might be the more stirred up to bless the Lord, and not to forget His benefits."

And thus proceeds Charlotte Elizabeth, until she declares her wish to head a crusade against popery, and to issue forth from the gates of Derry, sword in hand, to cut down priests and priestcraft.

"Yesterday I sallied through Butcher's Gate in quest of a relic, but did not go far; that quarter called the Bogside is the counterpart of our London St. Giles's, and inhabited by a most uncivilised population. I did not explore it, but learnt much from others concerning it. Oh! how I longed for time and opportunity to make a *regular sally* through that gate into the enemy's camp, *after the fashion of 1689*, armed with the sword of the Spirit, and seconded by a determined party of Irish Scripture readers."

On the day of her departure from Londonderry, this George Walker in petticoats receives a deputation of the 'prentice boys—her "kind brother 'prentices."

Need we go further? If correct views, impartial statements, and calm observation, are desirable respecting Ireland, we can assure our readers that they need not look for them in the *Letters of Charlotte Elizabeth*. Our continued observations on the Irish books, placed at the head of this article, we must reserve until next week.

A Paper:—of Tobacco; treating of the Rise, Progress, Pleasures, and Advantages, of Smoking; with Anecdotes, &c. By Joseph Fume. 12mo. pp. 165. London, 1839. Chapman and Hall.

TOBACCO, as a source of revenue, may well succeed to our notice after the *Tea*-total affair, from Dr. Sigmond, which illustrated our No. 1177. In no other way can we afford it similar countenance; for we look upon it as being as unnecessary as the latter is now necessary, as nasty as the latter is cleanly, as offensive as the latter is innocuous. A more disagreeable nuisance than a young shopboy smoking a cigar does not infest the streets of London. An Irish market-woman, or a hodman with a dudheen, is tolerable; but to see the whelps, who make the air noisome almost wherever you go in and about the metropolis, is, indeed, an offence of mental and physical bile to the beholder.

Their faces are generally of a lightish dun, smoke colour; their mouths, pursed up like monkeys munching soft apples; their eyes, bleary and dissipated; their nostrils, as it were, disgusted with their mouths, and having a nightman twist and expression; their air, most impertinent; and their whole Puppy, at once ridiculous and provocative to kicking. We do not mention their continual and filthy squirts of expectoration, as they take the stinking roll of weeds from their dirty lips, and tip off the burnt ashes with an amusing consequence, and staring about with a vacant stolidity; for, really, the picture is altogether so revolting, that even its grotesque absurdity fails to excite the laugh of contempt; and we cannot but pity the poor creatures, with their snivelling, turnip-built countenances, whilst we are annoyed by their apish practices.

Mr. Joseph Fume (which pronounced quickly sounds very like Mr. Joseph Hume) is, we pre-

sume, an assumed name; and we are the more confirmed in this suspicion by not knowing any family so called, or being able to find it in the Directory or Red Book! But, be the writer who he may, and with all our objections to the subject, the little volume is an amusing one, and contains much popular information about tobacco; a few indelicacies are the only drawback we have to allege against Mr. Fume's performance. He sets out with an account of the origin and introduction, derivation and appellation, of the production in question, stating (from Oviedo's "*Historia General de las Indias*," edit. 1535) that "it appears that tabaco was the name given by the Indians to the tube with which they used to inhale the smoke, and that certain persons erroneously supposed that this was the name of the herb, or of the stupor consequent on the Indian mode of using it. From the light afforded by Oviedo, it is not difficult to trace the different meanings of the word: the expression *tomar tabaco*,—literally, 'to take a pipe,'—was used to signify the practice of smoking; and subsequently the name tabaco was transferred from the tube or pipe to the herb. The tobacco plant was known by several names to the native inhabitants of America. In Mexico it was called *piecalt*; in Brazil, *petun*; in Hispaniola, *coliba*; and in other islands, *yoli*. The potato, which we also owe to America, was not so generally known in the New World, when it was first explored by Europeans, as tobacco: the natives of Mexico and the Antilles were accustomed to smoke the 'fascinating weed' long before they were acquainted with the use of the 'prolific root.' The Indians of the continent, as well as those of Hispaniola, esteemed tobacco as a 'sacred thing.'"

And it is added:—

"It may be worth while to remark here, that the Pythia, or priestess of Apollo at Delphi, was inspired, or excited to a state of frenzy, by a vapour, before she delivered her oracular responses. Both Indians and Greeks, it seems, required to be stupified before they could receive a knowledge of future events."

This, we think, completely proves how uncalled for the practice is in England; for, our Boeotians being already the stupidest of created animals, not excepting superannuated donkeys, it is a work of extreme supererogation in them to swallow tobacco vapour to increase their stupidity; and as for imparting to them a glimpse of futurity, the sottish-looking drivellers are not able to comprehend what they are about at the time present, when they are bedouding themselves with puffs of inodorous fumigation.

But, independently of the folly and uselessness of smoking in our climate and with our habits, there is a still more serious consideration attached to the excess to which it is carried, and especially by the young in various employments, and by the poorer classes of the people. It is an expensive indulgence; and an honest shopboy, an apprentice to a trade, an ill-paid attorney's clerk, and multitudes in many similar walks of life, cannot afford it. The two or three cigars a-day, not to speak of their attendant tippling, are a heavy cost to such persons; and we firmly believe that a large proportion of the minor crimes committed in London and other populous places, owe their perpetration to the paltry exhibition of smoking. Thieving, robbing masters, breaches of trust, petty swindling, discontent, lying, idling, keeping bad company, resorting to demoralising haunts, are all the notorious fruits of this per-

nicious habit; and the cells of Clerkenwell, Horsemonger Lane, Cold Bath Fields, and Newgate, contain hundreds of ruined witnesses to the truth of our statement, that most evil propensities and most guilty results have begun in procuring means to purchase the daily dose of tobacco, or of the deleterious stuff manufactured and sold under that name. Even Chartism, in many the offspring of poverty and discontentedness, may be traced, in a considerable degree, to this original cause.

But we shall quit grave reasoning, and return to our author. After giving a good historical notice of the olden times of Raleigh, &c. &c. he tells us:—

"The great plague in London, 1665, tended materially to confirm and extend the custom of smoking among the citizens, in consequence of certain doctors having asserted that the use of tobacco was good against the infection. It was also currently reported that the families of tobaccoists had generally escaped the contagion. Tobacco might now be said to have been made free of the city: at the annual dinners of the different companies it was indispensable; and there is reason to believe that pipes and tobacco were served at lord mayors' feasts.* Unfortunately no artist has transmitted to us a view of the interior of Guildhall, with five hundred citizens 'all alive and smoking,' on the evening of lord mayor's day."

In the polite mayoralty of Lord Wilson, how we may rejoice that wheresoever else the contagion has spread, it has been banished from the Mansion-house, the Guildhall, and the city barges and cutters. There is one green spot (not green fat of turtle spot) for recreation where the odious stench of tobacco is not allowed to intrude. In the city, not far from *Spittlefields*, and near to *Smoke Alley*, true gentility has taken up its abode; and the chief magistrate will hardly permit north-country coals, far less Orinoco, to be burnt within the bounds of his sovereignty. He feels that manners make the man; and the very apparel of our respectable resident citizens shews that they are not of the flash class (those, the city flash class, generally reside out of town, and are sad objects in their "bang-up" orbits) who, if they cannot lard the lean earth, at least can poison the pure air, and are thus described:—

"Gentlemen [Gentlemen!!], whether civil or military, who wear moustaches, are nearly all cigar-smokers; and it has been ascertained by a painstaking member of the Statistical Society, that out of every ten gentlemen who wear Macintoshes, nine, on an average, smoke cigars. Shipping-clerks, custom-house agents, and Mincing-lane brokers, are great consumers of tobacco in this form."

Moustaches, which may be bought at from fourpence to half-a-crown a pair, in the little barbers' back shops in back streets; blouses, cheap and nasty, shapeless and sheepstealing in outward appearance; dirty hair and hands, the worst appurtenances of the tribe of Benjamin; and cigars polluting the circumambient atmosphere, are indeed the characteristics of these would-be *gentlemen*! Only look at "the critters;" the last pilfered sixpence, perhaps, thus consuming: truly tobacco may in such instances be called "the anodyne of poverty;" and this might be some excuse for it, were it not also too frequently the cause as well as the cure, and the anodyne of thievery more than of beggary.

* "You are sensible that children smoke more nowadays than even soldiers and carmen did heretofore; and that more of this nasty stuff is spent at a beastly city feast than would have served the whole kingdom formerly."—*The Reasons of Mr. Bay's changing his Religion*.

"Shame (says our author) on those who would harshly deprive the hard-working labourer of this indulgence! Sleek, well-fed, capon-rumped Quakers, who know not what toil is, are in particular opposed to the 'idle and wasteful habit' of smoking and chewing, so much indulged in by the poor. Let such over-fed, over-righteous 'Friends,' take for a while the place of some of our hard-working fellow-countrymen, and at eve, when their bones are aching with toil, and their minds incapable of exertion through bodily fatigue, let them, if they can, find solace 'in the inward light of the Spirit.' Let Obadiah take a few days' exercise at ploughing, mowing, or reaping; breaking stones on the highway, or steel at Sheffield; at coal-heaving on the Thames, or ballast-casting on the Tyne; let him serve the bricklayers for a month, or turn stoker to a steam-boat for the same period; do a foremast-man's duty in a voyage to Archangel or Quebec; and, when he has tried any of these, he perhaps will be able to estimate the value of tobacco, in diminishing the sense of weariness, and of enabling the working man to go quietly to bed without wishing that 'chaos were come again.' Were 'Friends' practically acquainted with the beneficial effects of smoking, in checking incipient mental disease, it is probable that the Retreat, near York, would not contain so many inmates; for, notwithstanding the much-vaunted excellences of the Quaker mode of life, proportionably more persons of this sect become insane than of any other denomination of Christians in the United Kingdom."

What the Society of Friends have done to provoke this diatribe we know not; but we do know that they are about the cleanest class of people, both in person and dress, which can be found in Great Britain. And, perhaps, they may think with us, that a wholesome penny roll and a glass of sound beer would be better for "the hard-working labourer" than the whiff of a noxious, stupifying weed, destitute of nourishment and sustenance; or that a pound of juicy mutton was worth more to the poor than half a dozen pipes of short-cut or even a real (*i.e.* imposition) Havannah cigar! But Mr. Fume has stronger reasons to urge in favour of short cut. "There is not (he declares) an instance on record of a person, however suicidal his thoughts might be when filling his pipe, proceeding to carry his intentions into effect immediately after he had smoked it out." Oh! wonderful discovery, if true, though how ascertained we cannot surmise; that if you contemplate cutting your wizzard all the time you are replenishing your "yard of clay" with shag, if you only take time to smoke it out, away flies your shagrine; instead of stopping your breath, you resolve at all risks to puff on; and as for separating your windpipe, you look forward to nothing so much as treating it with the companionship of a few pipes of tobacco every day, till your body is dried up and your fire is extinguished. Therefore be it granted, as the best argument in the case, that whilst you are smoking *pig-tail*, you are not likely to be committing suicide!!

Come we now, however, to statistics:—

"In the United States, with a population of about 16,000,000 souls, Nigger, Yankee, and Indian, the annual consumption of tobacco is about 108,000,000 pounds, which is at the rate of nearly seven pounds for every man, woman, and child." No time for self-murder among them! And Mr. Fume gets sentimental:—

"A pipe of tobacco, or a cigar, after a day's hard exercise, whether mental or bodily, and after the cravings of hunger and thirst are

appeased, may be fairly ranked amongst the most delightful and most harmless of all earthly luxuries. It fills the mind with pleasing visions, and the heart with kindly feelings. A hard-working labourer, smoking by the side of his hearth at night, presents a perfect picture of quiet enjoyment. I see him now in my mind's eye. He is seated in an old, high-backed, cushionless arm-chair; but an easy one, nevertheless, to him who, from dawn till sunset, has been engaged in ploughing, threshing, ditching, or mowing. With one leg thrown over the other he quietly reclines backward, and with an expression of perfect mental composure, he gazes on the smoke that ascends from his pipe. There is a sentiment-exciting power in the smoke of tobacco when perceived by the eye, as well as a pleasing, sedative effect when inhaled; and those smokers who have any doubt of the fact should take a pipe with their eyes closed."

What a picture of rustic felicity, the hard, high-backed, easy chair; the leg crossed over, the sweet reclining as he eyes his pipe and does not pipe his eye! One of the embellishments represents this happy English labourer closing his peepers in the most doltish indifference, neither quite asleep nor quite awake, his dog is at his feet longing for a whiff, his wife is washing something in a hand-basin, and looking at him with unutterable tenderness—the softened Juno of this cloud-compelling Jove—and the fire is burning bright, and there is an air of comfort about the whole apartment which seems to say, 'I can well afford to smoke myself and to smoke bacon.' Would it were so in the cottage of every hedger, ditcher, thresher, reaper, and mower in the country! But alas! it is but a bottle of smoke. And if we were content to admit the harmless pipe at home, is that any reason why we should be suffocated with it in the crowded streets, be pestered with it on coaches and in steamers, and not even be able to enjoy a stroll in a sweet pastoral grove or lane without having the wholesome freshness destroyed by some of these locomotive human engines who are nuisances wherever they go? Not so in the opinion of our author, who declares—

"There is nothing like a cigar for whiling away the tedium of travelling; to my fancy a real Havannah never smokes so pleasantly as on a coach-top, or the deck of a ship, more particularly towards evening, when odours are most powerful, and the mind, perchance excited by the 'dying day's decay,' reverts most forcibly to the thoughts of absent friends."

Nevertheless he adds—

"Tailors' trotters, young medical students, 'walking the hospitals' till duly licensed to kill, haunters of low billiard-rooms and sixpenny hells, raffish swaggerers in saloons, and pawn-brokers' shopmen, are generally fond of smoking their cigars in the street: not, indeed, from any pleasure which it affords them, but from an opinion that it gives them a 'buckish air.' The sight of a slim, tallow-faced, young man, with a dirty shirt and a pair of drills to match, looking as if he were about to puke when he takes his cigar out of his mouth to spit, as he struts along Piccadilly or the Strand, is almost enough to excite the risible muscles of a cabman's horse, and to act sympathetically as an emetic on the stomach of a decent Christian. In foggy weather, between eleven at night and two in the morning, a gentleman returning from the theatre or a social party may smoke a cigar without committing any breach of good manners."

Thus he goes on to excuse the sins he is inclined to by doing those he has no mind to.

"The man who considers such a state of mind

as an enjoyment, and who knowingly tries to induce it by continued smoking, may be justly denominated a tobacco sot, whether he wears a big-wig, or a pair of patched corduroy smalls. When the custom of smoking is indulged in to such an extent as to prevent a man from efficiently discharging his duties, instead of being an innocent recreation, it becomes a detestable vice. The man who cannot restrain his passion for tobacco even for half a day, but must have his pipe wherever he goes, though the smoke may be offensive to the majority of the company to whom he is introduced, is a positive nuisance to society. The proper place for such a person to enjoy himself in would be a tap-room in Wapping, where smoking is allowed at all hours of the day."

And then the posthumous smell, the stale stench of the next morning on clothes and person, enough to make a hog sick—these are among the pleasurable essences of tobacco-smoking, with which the smoker affronts all decent society. And we may now copy the account of the various kinds of tobacco with which our iale is blessed, not to mention the many vile substitutes which are sold for them.

(To be continued.)

Physic and Physicians: a Medical Sketch-Book, exhibiting the Public and Private Life of the most celebrated Medical Men of former Days; with Memoirs of Eminent living London Physicians and Surgeons. 2 vols. 12mo. London, 1839. Longman and Co.

THERE is no class of writing whatever in which it is so difficult to be accurate as in biography. No care can guard against mistakes and misrepresentations; and the utmost that can be done by great pains, industry, and research, is to avoid error and elicit truth as much as possible. The title of "Sketch-Book" is so unpretending that we look for little more in the present instance than a compilation from the sources of "former days;" and, with regard to the living, that sort of amusing anecdote which does not invade the privacies of life, and such notice as the public knowledge of facts and circumstances may supply, not unseasoned with that favourable interpretation which contemporary biography claims.

Portraits of Sir H. Hallford and Sir Astley Cooper embellish the volumes.

Not looking for much original or certain matter, after what we have said; and having, indeed, observed several mistakes, we can only recommend those who would "throw physic to the dogs," to read *Physic and Physicians*, for the entertaining gossip they will find in these pages. Much is not new, and of more we may say, if not true, it is well enough invented; of which take the following examples:—

Dr. Mounsey, "by way of ridiculing family pride, used to confess, that the first of his ancestors, of any note, was a baker and dealer in hops, a trade which enabled him, with some difficulty, to support his family. To procure a present sum, this ancestor had robbed his feather-beds of their contents, and supplied their deficiency with unsaleable hops. In a few years, a severe blight universally prevailing, hops became more scarce, and of course enormously dear; the hoarded treasure was ripped out, and a good sum procured for hops, which, in a plentiful season, were of no value; and thus, the doctor used to add, 'our family hopped from obscurity.'"

"It is a singular fact, that there are now confined in the public and private establishments for the treatment of insanity in London

and the neighbourhood, no less than sixty men and women who consider themselves the legitimate but unacknowledged sovereigns of the country! One female patient insists upon asserting that she is the real Victoria, and that she was confined in a madhouse, in order to prevent her from ascending the throne of her forefathers. This patient most pertinaciously affirms that she was sent to the asylum by Lord Melbourne, in order to make way for a lady with whom he was in love, and who now occupies the throne. It is most laughable to witness the pomposity with which this poor mad creature struts about the ward, exclaiming, 'Fall back! clear the way for your illustrious Queen Victoria.'

"A curious case is related, which shows that a person labouring under derangement of mind may be conscious of his infirmity. An intriguing, unruly, vicious, male lunatic, was detected with a piece of iron, which he had contrived to shape like a dagger, with a handle firmly fixed to it. Of course it was removed. He immediately became excessively abashed, and restraint was placed on him, and he was secured with handcuffs. On this he lost all command of temper, and, uttering the most revolting imprecations, exclaimed to his keeper, 'I'll murder you yet: I am a madman, and they cannot hang me for it!'"

MISCELLANEOUS.

The Stranger's Intellectual Guide-Book to London, for 1839-40. By A. Booth, F.S.A., &c. Pp. 152. London, 1839. Hooper.

ONE of the most useful books of the kind we have seen, and one much wanted by those who visit the metropolis with a view to profit by its many excellent institutions. There are very many good accounts of its public societies, describing their objects, and pointing out the times and places where they meet. Exhibitions, museums, and other sources of delight and instruction, are also all clearly indicated; and the stranger is put in the best way of availing himself of every opportunity of seeing what is worth seeing to advantage. It is a capital guide for every intelligent person.

The Churches of London: a History and Description of the Ecclesiastical Edifices of the Metropolis. By George Godwin, jun., Architect, F.R.S. and F.S.A., assisted by John Britton, Esq., F.S.A. &c. No. XXX. London, 1839. Tilt.

THE concluding number of a pleasing little publication, to which we have frequently called the attention of our readers during its progress. An unassuming preface thus describes its nature and character:—

"An attempt has been made in the following pages to divest topographical and architectural descriptions of technicalities; and, by the introduction of critical remarks on the buildings, biographical notices of eminent individuals connected with them, and by notes, illustrative of the manners and position of our ancestors, to render the work as interesting to the general reader as was consistent with its express purpose,—that of presenting a faithful account of the churches in the city of London. We have, perhaps, exposed ourselves to the remark, that we have sometimes departed in a degree from the received antiquarian maxim, 'prodesse quam delectare,'—that we have sought to please, as well as to instruct; but it is hoped, that the motive which influenced the departure (namely, the desire of inducing attention to the subject on the part of a large class of readers who, otherwise, might not have regarded

it), will be deemed sufficient, on reflection, even by the most scrupulous antiquary. Apart, too, from this, we have endeavoured, by connecting each building with various remarkable events and persons, to render the churches storehouses of pleasant memories (if we may so speak), and to invest them with an interest in the minds of their frequenters, distinct from, although connected with, their sacred character."

The work is, with great propriety, dedicated to the Bishop of London.

A New and Complete Set of Traverse Tables; shewing the Differences of Latitude and the Departures to every Minute of the Quadrant, and to five Places of Decimals: together with a Table of the Lengths of each Degree of Latitude and corresponding Degree of Longitude, from the Equator to the Poles; with other Tables useful to the Surveyor and Civil Engineer. By Capt. J. T. Boileau, Bengal Engineers. 8vo. pp. 96. London, 1839. Allen and Co.

THIS copious title-page describes the nature of this very laborious work of figures and tables! A single page of it frightens us to look at. What care and pains Capt. Boileau must have bestowed upon the whole mass of calculations! To the seaman in particular, but also to the engineer and surveyor, it is, no doubt, a publication of great value.

History of the Reign of Ferdinand and Isabella, the Catholic of Spain. By W. H. Prescott. 3 vols. 8vo. London, 1839. Bentley.

IT is a good proof of the judgment of readers, when really valuable works like the present run so readily into new editions, as this history has done. Justice has been accorded to it by our larger reviews; and few of the lesser caterers in the literature of the day, we believe, have failed to do their duty in recommending it to the attention it so eminently deserves.

Under these circumstances, and considering the general knowledge which the public possesses of the great merits of Mr. Prescott's performance, we need not go into any details respecting this new edition. Suffice it to say that, on comparing it with the former, we find that many useful corrections have been made by the author, and that further authorities have been consulted and quoted in support of his statements. Altogether the publication is so sterling in its matter, and so able in its execution, that it must always rank among the best historical productions relating to Spain which our language can boast.

A Discourse on Ethics of the School of Paley, by William Smith, Esq., Barrister-at-Law. 8vo. pp. 85. (London, Pickering.)—With due admiration of natural science, as a magnificent demonstration of the existence of a God, Mr. Smith seems to think that the characteristics of the Divinity may be somewhat obscured by not looking sufficiently beyond for his higher attributes.

ORIGINAL CORRESPONDENCE.

To the Editor of the Literary Gazette.

SIR,—Your facetious Cork correspondent, R.S., in your last Number, is rather severe upon our rulers, for having taken the very necessary precaution of having the value imprinted upon our shilling and sixpenny pieces. R. S. is, perhaps, not aware of the fact, that before this practice existed thousands of sixpenny pieces were gilded, and passed to the unwary as half-sovereigns. To such an alarming extent was this fraud practised, and so severely was it felt by the humble classes, that it was considered necessary, in order to counteract the evil, that the imprinting complained of by R. S. should be adopted.—Respectfully yours, I. S.

Grafton Street, Soho, 30th August, 1839.

ARTS AND SCIENCES. BRITISH ASSOCIATION.

THE reception and election of members began on Thursday, in a large room in King Edward's School; and all information respecting the breakfasts, ordinaries, lodgings, meetings of the Sections, &c., continues to be furnished there. The general ordinary is fixed for Thursday, the 29th, in the Town Hall.

At one o'clock this day (Saturday), the General Committee holds its first meeting in the library of King Edward's school; and on Thursday, at three o'clock, in the same place, to determine where the next meeting of the Association is to take place. From what passed last year at Newcastle, we presume there can be no doubt but that Glasgow will have the preference.

The Sections, on Monday, are to meet as follows:—

- Section A. Mathematics and Physics—King Edward's School, New Street.
- B. Chemistry and Mineralogy—Copper Company's Room, Cannon Street.
- C. Geology and Physical Geography—Philosophical Institution, Cannon Street.
- D. Zoology and Botany—Athenæum, Temple Street.
- E. Medical Science—Medical School, Paradise Street.
- F. Statistics—Billiard Room, adjoining the News Room.
- G. Mechanical Science—Shakespeare Room, New Street.

In case of the subdivision of any of the Sections, rooms will be appointed for the purpose.

The Sectional Committees will meet on Monday, the 28th of August, at ten A.M., and on every succeeding day of the week, at the same hour, in rooms adjacent to the Section Rooms, for the transaction of the business specified in instructions delivered to the Secretaries of each Section.

The Model Room will be open during the whole week of the Meeting, from eight A.M. to five P.M.

Evening Meetings, at eight P.M.
On Monday evening, the 28th of August, the first General Meeting of the Association will be held in the Town Hall; when the Rev. William Vernon Maucourt, F.R.S., and the president elect, will take the chair.

On Tuesday evening the Town Hall will be opened for conversation.

The arrangements for Wednesday and Thursday evenings are left for the determination of the General Committee.

On Friday evening the Town Hall will be opened for conversation.

On Saturday evening the concluding General Meeting of the Association will take place, when the proceedings of the General Committee, and the grounds of the seasonal grants of money sanctioned by them, will be explained.

Excursions, &c.—An Excursion to Dudley is planned for Friday, the 30th of August, for the purpose of allowing the non-resident Members of the Association an opportunity of visiting the Iron Works, the Sedgley Hills, the Rowley Hills, the Limestone Caverns, and other interesting objects. A special programme will be prepared of the intended route and plan of this excursion.

The Horticultural Exhibition will take place in the Botanic Garden, Edgbaston, on Wednesday the 29th, when the Members of the Association are invited to be present.

We lament to notice the death of Mr. Corrie, whose eloquent pleading for Birmingham at the Liverpool meeting was noticed in our *Gazette*. He was an accomplished man, and an honour to Birmingham in all its scientific and philosophical pursuits. His death will throw a shade of gloom on the meeting.

FINE ARTS.

THE DAGUERRE SECRET.

AT the weekly sitting of the Academy of Sciences, on Monday last, the process of M. Daguerre, for the formation of photogenic drawings, was, as had been previously announced, communicated to the public. From an early hour, all the seats allotted to the public were occupied; and upwards of 200 persons, disappointed of gaining admission, were stationed in a crowd in a court of the Institute, and formed a kind of scientific *émeute*. Every body was anxious to hear the secret, every

body to catch the *mot*; all were desirous of learning whether their own scientific conjectures would be confirmed or not.

At three o'clock, M. Arago commenced his explanation. We shall not attempt to follow the great *savant* through all the details of his long statement, a large proportion of which related to the history of the discovery,—a subject already pretty well known to the public; and we shall only mention as much of that part of it as belongs to Messrs. Niepce and Daguerre. In a similar manner, our account of the process itself will be brief; both because M. Arago was obliged to give only a *résumé* of it, and because it is announced that, in a few days' time, the documents communicated by M. Daguerre, under seal to the Committee of the Deputies, on his grant, will be published, and the inventor himself will give a series of public representations of the actual performance of his method.

M. Arago, after alluding to the history of the camera obscura, originally discovered by Porta, a Neapolitan chemist, reminded the Academy that, as early as 1566, the influence of light on what the alchemists termed *lune* or *argent corné* (chlorure of silver), had been observed, and was mentioned in the work of Fabricius. A Frenchman, named Charles, at the commencement of the present century, had made use of a sensitive paper for the tracing of outlines, by the action of light, but had died without leaving any account of his method. After this came the memoir of Wedgwood, of 1802, &c.; a part of the history of the discovery too well known to need repetition. The late M. Niepce, M. Arago proceeded to state, was living near Châlons-sur-Saône, occupied in scientific pursuits, and appeared to have commenced his photographic experiments in 1814. His first connexion with M. Daguerre commenced in 1826, when, through information received from an optician at Paris, he learned that this gentleman was engaged in an independent series of photogenic researches, and especially in trying to fix the images of the camera obscura. They associated their labours in 1829, after M. Niepce had visited London in 1828, and had presented his memoir on his photogenic discoveries to the Royal Society. It is proved that for the *photographic copying* of engravings, and for the formation of plates for engravers, in an advanced state of preparatory sketching of the subject, this gentleman was, in 1826, possessed of the secret of making shades correspond to shades, light parts to lights, demi-tints to demi-tints, &c.; and that he also knew how to make his drawings so produced insensible to the ulterior action of light. The act of partnership, drawn up between M. Niepce and M. Daguerre, and which afterwards stood good between his son and the latter gentleman, states that some entirely new methods had been discovered by M. Daguerre, and that they had the advantage of being able to reproduce images from sixty to eighty times more rapidly than by the processes previously adopted.

It appears that M. Niepce, in his own photographic researches, had first made use of a sheet of silver covered with the purest bitumen (called, in France, *Bitume de Judée*), which had been previously dissolved in oil of lavender. He used to heat this sheet of silver till the oil was completely evaporated, and only a kind of whitish powder remained adhering to the surface. He then placed the sheets so prepared in the focus of the camera obscura, and obtained the image of the object; but the trace was hardly visible. To obviate this imperfection, M. Niepce next thought of plunging the sheet,

when removed from the camera obscura, into a mixture of oil of lavender and oil of petroleum,—a method that succeeded and augured still further improvement; for the image became visible like an ordinary engraving, and on washing the sheet with distilled water, left the representation permanent. As a further improvement of this, M. Niepce used a new mixture of sulphuret of potassium and iodine; but the light acted very slowly upon it, and the iodine, spreading itself over the surface, rendered the image confused and obscure. The oil of petroleum, first used by this gentleman, was found to have the property of attaching those points of the metallic surface, which had been preserved from the action of light by the shades, while it was of no effect on those parts touched by the solar rays.

It was at this stage of the invention that M. Daguerre's labours were joined to those of M. Niepce; and it is only after a long series of experiments, carried on with unwearied perseverance for many years, that, after M. Niepce's death, M. Daguerre has at length resolved the problem to its present extent. We omit the history of these experiments, and pass on at once to the actual process as now used by its author.

A sheet of copper, plated with silver, is washed carefully in a solution of nitric acid, which removes from it all the extraneous matters on its surface, and especially any traces of copper from the silver surface. A slight degree of friction is requisite in this process, but it must not be applied always in the same direction. M. Daguerre has observed, that with the friction used in a particular manner, a sheet of copper thus plated with silver answered better than a sheet of silver alone; and he infers from this, that voltaic agency is not unconnected with the effect. When the sheet is thus prepared, it is placed in a closed box and exposed to the vapour of iodine. This vapour is made to pass through a very fine sheet of gauze, to render its distribution more equable over the surface of the silver, and in order to effect this object (which is quite indispensable) more certainly, the sheet has a small metallic rim raised round all its edges. A thin coating, of a yellow colour, is thus formed on the surface of the sheet, which is estimated by M. Dumas at not more than the *millionth part of a millimetre* in thickness. This sheet, when covered with this substance, is of the most excessive sensibility to light; and is thus ready for the camera obscura. M. Daguerre, in the instrument which he uses, employs a piece of unpolished glass, which he brings first of all into the focus of the lens, in order to determine the exact point at which the sheet should be placed; and, as soon as this is determined, the sheet is placed accordingly. A few seconds, or minutes, according to the time of day, the state of the atmosphere, &c., suffice for forming the photogenic image; but it is hardly, if at all, visible on the surface of the sheet. To make it so, the sheet is placed in another box, and exposed to the vapour of mercury, heated to 69° Reaumur, or 167° of Fahrenheit. One of the most curious circumstances attending this part of the process is, that the mercury must act at a certain angle. If the drawing is intended to be seen vertically, it must be suspended over the mercury at an angle of 45°; if it is to be seen at an angle of 45°, it must be suspended horizontally. On being taken out from the mercury-bath, the sheet is plunged into another bath of the hypo-sulphite of soda; this solution attacking the parts upon which the light has not been able to act, and re-

specting the light parts,—being the very inverse of the action of the mercury. It may be supposed, therefore, observed M. Arago, that the light parts of the image are formed by an amalgamation of mercury and silver, and the dark parts by a sulphuret of silver at the expense of the hypo-sulphite of soda. M. Arago observed, that no satisfactory reason had yet been given for this latter part of the process. The sheet is finally washed in distilled water, and the operation is terminated.

The drawing, thus obtained, is perfectly insensible to the action of light, but it is liable to injury, just like a crayon or pencil-drawing, and requires to be preserved under a glass. The effect of the whole is miraculous: and as an instance, we may mention that one of the drawings exhibited by M. Daguerre, on Monday, was the view of a room with some rich pieces of carpet in it; the *threads* of the carpet were given with mathematical accuracy, and with a richness of effect that was quite marvellous.

Such is the process of M. Daguerre; we must add, that it is found that the sun-light does not act equally well at all hours of the day, *now even when the sun is at equal heights above the horizon*. Thus the effect is produced better at ten in the morning than at two in the afternoon; and hence the *Daguerrotype* may be of immense value in measuring the intensity of light.

The camera obscura, employed by M. Daguerre, may be put in a box two feet long, two feet wide, and two and a half feet high: the price of the whole apparatus may be from 400 francs to 420 francs; the price of each metallic sheet is about three or four francs.

M. Daguerre has intrusted the manufacture and selling of the apparatus, to the house of Alphonse Giroux, in the Rue de Coq, St. Honoré.

We need hardly say that the most enthusiastic cheers responded from the grave benches even of the Academy, on the termination of M. Arago's description; and the President, M. Chevreul, complimented M. Daguerre in the warmest terms.*

EXHIBITION OF PICTURES,

(The works of Modern Artists.)

At the Eastern Institution, Commercial Road.

SETS the wind in that quarter? May it blow a fair, gentle, and prosperous gale! Wholly neglected by the legislature, and by the state, in these times, when, as Shree said some thirty years ago (and it as true now as it was at that period), "commerce and politics are the two gulfs which, in this country, swallow up every liberal consideration," it becomes an imperative duty on modern art to send out little squadrons of discovery, for the purpose of ascertaining on what hitherto unknown coast a descent may be most happily accomplished.

In former days we should have been puzzled to discover in what way to reach the "whereabouts" of this exhibition. Now, however, we had no difficulty on that point. Jumping into a Blackwall omnibus, we were, in the course of half an hour, set down at the door of

* It seems to us that, beautiful as this process is upon metallic substances, much of the utility of photogenic copying will be lost, unless the artist and traveller can use paper instead of copper, *silvered, iodined, and mercury-ripened*. The images produced by M. Daguerre are exquisitely correct, but gloomy-looking. They resemble moonlight pictures done in ink. We also hear from Paris, that M. Collat has succeeded in his method of copying busts, statues, or other solid objects, with mathematical precision. This is, perhaps, as remarkable a discovery as the photogenic; and one that may be applied to many valuable purposes.—Ed. L. G.

the Eastern Institution for "the small charge of one"—shilling!

The hall of the Institution is large, and well-proportioned: so large, indeed, that, although the number of pictures hung on its walls amounts to 335, it has been found necessary to "curtail it of its fair proportions," by at least a fourth in length. Originally constructed for concerts, the room is by no means well adapted to the display of works of art. Although it is evident that every effort has been made to obviate the evil, such is the position of the windows, that the effect is at once dazzling and gloomy; the eyes of the spectators are put out, and the pictures appear to be in what painters call "a half-tint."

But, in spite of this drawback, we were much pleased with the collection. Of course, a majority of the works have appeared in other exhibitions, and have already passed under our critical notice. Even if it were not so, at the close of the season, and after the town has been satiated with remarks on art, we should abstain from particular comment. When, however, we state that at the Exhibition in the Commercial Road, may be found some of the cleverest productions of Allen, Bartholomew, Barraud, Bewick, Boddington, Buss, Campion, Childe, Clint, Corbould, Miss Corboux, Mrs. Criddle, Dadd, Drummond, Duncan, Essex, Fisk, Mrs. Gent, Harrison, Hodland, Horsley, Huggins, Johnston, Joseph, Joy, Kidd, Lance, Lewis, Linton, Maclean, Martin, Noble, Oliver, Park, Psamore, Pidding, Pitts, Poole, Phillips, Priest, Rothwell, Shepherd, Stark, Mrs. Seyer, Tennant, Weigall, Wilson, Wood, Zeiter, and a host of others, we trust we have done enough to induce "the wise men of the East," to vindicate the character which has been so long attributed to them, and to avail themselves of the opportunity thus unexpectedly afforded of establishing a reputation for taste and *veritas*.

NEW PUBLICATIONS.

Mansions of England in the Olden Time; consisting of Twenty-six existing Views of some of the most characteristic Features of the Domestic Architecture of the Tudor Age; and also illustrating the Costumes, Habits, and Recreations of our Ancestors. Drawn on Stone, in the Tinted Style, with raised Lights, from his own Original Sketches (made expressly for this Work), by Joseph Nash. Printed, with the latest Improvements in Lithography, by C. Hullmaudel. London, 1839. M'Lean.

We do not recollect the precise time when we noticed in the *Literary Gazette* the specimens of this beautiful work, which, at an early period of its preparation, were circulated by Mr. M'Lean; but we perfectly recollect the admiration that we felt and expressed with respect to them. It is with great satisfaction we now say that the anticipations in which we then indulged have been completely fulfilled in the splendid volume before us. Of the general character of its contents, we cannot do better than adopt a part of Mr. Nash's own description:—

"In producing a set of views of the picturesque architecture of the mansions of England, the artist's object has been to present them in a new and attractive light; not as many of them now appear, gloomy, desolate, and neglected, but furnished with the rude comfort of the early times of 'merry England,' or exhibiting the more splendid luxury and elegant hospitality of later periods: in short, to represent 'the stately homes of England' glow-

ing with the genial warmth of their fire-sides, and enlivened with the presence of their inmates and guests, enjoying the recreations and pastimes, or celebrating the festivals, of our ancestors. Thus, not only the domestic architecture of past ages, but the costumes and habits of England in 'the olden time,' are brought before the eye; and in attempting this, the artist has endeavoured to place himself in the position of a visitor to these ancient edifices, whose fancy peoples the deserted halls, stripped of all movable ornaments, and looking damp and cheerless, with the family and household of the 'old English gentleman' surrounded by their every-day comforts, sharing the more rare and bounteous hospitalities offered to the guests, or partaking of the boisterous merriment of Christmas gambols. Those who have seen, or may hereafter visit, the places delineated, may perhaps think that the artist has not in all cases given the views of the building in which the general structure is seen to the best advantage: anticipating this objection, he begs to observe that his aim has been to select the most characteristic points of each edifice, and such as exhibit the ancient style unchanged by subsequent alterations. This principle he has studiously kept in view, in the hope that his book may be equally acceptable to the antiquarian and to the lover of the picturesque; being anxious by its means to disseminate and cherish (in so far as his humble efforts may tend thereto) the taste that is now so rapidly increasing for the old English style of domestic architecture; and to prove to all who would study its remains, that—at least, so far as this subject is concerned—

'Not harsh and rugged are the ways
Of hoar antiquity, but strewn with flowers.'

We are charmed with the delineations of the buildings (especially of the interiors); we are charmed with the strict adherence to the fashions and usages of the time, as regards the furniture, pictures, ornaments, and other accessories of the scene; we are charmed with the skilful, in some cases, the almost magical and deceptive, effect of the light; we are charmed with the united force, delicacy, spirit, and transparency of the execution; but that which we are more charmed with than all the rest, for it is the most rare and valuable species of excellence, is the happy and appropriate introduction of figures, both singly and in groups, full of character, expression, feeling, and action. As striking specimens of this particular and crowning beauty, we refer to "Doorway, East Barmham;" "Hall, Hatfield;" "Ockwells;" "Hall, Ockwells;" "Hall, Wakehurst" (superlative!); "Terrace, Bramshill;" "Southam;" "Drawing-room, Boughton-Malherbe;" "Entrance to the Grand Staircase, Holland House;" "Entrance to the Hall, Sutton Place;" "Drawing-room, Haddon Hall;" "Bay-window in Dining-room, Haddon Hall," and "Long Gallery, Haddon Hall."

THE DRAMA.

[The impulse given to dramatic literature by Mr. Macready, whether or not it may lead to any lasting results, honourable to our age and country, has been exemplified in so striking a manner by the efforts it has induced, that we are tempted to bring into one view a glance at those productions which may be said to have sprung, either partially or entirely, from that source. Knowles, Talford, and Bulwer, have already been disposed of in our pages as their publications appeared; but the following list presents an ample field beyond, whereon we might expatiate for a month to come. Landor and Willis, perhaps, do not regularly fall within our category; as the former has not written for the stage, and the latter be-

longs to another clime; but still, as their works may be attributed to the prevailing influence, we have thought it advisable to make them swell the catalogue.]

1. *Andrea of Hungary, and Giovanna of Naples.* By Walter Savage Landor. 8vo. pp. 184. London, 1839. Bentley.
2. *The Tragedy of Count Alarcon.* By the Author of "Vivian Grey." 8vo. pp. 108. London, 1839. Colburn.
3. *Blanche of Navarre.* A Play. By G. P. R. James, Esq. 8vo. pp. 98. London, 1839. Longman and Co.
4. *Two Ways of Dying for a Husband.* 1. *Dying to Keep Him;* or, *Theresa the Unworn.* 2. *Dying to Lose Him;* or, *Blanche Visconti.* By N. P. Willis, Esq. 8vo. pp. 245. London, 1839. Cunningham.
5. *Onitine; or, the Roman Conspiracy.* A Historical Drama, in five acts. By J. Edmund Reade, Esq., author of "Italy," "The Deluge," &c. 8vo. Pp. 131. London, 1839. Saunders and Otley.
6. *Festus.* A Poem. 8vo. pp. 361. London, 1839. Pickering.
7. *Aristodemus.* A Tragedy. 8vo. pp. 98. Edinburgh, 1839. W. Tait; London, Boone, and Shpkin and Co.; Dublin, Cumming.
8. *Gertrude and Beatrice; or, the Queen of Hungary.* A Historical Tragedy, in five acts. By George Stephens, author of the "MSS. of Erdely." 8vo. pp. 104. London, 1839. Mitchell.
9. *The Lords of Killingham.* A Drama. By Henry Spicer. 8vo. pp. 144. London, 1839. Fraser.
10. *The Landgrave.* A Play, in five acts. With Dramatic Illustrations of Female Character. By Eleanor Louisa Mossgu. Pp. 285. London, 1839. Smith, Elder, and Co.

THE dramatists, and ten different publishers,—every man his bird! Nothing could be more appropriate than the division of labour; and our only hope is that, in some of the cases, it may not be also a division of loss.

Mr. Landor's two plays are connected in dramatic personae, the whole belonging to the story of the famous Joan, Queen of Naples. We do not find in them much dramatic interest, nor are the *dramatis personae* such as to make amends for this deficiency. The fanciful spelling of *til*, *still*, &c., is not, perhaps, worth noticing; nor, perhaps, the confusion created by finding a *Fiammetta* in the first play, and no such name in the list of characters. The former seems to intimate affectation, and the latter hurry.

We come, then, to look for poetry, imagination, and fine classic allusion and imagery, as the features with which the author shall charm and captivate us; and though there are a few fine passages, we are obliged to confess that here, too, we are doomed to disappointment. The following, however, is worthy of Mr. Landor:—

"*Maria.* How can we love . . .
Giovanna (interrupting). Mainly, by hearing none
Decry the object; then, by cherishing
The good we see in it, and overlooking
What is less pleasant in the path of life.
All have some virtue if we leave it them
In peace and quiet; all may lose some part
By lifting too minutely bad and good.
The tenderer and the tender of creatures
Often desert the breed that has been handled
Or turn'd about, or indiscreetly look'd at.
The slightest touches, touching constantly,
Irritate and inflame."

The next is a pleasant turn upon a celebrated saying:—

"*Filippa.* Honours are joys great as such breast can hold.

Giovanna. The happy, then, in courts are numberless:

We hear the contrary.

Filippa. Never believe
This, nor another ill report of them.

Giovanna. What?

Filippa. That the great are not great to their valets;
'Tis but their valets who can find their greatness."

But playfulness is not the author's forte. —

"*Fiammetta.* Thou art not noble: say thou art most noble:

Norman—half-Norman—quarter-Norman—say it.

Beccaccio. Say an untruth!

Fiammetta. Only this one, my heart

Will faint without it. I will swear to think it

A truth, wilt thou but say it. 'Tis a truth:

Thy only falsehood thou hast told already,

Merely to try me. If thou art noble—

Noble thou art, and shalt be!

[She sobe and pauses: he presses her hand to his bosom.

Who gainsays it?

Beccaccio. A merchant's son, no better, is thy slave,

Fiammetta!

Fiammetta (smiling). Now art thou disguised, indeed.

Come, shew me specimens of turquoises,

Amethysts, emeralds, diamonds—out with 'em.

Beccaccio. A merchant's, and poor merchant's, and

am I;

Gems I have none to offer, but pure love

Proof to the touchstone,—to the crucible.

Fiammetta. What, then, or who is noble, and thou

not?

I have heard whispers that myself am not so,

Who am King Robert's daughter. We may laugh

At those who are, if thou and I are none.

Thou art my knight, Giovanni! There now; take

Thy patent of nobility, and wear it.

Boccaccio (kisses it). What other but were cobweb
after this?
Fiammetta. Ha! kiss it! but take care you don't
kiss me. [Runs away.]

The opinion of courts is not, we fear, exaggerated:—

Giovanna. Oh! for ministers
To guide my counsels and protect my people!
I would call round me all the good and wise.
Sancia (returning). Daughter! no palace is too small
to hold them.

The good love other places, love the fields,
And ripen the pale harvest with their prayers.
Solitude—solitude—so dread a curse
To princes, casts a blight to scyophants,
Is their own home, their healthy thoughts grow in it.

The wise avoid all our anxieties:
The cunning, with the tickets of the wise,
Push for the banquet, seize each vacant chair,
Gorge, pat their spaniel, and fall fast asleep."

In places, it seems, as if instead of original English,
Mr. Landor had translated, and badly translated, from
a foreign language: such, for instance, as the idiom—

"Why are not come those fools?"

But we conclude with three sterling English lines:—

"Maximin! there are more lies done than said.
Son! when we hesitate about the right,
We're sure to do the wrong."

Sooth to say, these are but scant examples from two
dramas, and from so deservedly esteemed a pen; but
Homer nodded sometimes, and Landor appears to us to
have been rather sleepy all through *Andreas of Hungary*,
and his widow *Giovanna of Naples*.

2. *Alarcos* is introduced by Mr. Disraeli, with a dedica-
tion to Lord Francis Egerton, beginning thus:—

"I dedicate to a poet an attempt to contribute to the
revival of English Tragedy: a very hopeless labour, all
will assure me. When I commenced this drama, there
were certain indications which induced me to believe that
the public taste was recurring to the representations of
that stage which has afforded us so much of national de-
light, wisdom, and glory. These indications have already
vanished; and one is almost tempted to admit the theory
of those ingenious critics, who maintain that the English
drama has performed its office, and that, in the present
state of civilisation, it has no functions to fulfil."

Upon this we might remark, that though Mr. Disraeli
and Lord Francis should fail, owing to the want of that
peculiar talent which leads to success in dramatic com-
position, the argument is not quite so clear as to the hope-
lessness of English tragedy, nor so conclusive of the En-
glish drama having been swallowed up in the gulf of
civilisation. Men may be accomplished scholars, and
even possess genius in other lines of literature, and yet
be altogether incompetent to produce even a tolerable
comédie; and therefore it is to draw a *non sequitur*
to infer thence that there can be no other man capable of
sustaining the highest elevation of dramatic literature.
Mr. Disraeli continues:—

"The theory is a very plausible one; but what theory
was ever true? And who can deny that a fine play,
finely performed, is among the noblest productions of
art? This age, denounced as anti-poetical, seems to me
full of poetry, for it is full of passion."

As for the age being full of passion, we should like to
know what age was not? "Anti-poetical":— whilst there
are skies, green fields, seas, mountains, joys, wretched-
ness, youth—

"Youth at the prow, and Pleasure at the helm,"
there will be poetry, in spite of all the utilitarians and
useful-knowingians in the world. This play was, it seems,
suggested as the writer rambled among the Sierras of
Andalusia, and—

"That was the season of life when the heart is quick
with emotion, and the brain with creative fire; when the
eye is haunted with beautiful sights, and the ear with
sweet sounds; when we live in reveries of magnificent
performance, and the future seems only a perennial flow
of poetic invention."

And he adds:—

"Dreams of fantastic youth! Amid the stern realities
of existence I have unexpectedly achieved a long-lost
purpose."

We trust that the whole of these expressions are poet-
ical, and surely cannot fancy that the dreams of the bard
have been, or are likely to be, disturbed by any "stern
realities." In the play, at any rate, we have poetry with-
out a drawback:—

"Countess. Something has chafed thee?
Alarcos. What should chafe me, child?

And when should hearts be light, if mine be dull?
Is not mine exile over? Is it sought
To breathe in the same house where we were born,
And sleep where slept our fathers? Should that chafe?

Count. Yet didst thou leave my side this very morn,
And with a vow this day should ever count
Amid thy life most happy; when we meet
Thy brow is clouded.

Alar. Joy is sometimes grave,
And deepest when 'tis calm. And I am joyful,
If it be joy, this long-forgotten hall
Once more to pace, and feel each fearless step
Treads on a baffled foe.

Count. Has thou still foes?
Alar. I trust so; I should not be what I am,
Still less what I will be, if Hate did not
Pursue me as my shadow. Ah! fair wife,
Thou knowest not Burgos. Thou hast yet to fathom
The depths of thy new world.

Count. I do recoil
As from some unknown woe, from this same world.
I thought we came for peace.

Alar. Peace dwells within
No lordly roof in Burgos. We have come
For triumph.

Count. So I share thy lot, Alarcos,
All feelings are the same.

Alar. My Florimonde,
I took thee from a fair and pleasant home
In a soft land, where, like the air they live in,
Men's hearts are mild. This proud and fierce Castile
Resembles not thy gentle Aquitaine,
More than the eagle may a dove,—and yet
It is my country. Danger in its bounds
Weighs more than foreign safety. But why speak
Of what exists not?

Count. And I hope may never."

Alas! the catastrophe turns on Alarcos getting to love
Solias, the Infanta of Castile, with more passion than
his own Florimonde of Aquitaine; and the termination is
very fatal. His ambition is powerfully portrayed:—

Alar. Prosperity!
Men call them prosperous whom they deem enjoy
That which they envy; but there's no success
Save in one master wish fulfilled, and mine
Is lost for ever."

Nor his aim more happy. Hear her speak:—

"Solias. And wherefore do I smile when I should sigh?
And wherefore do I feel when I would fast?
And wherefore do I dance when I should pray?
And wherefore do I live when I should die?
Canst answer that, good sir? Oh! there are women
The world deem mad, or worse, whose life but seems
One vile caprice, a freakish thing of whims
And restless nothingness; yet if we pierce
The soul, may be we'll touch some cause profound
For what seems causeless. Early love despoiled,
Or baffled, which is worse; a faith betrayed,
For vanity or lucre; chill regards,
Where to gain constant glances we have paid
Some fearful forfeit: here are many springs,
Unmarked by shallow eyes, and some, or all
Of these, or none, may prompt my conduct now."

At page 56, we would hint that "trifles" is not a verb
active, and to say that a "tongue trifles the church's ear" is
not catholic English; but we must not indulge in verbal
criticism, or slight objections, of which we have noted a
few. *Alarcos* is a stirring drama; and the elements of
tragedy, wickedness, headlong passions, innocent suffer-
ing, and nobility of nature, are mixed up in it with con-
siderable force and effect.

3. *Blanche of Navarre* is, we believe, the first dramatic
essay of Mr. James, so popular in historical and fictitious
authorship. It seems to us to be deficient in attributes
to fit it for successful representation; but, as a poetic
dialogue, to be by no means unworthy of the writer's
reputation. Entertaining this opinion we shall not enter
into the plot, but content ourselves with two or three
specimens of the style and sentiment:—

"On earth whichever way we turn our eyes,
We are surrounded closely by a cloud,
A sudden mist, which renders all confused
E'en close at hand, and veils each distant thing
In rayless darkness; yet as we advance
Gives the same space to light, at every step
Disclosing new events, first faint and dim,
Then clearer, till they touch us as they pass,
Whirled thro' the narrow circle of our ken.
The while to guide us, reason holds a torch,
Dim and ill-lighted o'er the one right path,
And fancy, in the cloud, bearing her lamp,
Flits round, like wild fires on some midnight moor."

A beautiful morning:—

"Oh, that the splendid scene, where God's pure truth
And universal love, in tides of light,
Pours, as if fountains of eternal splendour
Were opened in the east, to flood the heaven
With plenty-bearing rays; counselling man,
E'en by the very aspect of the sky,
To deeds of peace, and love, and charity—
Oh, that this glorious scene should be a place
Of hate, malevolence, and calumny!
Look where the morning light rests peacefully,
Like a good father's blessing, on those towers
By the Taffels gate."

The approach of night:—

"The night which shall conceal us must be nigh;
For lo, where that high cloud above the hill
Grows rosy with the sun, which sets far off,
Hid by the mountains from our eyes! More red
And redder still it grows, while we see nought
To call those blushes us, like some fair cheek
Colouring at a distant signal, known
To one fond ear, but heard by it alone.
Now fades the red away again, as if
Emotion made the very vapour pale."

4. *Tortosa*, by Mr. Willis, has, we learn, been performed
with great applause in America; and, both as regards
poetry and acting qualities, not without deserving it.

Yet the plot will not bear a close examination; and it is
difficult to reconcile the leading characters, Falcone and
Tortosa, with truth and nature, from the beginning to the
end: the former becoming much worse, and the latter
much better, than we have any right to expect. The
Juliet portion of the story, when the heroine takes a
sleepy potion, which mimics death, is not so well
wrought out; and the author's being obliged to frame
strange laws for Florence, as it were, only to bring about
his *finale*, has a very awkward effect. One odd law might
pass, but two odd laws are, like two evening guns, too
much in a single play. But with these blemishes there
are high redeeming points, and a power of imagination
and description, beyond any thing we could have expected
from the generally slight order of Mr. Willis's prose
works. We commence with an apostrophe to Money:—

"Oh, omnipotence of money!

Ha! ha! Why, there's the haughtiest nobleman
That walks in Florence. He!—whom I have bearded—
Checked—made conditions to—shut up his daughter—
And all with money! They should pull down churches
And worship it! Had I been poor, that man
Would see me not ere give his hand to me
—as I stand here—dreaded thus—looking thus—
The same in all—save money in my purse—
He would have scorn'd to let me come so near
That I could breathe on him!"

An effect of the same agent is again humorously deli-
neated in a conversation between Angelo, a poor painter of
great genius, and his serving man, Tomaso:—

"Tomaso. Thou a genius! Look! Master Angelo!
Have I not seen thee every day since thou wert no bigger
than thy pencil!"

Angelo. And if thou hast?

"Tomaso. Do not know thee from crown to heel?
Dost thou not come in at that door as I do?—sit down
in that chair as I do!—eat, drink, and sleep, as I do? Dost
thou not call me Tomaso, and I thee Angelo?"

Angelo. Well!

"Tomaso. Then how canst thou have genius? Are there
no marks? Would I clap thee on the back, and say good
morrow? Nay, look thee! would I stand here telling
thee in my wisdom what thou art, if thou wert a genius?
Go to, Master Angelo! I love thee well, but thou art
comprehensible!"

Angelo. But think'st thou never of my works, Tomaso?
Tomaso. Thy works! Do I not grind thy paints? Do I
not see thee take up thy palette, place thy foot thus,
and dab here, dab there? I tell thee thou hast never done
stroke yet, I could not take the same brush and do after
thee. Thy works, truly!"

The Duke patronises Angelo, and a large sum is awarded
him for a picture—and mark the difference:—

Tomaso. For the most excellent painter, Angelo, two
hundred ducats! The genius of my master, flashes upon
me. The Duke's greeting and two hundred ducats! If I
should not have died in my blindness but for this eye-
water, may I be hanged. (Looks at Angelo.) He is studying
his picture. What an air there is about him—lofty, unlike
the vulgar! Two hundred ducats! (Observes Angelo's hat
on the table.) It strikes me now that I can see genius in
that hat. It is not like a common hat. Not like a bought
hat. The rim turns to the crown with an intelligence.
(Weighs the ducats in his hand.) Good heavy ducats!
What it is to refresh the vision! I have looked round,
ere now, in this very chamber, and fancied that the fur-
niture expressed a melancholy dulness. When he hath
talked to me of his pictures, I have seen the chairs smile.
Nay, as if ashamed to listen, the very table has looked
foolish. Now, all about me expresseth a choice pecu-
liarity—say you would say, how like a genius to have such
chairs! What a painter's table! Two hundred ducats!

Angelo.

"What hast thou for supper?
Tomaso. Two hundred ducats, my great master!
Angelo (absently). A cup of wine! Wine, Tomaso! (Sits
down.)

"Tomaso. (So would the great Donatello have sat upon
his chair! His legs thus! His hand falling thus!) (Aloud.)
There is nought in the cellar but stale beer, my illustrious
master! (Now, it strikes me, that his shadow is unlike
another man's—of a pink tinge, somehow—yet that may
be fancy.)"

This is playful enough; but we proceed to select some
of the higher passages:—

Women's Love.

"Woman loves once unthinkingly. The heart
Is born with her first love, and, new to joy,
Breathes to the first wind its delicious sweetness,
But gets none back! So comes its bitter wisdom!
When next we think of love, 'tis who loves us!"

A Portrait.

"I saw a soul!
His eyes were light with it. The forehead lay
Above their fires in calm tranquillity,
As the sky sleeps o'er thunder-clouds. His look
Was mixed of these—earnest, and yet subdued—
Gentle, yet passionate—sometimes half godlike
In its command, then mild and sweet again,
Like a stern angel taught humility!
Oh! when he spoke, my heart stole out to him!
There was a spirit-echo in his voice—
A sound of thought—of under-playing music—
As if before it ceased in human ears.
The echo was caught up in fairy-land!"

An Artist's Feeling.

"My soul is drunk with gazing on this face."

I reel and faint with it. In what sweet world,
Have I traced all its lineaments before?
I know them. Like a troop of long-lost friends,
My pencil wakes them with its eager touch,
And they spring up, rejoicing. Oh, I'll gem
The heaven of fame with my irradiate pictures,
Like kindling planets—but this glorious one
Shall be their herald, like the evening star,
First-lit, and leading of its fire to all.
The day fades—but the lamp burns on within me.
My bosom has no dark, no sleep, no change
To dream or calm oblivion. I work on
When my hand stops. The light tints fade. Good
night.
Fair image of the fairest thing on earth,
Bright Isabella!"

Love.

"You are a woman, though your brow's a rock,
And know what love is. In a ring of fire
The tortured scorpion stings himself, to die—
But love will turn upon itself, and grow
Of its own fang immortal!"

A Touching Voice.

"Hast never heard him speak
With voice unlike his own—so melancholy,
And yet so sweet a voice, that, were it only
The inarticulate moaning of a bird,
The very tone of it had made you weep?"

Unequal Attachments.

"See here! There was a small, earth-creeping mole,
Born by the low nest of an unfledged lark.
They lived an April youth amid the grass—
The soft mole happy, and the lark no less,
And thought the bent sky leaned upon the flowers.
By early May the fledgling got his wings;
And, eager for the light, one breezy dawn,
Sprang from his nest, and, buoyantly, away
Fled forth to meet the morning. Newly born
Seem'd the young lark, as in another world
Of light, and song, and creatures like himself;
He soared and dropp'd, and sang unto the sun,
And pitted every thing that had not wings—
But most the mole, that watched even eyes
To see the light he floated in!"

With this very sweet similitude we close our extracts
from *Tortoise the Unweaver*, which would have been a better
drama had not the author determined to make it end
happily, and warped circumstances to that effect, instead
of letting events take the natural course where such pas-
sions were afloat, and then it must have had a tragic
catastrophe.

Bianca Fiacotti was an earlier production of the same
hand, and has been two years on the New York stage.
We shall therefore make free to pass it without encroaching
on our rather limited space by further observation on
the author's dramatic talent, which he has established as
firmly by his later work.

Haymarket.—Macready's appearance here in
Othello, and the *Lady of Lyons*, has filled the
theatre to the ceiling. The drama continues
its triumph, and need only be conducted with
judgment, propriety, and spirit, to ensure its
great success.

English Opera.—On Thursday evening, *Scaramuccia*
was to have been performed, but Mr.
Balfie was obliged to make an apology, in con-
sequence of Mr. Leffler being too drunk to
play his part.* This person's unfortunate propen-
sity has been but too often apparent on the
stage; from which such conduct must, if per-
severed in, banish him for ever. Mr. Stansbury
has undertaken his office, and *Scaramuccia* was
reannounced for last night.

Strand Theatre.—An eccentric and most
laughable dramatic sketch, called *A Good
Night's Rest*, and supported entirely by Messrs.
Bennett and J. Lee, has been produced here.
It is full of whim and fun, and very cleverly
acted, so as to keep the audience in the merriest
possible mood from beginning to end.

VARIETIES.

American Railroads.—From the following
(copied from the "National Intelligence"), it
appears that the Americans, in railroad arrange-
ments, go pretty considerably a-head of us poor

* Mr. Balfie made a manly address to the audience, and
read the following extraordinary note from the offender:—
"DEAR BALFIE, I am very sorry I have drank so
much claret. I can't play to-night; d—n it."

"Yours faithfully,

"ADAM LEFFLER."

The audience received it in proper spirit: whilst they
hissed the writer, they did justice to the manager, by their
warm plaudits at the conclusion of his apology.

Europeans. The train between New York
and Baltimore has two cars fitted up in a
splendid manner for the use of the ladies, and
such gentlemen as have ladies in charge.
These cars are elegantly curtained, carpeted,
and adorned with costly mirrors; and at the
ends of each of the cars, opening into them, is
a magnificent *sanctum sanctorum*, for the ex-
clusive use of the ladies, in addition to which a
stewardess is appointed to wait upon them.
The other carriages (we are informed) are so
adapted as to communicate with each other,
forming a continuous promenade through the
whole, with seats on the sides for occasional
resting.

Paris in Hot Water.—**Artesian Wells.**—At
the last sitting of the Academy of Sciences, M.
Arago stated that he had that morning been
making some thermometrical experiments of
the Artesian well at Grenelle, in order to ascer-
tain the temperature at the depth which had
already been attained, viz. 483 metres, or 1584
feet. When the workmen had reached 460
metres the chalk was of a green colour, indica-
ting the proximity of water. Since then the
chalk had become mixed with clay, and of a
dark colour, a still stronger indication that the
sheet of water which it is intended to reach is
near. M. Arago used the thermometer of M.
Wulferdin, and after having taken all the
necessary precautions in order that the pressure,
which at such a depth is equal to 50 atmos-
pheres, might not injure the bulb; six thermo-
meters of the same kind were successively let
down to a depth of 481 metres, care having
been taken not to lower them until 36 hours
had elapsed after the boring, in order that the
heat which this work might have communicated
should have subsided. The thermometers were
left in the well for 36 hours. The heat at this
depth was 27 degrees of Reaumur, or 92½
of Fahrenheit, being about 23 metres for each
degree of temperature. M. Arago expressed a
hope that no water might be found for 100 me-
tres more, as in that case there would be a
permanent hot spring at the very gates of
Paris.—*Times*.

Zoology.—The French Jardin des Plantes
has recently received a black bear from Kam-
schatka; an emu, and a rare species of crocodile,
from the South Seas; tea plants from the
Brazil; and other botanical rarities.

Important Discovery.—Extract of a letter
from New York, dated July 1, 1839:—"I must
now draw your attention to a subject which
will shortly make considerable noise in the
scientific world. Doctor H. H. Sherwood, with
whom I have been acquainted more than 30
years, has invented a mathematical instrument,
whereby, without the aid of a quadrant, sextant,
or ephemerometer, and without taking a celestial
observation, it is practicable and easy at sea and
on land, by night or by day, in cloudy or clear
weather, to determine the latitude and longitude
of any place on the surface of the globe, with
the greatest accuracy; and also to determine the
variation and inclination of the magnetic needle,
at all places and at all times, past, present, and
future. He is now publishing his work, and
will visit England some time this season."—
Jersey Paper.

Falling Stars.—During the night of Friday
and Saturday last, the 9th and 10th of August,
the heavens were beset with little falling
stars of extraordinary brightness. Mr. Forster
counted above six hundred of them. It is not a
little singular that the peasants of Franconia
and Saxony have believed, for ages past, that
St. Lawrence weeps tears of fire, which fall
from the sky every year on his fête (the 10th of

August). This ancient popular German tradi-
tion, on observation, has been found within
these few years to be a fact, which engages the
attention of astronomers. The inhabitants of
Brussels can bear witness, that in the night of
the 10th this year St. Lawrence shed abundance
of tears.—*Brussels Paper*.

Steam on the Continent.—The Royal Aca-
demy of Sciences of Berlin, appreciating the
utility of the works published by the Comte de
Pambour, and particularly of his "Theory of the
Steam Engine," which has just appeared in this
country, has, in its sitting of the 6th of June,
elected him, by unanimity of votes, a member
of the Academy.—*Berlin Letter*.

Agriculture.—A Professorship of Agriculture
is about to be established at Oxford; which
example Cambridge will probably follow.

Restoration from Drowning.—Dr. Fair-
brother, of Clifton, has restored animation, after
immersion in the water for a quarter of an
hour, by stopping the mouth and sucking the
foul air from the lungs through the nostrils,
whilst respiration was promoted by pressing on
the abdominal muscles on the sides.

LITERARY NOVELTIES.

A new edition of Gulliver's Travels, in monthly parts
is announced, illustrated by Woodcut, after Designs by
Grandville, and with Notes and Elucidations from various
Original and Manuscript Sources; An Essay on Philoso-
phy and Satirical Fictions; and A New Life of Swift,
by Dr. W. C. Taylor.

The Scottish Peerage.—A continuation of Robertson's
Collection of "Proceedings relating to the Peerage of
Scotland," which terminates at April 1788, is announced
in a supplementary volume, commencing at the period
where Mr. Robertson concludes, and brought down to the
day of publication, by William Turnbull, Esq., Advocate,
F.S.A., Scot., &c.

LIST OF NEW BOOKS.

Course of Mathematics for the Use of Students at
Addiscombe, by the Rev. J. Cape, Vol. I., 8vo. 15s.—His-
torical Records of the British Army, 7th Dragoon
Guards, 8vo. 8s.—Little Fables for Little Folks, 1s. 6d.—

ADVERTISEMENTS,

Connected with Literature and the Arts.

BRITISH ASSOCIATION for the ADVANCEMENT OF SCIENCE.

The Members of the Association are respectfully informed that Osborn and Sons, Bennett's Hill, Birmingham, next Door to the Post-office, have for Sale Hawkins's Everlasting Pen, made of Gold, tipped with a Metallic Alloy, as much harder than Rhodium as Steel is harder than Lead: will endure longer than the Ruby; yields Ink as freely as the Quill; is as easily wiped, and, if left unwiped, is not Corroded. Five Years' constant Use of this elegant Pen has not produced sensible wear. Invented by JOHN ISAAC HAWKINS, Civil Engineer, Life Member of the British Association for the Advancement of Science, and Manufactured under his Direction.

Sold wholesale at his Office for British and Foreign Patents, Chancery Chambers, Quality Court, Chancery Lane, London; Office Hours, Ten till Four; and, retail, by Farthing, 46 Cornhill; Houghton, 102 New Bond Street; Reake and Varty, 31 Strand; W. Lund, 64 Fleet Street; T. Lund, 57 Cornhill; J. Smith, 15 Palace Row, Tottenham Court, New Road; in Edinburgh, by Anderson and Son, 23 St. Andrew Square; and in Newcastle-upon-Tyne, by Currie and Bowman, 23 Collingwood Street.

On the 30th instant,

TYAS'S ILLUSTRATED ROBINSON CRUSOE, with Engravings, from Designs by Grandville, Part I. Price 1s.

"Perhaps there exists no work, either of instruction or entertainment, in the English language, which has been more generally read, and more universally admired, than the Life and Adventures of Robinson Crusoe. It is difficult to say in what the charm consists, by which persons of all classes and denominations are thus fascinated; yet the majority of readers will recollect it as among the first works that awakened and interested their youthful attention; and feel, even in advanced life, and in the maturity of their understanding, that there are still associated with Robinson Crusoe, the sentiments peculiar to that period, when all is new, all glittering in prospect, and when those visions are most bright, which the experience of after-life tends only to darken and destroy."

R. Tyas, 50 Cheapside.

NOTICE TO PUBLISHERS.—To be Sold,

a MS. of Twenty-one elegant Extracts from Sir Walter Scott's Novels, for the Use of Schools, with explanatory Notes in French, to facilitate the Translation. Also, a Key to the same Work, arranged by a Professor of long experience in Teaching.

This MS. claims the attention of the Trade. To be seen at Mr. T. Bradburn's, 30 Eaton Street, Piccadilly, who will transmit to the Purchaser, the Author being Abroad. Also, in progress, Notes, in French, to the Italian Work of "Traflet Principale," by Pellico, to facilitate Translation into French; and an elegant Translation into French of the same Work, as a Key, corresponding with the Notes. The Notes may be published separately, and will be comprised in a book of from Two to Two and a Half Sheets.

ONE-THIRD SHARE OF NEWSPAPER

PROPERTIES to be SOLD, yielding a considerable Profit. Three Thousand Pounds are required for the Purchase. A Gentleman of political influence would find his Objects assisted by embarking in those well-established and lucrative Newspapers. Letters to be addressed (post-paid) to L. M., care of Messrs. Grey and Pelly, Booksellers, Piccadilly.

AN ENCYCLOPÆDIA OF RURAL SPORTS.

By D. P. BLAINE.

PART I.

THE ORIGIN, PROGRESS, AND PRESENT STATE OF FIELD SPORTS.

Rude Methods employed for capturing Animals by the Primitive Races of Mankind—Progress of Sporting after the Diffusion of Mankind—The Field Sports of Asia, of Africa, of America, of Europe—British Field Sports; their Progress from the Earliest Times to the Norman Conquest—National Sports of England, of the Welsh, of the Scotch, of the Irish—British Field Sports, from the Norman Conquest to the Time of James the First—Popular Athletic Games of Great Britain: Wrestling, Cricketing, and Skating—Games of the Ball: Rackets, Tennis, Golf, &c.—Archery of Great Britain, Ancient and Modern.

PART II.

THE PHILOSOPHY OF FIELD SPORTS.

Their Moral Character—Benefits derived from them, to both Body and Mind—The Anatomy and Physiology of Animal Bodies—The Exterior Form of Quadrupeds—Geographical Distribution—Effects which varied Temperature, Food, and Domestication, have on them—Their Migrations, Hibernation, and Means of Offence—Longevity, Decay, and Death—The Art of Preserving their Bodies after Death—The Instinctive and Rational Endowments of Animals.

PART III.

PRACTICAL SPORTING—HORSE RACING.

The Origin of Horse Racing—History of the Race of Former and Present Days—Of Horses: those of Africa, Asia, America, and Europe—Horses of Great Britain—The English Race—His Proportions of Body—Breeding and Rearing—Breaking and Training—Paces—Stable Management, &c. &c.—The Practice of Racing—Its Speculative Character—Localities of Racing or Race-Courses—Rules, Regulations, and Laws of the Jockey Club, &c. &c.

PART IV.

HUNTING.

Its History, Ancient and Modern—Conventional Terms used in Hunting—Natural History of the Dog—Of Hounds: their Breeding, Rearing, Kennel Management, Feeding, and General Treatment, in Health and Disease—Training, Conditioning, and Multiplication—Practice of Fox Hunting, Hare Hunting, Deer Hunting, Red Deer Hunting, Fallow Deer Hunting, and Roe Hunting—Otter Hunting—Badger Hunting—Hunting the Marten and the Wild Cat.

PART V.

COURSING.

Its Character as a Field Sport—Natural History of the Greyhound—Breeding, Rearing, and Training—The Ancient and Modern Practice of Coursing—Match Coursing: its Localities, and Rules and Regulations—Simple or Unmatched Coursing.

PART VI.

HAWKING.

Systematic History of Birds—Their Structure and Functions—Phenomena of their several Actions, as Walking, Swimming, Climbing, Perching—Geographical Distribution—Their Incubation and Means of Preserving the Vitality of their Eggs—Method of Pinioning them with Safety—General Economical Uses of the Feathered Races. *The Practice of Hawking*—Birds of Prey: Vultures, Eagles, Falcons, and Hawks—Formation of their Wings, Beaks, and Talons, as Characteristics of the Degree of their Nobility, and of their Efficiency in capturing and tearing to Pieces other Birds—Methods of procuring Falcons and Hawks, by taking them from the Nest or by the Trap—The Apparatus used in Taming and Training them to Hawking Purposes—Their Mewing, Hooding, Feeding, and Imping of their Feathers—Their Flyings at the Heron, Kite, Pheasant, Partridge, Rook, Magpie, and Water-Fowl, fully described.

PART VII.

SHOOTING.

Explosive Substances—The Greek Fire—Gunpowders—Percussion Powder—Fire-Arms—The Fowling-Piece—Proving Gun-Barrels—Calibre or Bore, Length, Weight, and Necessary Strength of Barrels—Mode of Boring—Their Range, Force, Regularity of Effect, Recoil, Safety, &c. *The Rifle Gun, and Modern Improvements*—The several Parts of a Gun described—Breechings, Locks—The Flint-Lock—Detonating or Percussion Lock—The Improvements of Modern Gun-makers—Shot considered as regards Size for various Shootings; also the Quantity and Quality of them—Copper Caps—Cap Chargers—Shot-belt, and Shooting Habitments.

The Practice of Shooting—Examination and Trial of a Gun—Methods of Loading—Proper Proportions of Powder and Shot—The Art of Shooting Flying—Dogs employed in Shooting, as the Setter, Pointer, Spaniel, and Retriever, traced from their Origin—Their Breeding, Breaking, and Appropriation to their several Uses.

Grouse Shooting—Black Cock—The Ptarmigan, with the most celebrated Localities resorted to—Partridge Shooting—Red-legged Partridge Shooting—Quail Shooting—Pheasant Shooting—Woodcock Shooting—Snipe Shooting—Ruff and Reeve Shooting—Land and Water Ralls, Dotted, Knot, Plover, Curlew, the Heron, Bittern, and all the numerous kinds known by the term Wild-Fowl, from the gigantic Swan to the diminutive Teal—Pigeon Shooting—The Battue and Rook Shooting.

PART VIII.

COCK FIGHTING.

The Antiquity of Training Birds to Fight, as of Quails in the East—Feeding, Trimming, and Handling the Game-Cock.

PART IX.

FISHING.

Systematic History of Fishes—The Linnean Arrangement—Their Anatomy and Physiology, Organs of Sense and Motion—Digestive, Respiratory, and Reproductive Systems—Diseases and Migrations—Division into Fresh and Salt-Water Fishes—The Importance of Fishes to Mankind.

The Practice of Angling—Angling Apparatus: Rods, Lines, Floats, Fishing-Hooks, Reels, Landing-Net, Gaff, Clearing-Ring—Disgorger—Drag-Hook—Minnow Kettle—Minnow Net—Fish Pannier—Tackle Pocket-Book, &c. &c.—Directions for the Manufacture, Preservation, and Repair of Fishing-Tackle.

The Localities of Angling, abroad and at Home—Angling divided by its Months—Prognostics of Weather—its Pleasures, Pains, and Dangers—Hortatory Remarks adapted to the Subject, particularly to the Treatment of Persons apparently drowned.

Baits: Living and Dead, Natural and Artificial—Entomology of Angling, or Living Insects, Flies, Worms, Caddis, Gentles, Grubs, and Beetles; Pastes, Ground-Baits, Artificial Representatives of Living Animals, Sham Fish, Frogs, &c.—The principal Fish angled for in England: the Minnow, Bullhead, Loche, Gudgeon, Bleak, Dace, Graining, Roach, Rudd or Red Eye, Orf, Bream, Barbel, Cat, Tench, Perch, Ruff, Trout, Grayling, Gwinlad, Red Char, Gilt or Case Char—The Salmon Family: the Salmon, Salmon Trout, Bull Trout, Par or Samlet, &c. &c.; Trout, Pike and Jack, Eels, Flounder, Mullet, Smelt, Mackerel, Whiting, &c.

Fly-Fishing, with the Artificial or Natural Fly of the Season—Methods of Dressing or Making Artificial Flies—Practical Directions for Throwing the Fly, Spinning the Minnow, &c. &c.—Sea-Fishing, &c. &c.

ADDRESS.

Rural Sports have, in all ages, continued a favourite amusement of large portions of mankind; and that the progress of civilisation and refinement has rather strengthened than subdued the passion for these exhilarating pursuits, is sufficiently evinced by their present popularity among all ranks of society.

The popularity of Rural Sports has, of late years, led to several books, whose chief object was to furnish practical instruction in the arts and contrivances necessary to the formation of the accomplished sportsman, and recently some publications have appeared which have discussed more scientifically particular branches of the subject; but no writer hitherto has taken that comprehensive view of the entire range of Rural Sports, which seems to be demanded by the increased and still increasing number of their admirers and votaries.

The work here offered to the public is no hasty production, more than seven years of assiduous labour having been devoted to its completion. It has been throughout the author's aim to combine rational amusement with correct and extensive information; and, in the prosecution of his plan, the author has allowed himself an ample field, that he might introduce and illustrate all the more important and material facts. In tracing Rural Sports to their origin, he has carried his researches back to the infancy of society, when man was compelled in self-defence to shake war upon the wild animals by which he was surrounded; and he has described the simple methods first in use, by which they were ensnared or overcome. Descending with the stream of time, he has developed the gradual progress of improvement in the construction of implements, and in the adoption of aggressive and defensive plans, until they have reached their present state of comparative excellence; bringing down the history of Rural Sports to the period when those pursuits, which were originally embraced for purposes of personal security, were converted into a means of recreation and amusement.

In reference to modern times, the reader will find in the work a detailed description of the Rural Sports of Great Britain and Ireland, as well as of all Foreign Countries, comprehending those of Racing, Coursing, Shooting, Hunting, Hawking, Fishing, &c.; nor have the Athletic Exercises of the British Isles been omitted.

It may be added, that the Foreign Sports, hitherto in a great measure untouched ground, form a new and important feature of this work.

A succinct but accurate sketch of the Natural History, Anatomical Structure, Physiological Peculiarities, and Geographical Distribution of the chief Animals of the Chase, has been given. The Natural History of the Horse, also, embracing every variety in use among Sportsmen; his Breeding, Rearing, Breaking, and Training; his proper Treatment in the Stable and in the Field; the important subject of "summing the hunter"; the effective methods of bringing Horses into Condition, and of keeping them in that state; the Management of the Feet, both in a Healthy and Diseased Condition; the Varieties of Shoes worn, and the proper Methods of Shoeing, have been fully discussed. The Treatment of Dogs, too, both in Health and Sickness, and particularly these two capital Sources—"Distemper" and "Madness"—have engaged a considerable portion of attention.

In the Embellishments no expense has been spared to render the work both useful and highly attractive. Drawings have been executed by Alton, T. Landseer, Dicks, and other eminent Artists; and the Engravings on Wood by Branstetter. In conclusion, the Author ventures to express a hope that the novelty and comprehensiveness of his plan, and its accuracy of execution, will secure for it a permanent place in the public favour.

* * * The Work will be published in Ten Monthly Parts, price 5s. each, commencing Oct. 1, 1839.

LONDON: LONGMAN, ORME, BROWN, GREEN, AND LONGMANS.

THE BRITISH ASSOCIATION.

NINTH MEETING: BIRMINGHAM.

In our last two *Gazettes* we briefly announced the preparations made for the reception of the British Association at Birmingham, and the general arrangements for the business of the Sections. On our arrival we found that every possible facility was given for the usual routine; furnishing members with their tickets, electing new candidates, pointing out lodgings, and all the other conveniences which contribute so much to the ease of strangers, and to the promotion of the objects in the view of the Association. The same good order prevailed through the usual influx and bustle of Monday; so that we may truly say, experience has enabled the system to work well. Its complicated machinery has been happily reduced at Birmingham to something like steam-engine precision and regularity.

With regard to the political aspects of the town, which caused some apprehension a few weeks ago, there is nothing apparent to attract the attention of visitors. The houses burnt at the Bull-ring are, it is true, melancholy memorials of the past; and the remains of placards posted off the walls, offering rewards for the discovery of the guilty, or stating that the Riot Act has been read, are sad reminiscences of a deluded period. There is, moreover, a degree of gloom which has succeeded the painful excitement; and the general mind of the inhabitants seems to be more engrossed with questions of politics and local rule than can be conducive either to the interests of trade or to individual comfort and happiness. A debating corporation is, we fear, a poor substitute for a guild of merchants or a chamber of commerce. National politics are bad enough to engross a people; but local politics are a curse *par excellence*!

We shall inflict no further mention of them upon our readers; but simply observe, that on Sunday the entire population moving abroad, including the poorer classes, looked to us to be decently and respectably clothed, and well-fed. We saw no rags or other signs of squalid misery.

At three o'clock on Saturday the General Committee of the Association met, to the number of about sixty; Mr. Vernon Harcourt, the president, in the chair. The Marquess of Northampton, one of the vice-presidents, was also present; the Earl of Dartmouth was not; and of the other two, Mr. Corrie was lost to the meeting by death; and we were sorry to hear that indisposition prevented the attendance of Dr. Robinson, of Armagh.

The Report of the last meeting of the Committee at Newcastle was read by Professor Phillips, and agreed to.

Mr. Yates read a Report from the Council. It stated it to be thought inexpedient to add to the permanent property of the Association; now amounting to 5500*l.* 3 per cent. consols. It noticed the proceedings of a deputation sent to London to ascertain if any danger could be apprehended, or any circumstances connected with the late riots, which might render it advisable to postpone the meeting; and congratulated the members on the fact, that no

change was deemed necessary. It then adverted to the following matters to be brought before the Committee:—

I. The Requisition presented at Newcastle for the establishment of a distinct section for Agricultural Science.
II. Mr. Kingsley's motion for the arrangement of the business of the Association.

III. The following Rules, which are recommended for adoption by the Council:—

1. That an admission-fee of 1*l.* be required from all future members admitted as annual subscribers, in addition to their annual subscription of 1*l.*; the composition of life-members to remain at 5*l.*

2. That every member, new and old alike, have the option of paying 5*l.* as a fixed *Book-subscription*, entitling him to receive a copy of the volumes published after the date of such subscription.

3. That all recommendations of grants of money, requests for special researches, and reports on scientific subjects, be submitted to the Committee of Recommendations, and not taken into consideration by the General Committee, unless previously recommended by the Committee of Recommendations.

The Report was ordered to be received.

The Marquess of Northampton, after paying a compliment to his services to the Association, moved that Mr. Francis Baily be appointed a trustee in the room, we believe, of Mr. Babbage, resigned; which being seconded by Mr. Hutton, Mr. Baily was elected.

Professor Phillips then rose to propose the adoption of the three Rules recommended by the Council, as above. In support of the *first*, he urged that the extreme easiness of access led to the casual enrolment of so great a multitude, as to lead to serious embarrassment and confusion in every part of the arrangements. The increased provision to be made for the accommodation of ladies, a consequence of these numbers, was another source of much inconvenience. Again, it tendered the Association a more fluctuating body than it should be: so many persons attending once, and taking no further concern or interest in their proceedings. It was like paying a price to hear a few lectures or discourses; and he trusted, that by adopting this rule the meetings would become both more manageable and stronger.

Mr. Murchison seconded the motion, which was carried *non. con.*

Professor Phillips then moved the *second* Rule, from which he anticipated that the publications of the Association would be supplied with less difficulty and more immediately to members; which last was very much to be desired, in consequence of the papers containing accounts of the state of science to the existing time being so useful to persons engaged in scientific pursuits.—Agreed to.

The Marquess of Northampton moved the *third* Rule, which would tend to the saving of much valuable time, and perhaps of some disagreeable discussions. To many propositions offered for their consideration there might be objections of so delicate a nature as to unfit them for being submitted to a public meeting. They might be like gunpowder thrown in, and at the risk of explosion. Should this rule pass, the worst that could happen was that two or three objects might not be taken up; and this bore no comparison to the advantages that must accrue from it. If any members objected to the Committee of Recommendations, it was competent to them to move the nomination of other individuals, but at all events the proceedings ought to emanate from that body.

[This Rule in reality makes the Committee of Recommendations the executive of the Association; and the more anomalous body, called the General Committee, little else than the registrars of their acts.—Ed. L. G.]

Dr. Yelloly seconded the motion, though the Society had gone on well during eight years without it; and he proposed, to add, as a rider, that one member of every Section should be allowed to attend the Committee of Recommendations, in order to explain the grounds on which the Section wished certain things to be done, and to vote on that subject.

This led to a long and uninteresting discussion, which ended in the original motion being carried and amendments negatived.

The whole debate arose out of a presumed disregard of a wish, of the Medical Section at Newcastle, to have the American gentleman with a hole in his side brought over for inspection, that we might learn how food was digested, and other functions, in the economy of nature, performed (See *Literary Gazette* on the subject; and, previously, with a full description of this individual and his remarkable condition).

Proposed Section of Agriculture.—The numerously signed requisition, for forming a Section on Agricultural Science, was read; but Dr. Yelloly, in the absence of Dr. Granville, withdrew the proposition, which he was not prepared to enforce.

Mr. Kingsley also, instead of proposing his resolutions respecting the arrangement of business, seeing that some of them had been already acted upon, agreed to lay them in the shape of suggestions before the Council.

Professor Phillips observed that they were always ready to adopt such hints as could be beneficial to the arrangements.

Lists of officers, &c., were then read, but as they were subsequently added to and altered, we shall omit them till Monday.

The meeting adjourned to Thursday at three o'clock.

At ten o'clock on Saturday night, 168 non-resident members were enrolled; and a very correct list, with their addresses, &c., circulated in the morning. Much credit is due to the local secretaries and their assistants, for their exertions in this and all the other business they have had in charge.*

MONDAY.

This morning, in due time, the Sections were constituted; and, after considering the alterations rendered necessary by the non-appearance of several officials, elected to various situations, the following list was given out of the presiding officers, &c., for the present Meeting:—

SECTION A.—Mathematics and Physics.

Steward—Rev. J. Abbot. President—Rev. Professor Whewell, F.R.S. Vice-Presidents—Francis Baily, Esq. F.R.S., Professor Forbes, F.R.S., Major Sabine, F.R.S. Secretaries—J. T. Chance, Esq., W. Snow Harris, Esq. F.R.S., Professor Stevelly.

* The Committee of Recommendations, in whom, as we have observed, the executive power of the Association is lodged, was read by Mr. Murchison, as follows:—The Marquess of Northampton, Sir Charles Lemon, Bart., Dr. Buckland, Professors Daubeny, Forbes, Graham, Mr. J. E. Gray, F.R.S., Mr. G. B. Greenough, Mr. H. Hallam, Dr. Hodgkins, Mr. Hutton, M.P., Mr. G. R. Porter, Professors Lloyd and Lyell, Dr. Roger, Mr. Fox Talbot, Professors Willis, Whewell, and Wheatstone, and Dr. Yelloly, together with the President *pro tem.*, the Vice-Presidents, the General Treasurer, Secretaries, and other Officers.

SECTION B.—*Chemistry and Mineralogy.*

Steward—Dr. Melan. President—Professor Graham, of London, F.R.S. Vice-Presidents—Professor Johnstone, F.R.S., Richard Phillips, Esq. F.R.S. Secretaries—Golding Bird, M.D. F.R.S., J. B. Melan, A.B. M.B.

SECTION C.—*Geology and Physical Geography.*

Steward—John Francis, Esq. President—Rev. William Buckland, D.D. Vice-Presidents—For Geography, G. B. Gresham, Esq. F.R.S. For Geology, H. T. De la Bèche, Esq. F.R.S., Leonard Horner, Esq. F.R.S., Charles Lyell, Esq. F.R.S. Secretaries—G. Lloyd, M.D. F.R.S., H. E. Strickland, Esq. F.G.S., C. Darwin, Esq. F.R.S.

SECTION D.—*Zoology and Botany.*

Steward—W. D. Crompton, Esq. President—Professor Owen, F.R.S. Vice-Presidents—J. E. Gray, Esq. F.R.S. P.B.S., Dr. Graham, F.R.S.E., G. B. Daubeny, M.D. F.R.S. Secretaries—E. Forbes, Esq. M.W.S., Robert Patterson, Esq., William Ick, Esq.

SECTION E.—*Medical Science.*

Steward—Dr. Eccles. President—Dr. Yelloly, F.R.S. Vice-Presidents—Dr. Johnstone, Dr. Roget, Sec. R.S., Dr. Macartney, F.R.S. Secretaries—Dr. G. O. Rees, F. Ryland, Esq.

SECTION F.—*Statistics.*

Steward—Frederick Russell, Esq. President—Henry Hallam, Esq. F.R.S. Vice-Presidents—Sir Charles Lemon, Bart. M.P. F.R.S., G. R. Porter, Esq. F.R.S. Secretaries—Francis Clark, Esq., Rawson W. Rawson, Esq., W. C. Taylor, Esq. LL.D.

SECTION G.—*Mechanical Science.*

Steward—William Hawker, Esq. President—Professor Willis, F.R.S. Vice-Presidents—Robert Stephenson, Esq., Dr. Lardner, F.R.S., G. Rennie, Esq. F.R.S. Secretaries—William Carnall, Esq., W. Hawkes, Esq., T. Webster, Esq. Sec. Civ. Eng.

The business of the various Sections posted up by their committees for this day, afforded a fair promise of the matters which were likely to occupy the meeting.

SECTION A.—*Mathematics and Physics.*

1. Sir J. Herschel, respecting the 'Reduction of Stars in Lacaille's *Cœlum Australe*.'

[Professor Stewelly, the secretary, read this Report, for which 200*l*. was granted last year. It stated that considerable progress had been made, and only a small portion of the grant expended. The rest would be required in the course of next year.]

2. Sir J. Herschel's 'Report on the Revision of the Nomenclature of Stars.'

[A similar grant of 50*l*. to Sir John, Professor Whewell, and Mr. F. Baily: in which also some progress had been made in the northern hemisphere. The laying down of the stars in the southern hemisphere on a planisphere had been commenced. No expense had been incurred, and application was made for a continuation of the grant.]

3. Mr. Baily's 'Report on the Reduction of the Stars in the *Histoire Céleste*.'

[Here also, in making progress, 13,000 stars had been reduced, and 150*l*. of the grant expended. The whole was expected to be concluded next year.]

4. Mr. Baily's 'Report on the Extension of the Royal Astronomical Society's Catalogue of Stars.'

[Partly completed; 150*l*. expended; and the completion expected next year.]

5. Professor Lloyd, 'On Placing Three Magnets in an Observatory.'

Professor Lloyd observed, that the phenomena of terrestrial magnetism could not be determined by one magnet. His researches had, therefore, been directed to ascertain the best position of three magnets, so as in the least degree to affect each other, and ascertain this problem. The learned Professor then went into a demonstration of the fundamental theorem included in this proposition, and gave a formula, which he illustrated by diagrams on the board beside him; and of which we give the substance. One magnet should be placed in the line of the magnetic meridian, and is termed the declination magnet; the second, perpendicular to it, representing the horizontal force; and the third, representing the vertical force, at the angle opposite the base of the other two. The limits of distance can, at present, be determined by experiment only. By the positions of these three magnets, we have four indeterminate arbitrary angles, by which we are enabled to fulfil four equations of conditions; and thus the relative action is rendered nothing, and

the mutual action of the three magnets destroyed. A gallery of about forty feet in length is most practically convenient for the placing of the three magnets. The result arrived at by Professor Lloyd is exceedingly interesting, in relation to the observatories about to be erected in the British colonies, and to the solution of the difficult problem of terrestrial magnetism.

6. Sir D. Brewster's 'Report of Hourly Meteorological Observations at two Stations in Scotland.'

[This Report recorded the daily variations of the temperature; and mentioned an extraordinary aurora borealis, 27th Nov. 1838; at which time there was a remarkable depression of the barometer, which stood at 27.2, seven hundred feet above the level of the sea. A conversation upon the aurora, and this general depression of the barometer, ensued, but led to no conclusion. Mr. Whewell noticed a curious Japanese picture, which he thought represented this phenomenon at a remote period. These were radiations from the centre of a circle. He also stated, that the subject connected with the aurora borealis had excited much interest at Utrecht.]

7. Letter from Professor Bache of Philadelphia, respecting his 'Meteorological Report.'

The Professor was not ready with his report, owing to a *tangle* in the state—indisposition, and being occupied with preparing his "Tour in England;" but he hoped to send it next year. The latter portion of his letter referred to rain-gauges, magnetic arrangements, &c. This led to a long gossip about rain-gauges, such as we reported from Newcastle; and the general impression (sanctioned by Professor Foster) was, that the best position for a rain-gauge was a square hole cut in a horizontal surface of the earth.

8. Dr. Daubeny, 'On a Sub-registry Photometer.'

The rough model of this instrument was exhibited. It depended upon a simple principle, which he hoped would be explained by Mr. Fox Talbot, and that it might form an appendage to that gentleman's paper. The model was of glass and wood, enclosing ammonio-bulphate of copper, through which the solar rays passed, acting upon photogenic paper, whereby their intensity was measured all day, and each hour. The paper travelling on rollers, caused each portion to be acted upon, as exposed, and become more or less discoloured. The effect was reduced to a scale, and marked off by a common mechanical process.

Professor Forbes observed, that considerable mechanical difficulties presented themselves; and otherways objected to a dependence upon such an instrument.

9. Mr. Fox Talbot's 'Remarks in reference to M. Daguerre's Photogenic Process.'

Mr. Talbot offered a few extempore remarks on M. Daguerre's photogenic process. M. Arago had declared, that optics and chemistry united were insufficient, in their present state, to give even any plausible explanation of this complicated process. If M. Arago, who had the advantage of being for six months acquainted with the secret, was of this opinion, it seemed as if a call were made on all the cultivators of science to use their united endeavours, by accumulating new facts, to penetrate into the real nature of these mysterious phenomena. For this reason, Mr. Talbot said, he would offer to the Section a small contribution, on his part, of new observations, which might, perhaps, be of service towards the elucidation of this new branch of science.

The first part of M. Daguerre's process consists in exposing a silver plate to the vapour of iodine, by which it becomes covered with a stratum of iodine of silver, which is sensitive to light. Mr. Talbot stated, that this fact had been known to him for some time, and that it

formed the basis of a curious optical phenomenon; which, as it did not appear to have been observed by M. Daguerre, he would describe to the meeting.

Place a small particle of iodine, the size of a pin's head, on a plate of silver, or on a piece of silver leaf, spread on glass: warm it very gently, and you will shortly see the particle become surrounded with a number of coloured rings, whose tints resemble those of Newton's rings. Now, if these coloured rings are brought into the light, a singular phenomenon takes place. For the rings prove to be sensitive to the light, and their colours change; and, after the lapse of a short time, their original appearance is quite gone, and a new set of colours have arisen to occupy their place. These new colours are altogether unusual ones; they do not resemble any thing in Newton's scale, but seem to conform to a system of their own. For instance, the two first colours are *deep olive green*, and *deep blue, inclining to black*, which is quite unlike the commencement of Newton's scale. It will be understood, that the outermost ring is here accounted the first, being due to the thinnest stratum of iodide silver, furthest from the central particle. The number of rings visible is sometimes considerable. In the centre of all the silver leaf becomes white and semi-transparent, like ivory. This white spot, when heated, turns yellow; again recovering its whiteness when cold: whence it is inferred to consist of iodide silver, in a perfect state. The coloured rings seem to consist of iodide silver, in various stages of development. They have a further singular property, which, however, has not been yet sufficiently examined into. It is as follows: it is well known that gold leaf is transparent, and transmits a bluish-green light; but no other metal has been described as possessing coloured transparency.

These rings of iodide silver, however, possess it, being slightly transparent, and transmitting light of different colours. In order to see this, a small portion of the film should be isolated, which is best done by viewing it through a microscope. Mr. T. said, that he had considered the possibility of applying a silver plate, thus combined with iodine, to the purpose of photogenic drawing; but he had laid it aside as insufficient for that purpose, on account of its sensitiveness appearing to be much inferior to that of paper spread with chloride of silver; and therefore in an equal time it takes a much feebler impression. Now, however, M. Daguerre has disclosed the remarkable fact, that this feeble impression can be increased, brought out, and strengthened at a subsequent time, by exposing the plate to the vapour of mercury.

The next point of M. Daguerre's process is this exposure to vapour. And this is by far the most enigmatical part of the whole process. For he states, that if you wish to view the picture in the usual manner, that is, vertically; you must hold the plate inclined to the vapour at an angle of 45° (and *vice versa*). Now, this is something extraordinary; for whoever heard of masses of vapour possessing determinate sides, so as to be capable of being presented to an object at a given angle?

From the hasty consideration which he had been able as yet to give to it, his first impression was, that this fact bore a certain analogy to some others which he would mention.

If a piece of silver leaf is exposed to the vapour of iodine, however uniform the tension of the vapour may be, yet it does not combine uniformly with the metal, but the combination commences at the edge of the leaf, and spreads inwards, as is manifested by the formation of

successive coloured bands parallel to the edge. This is not peculiar to silver and iodine, but occurs when other metals are exposed to other vapours, not always with much regularity, but displaying a tendency to combine in this way. A possible explanation is, that this is due to the powerful electrical effect which the sharp edges and points of bodies are known to possess: in fact, that electricity is either the cause or the attending consequence of the combination of vapour with a metallic body. Again, if a minute particle of iodine is laid on a steel plate, it liquefies, forming an iodide of iron, and a dew spreads around the central point. Now, if this dew is examined in a good microscope, its globules are seen not to be arranged casually, but in straight lines along the edges of the minute striæ, or scratches, which the microscope detects even on polished surfaces. This is another proof how vapour is attracted by sharp edges, for the sides of these striæ are such. Whether or not these facts had any relation to that observed by M. Daguerre, of the action of vapour at an angle of 45°, Mr. Talbot did not pretend to say, but thought them worthy of being mentioned to the Section.

It had been repeatedly stated in the "Comptes Rendus" of the French Institute, that M. Daguerre's substance was greatly superior in sensitiveness to the English photogenic drawing-papers. Now, however, it appeared that this was to be understood in a certain peculiar sense, inasmuch as the first or direct effect of the French method was very little apparent, and was increased by a subsequent process. This rendered it difficult to institute a direct experimental comparison between them. If it could be accomplished, he doubted whether M. Daguerre's substance would be found much more sensitive than his. The present degree of sensitiveness of the photogenic drawing-paper was stated to be as follows:—It will take an impression from a common Argand lamp in one minute, which is visible though weak; in ten minutes' time, the impression is a pretty strong one; in full daylight, the effect is nearly instantaneous.

Mr. T. then mentioned a kind of photogenic pictures which afford a very capricious phenomenon. The objects are represented of a reddish colour on a white ground, and the process leaves the pictures in such a state that they can neither be said to be *fixed*, nor the contrary, but are in an intermediate state: that is to say, that when they are exposed to sunshine they neither remain unaltered (as *fixed* pictures would do), nor are they destroyed (as *unfixed* pictures would be). But this singularity occurs, that the white ground remains unaltered, while the colour of the object delineated on it changes from reddish to black with great rapidity, after which no further change occurs. These facts may serve to illustrate the fertility of the subject, and shew the great extent of yet unoccupied ground in this new branch of science.

SECTION B.—Chemistry and Mineralogy.

The Papers announced in this Section were:—

1. Professor Hare, 'On the Preparation of Metallic Bases of Earth.'
2. Dr. Mackay, 'On a Bark from South America.'
3. Mr. Mallet, 'Observations on the Action of Sea Water on Iron.'
4. Mr. Harris, 'On some Phenomena of Colour in Glass.'
5. Coathorpe, 'On the Mode of Graduating Glass Tubes.'

[Two other papers postponed.]

SECTION C.—Geology and Physical Geography. Dr. Buckland in the Chair.

1. Dr. Buckland's 'Report on Agassiz's Work on Fossil Ichthyology.'
2. Mr. Lyell, 'On Tabular Cavities in Chalk, near Norwich.'
3. Mr. J. D. Marshall, 'On Section of Silurian Rocks in Westmorland.'
4. Dr. Buckland, 'A Communication from Mr. Oram, on the Applicability of Small Coal to Steam Navigation.'

The Geological Section has been attended with its former popularity at this meeting; and its discussions have been of a very interesting character.

Before proceeding to the business on the list, the chairman called the attention of the meeting to a communication from a public association of the town of Bradford, recommending that local museums should be formed for the collection and preservation of such specimens as occurred in their own neighbourhoods. This he observed was a commonsense view of the matter, and could not emanate from a fitter place than from Bradford; which, like Birmingham, was seated on those enormous remains of ancient vegetation which had raised them from the rank of petty villages to the high commercial and manufacturing importance which they now enjoyed. The same course had been already pursued at Newcastle, and the members who had visited that town last year, had seen how valuable the results had been. Strangers visiting such museums would at once see what the country contained, and learn, without further trouble, what to seek and where. It was properly recommended to keep distant products separate and apart from those of the localities where the museums were established, and he (the chairman) was of opinion that too much attention could not be paid to this excellent suggestion.

Mr. Greenough, before proceeding to the business of the Section, took the opportunity to express his gratitude to the French government for having, ten years ago, formed a national collection of this kind, arranged in departments. Nothing could be more desirable than to form topographical museums; and he regretted that the example of France had not been followed in the British Museum. He trusted that this reproach would soon be removed, and in the meantime that local collections would be encouraged. Whilst on the topic he would merely observe, that heretofore fossil remains had been too little considered in reference to their localities. In looking for them according to the strata in which they were discovered, the varieties found in different parts had been rather overlooked.

Mr. Murchison was warmly thanked for his liberality in allowing a portion of his great map to be copied, for the use of the excursion appointed for Friday.* It will certainly

* It has been arranged as follows, and much gratification is anticipated from it:—

Division A.—*Iron Works, &c.*
Leaves Birmingham at half-past seven A.M., and disembarks at Tipton Green, for the Horsley Iron Works, Tipton; from thence to the Works of Messrs. Bradley, Barrows, and Hall; and after that, if time will permit, to the Castle Hill and Lime Caverns.

Division B.—*Rowley Hills and Trap Rocks.*
Leaves Birmingham at eight A.M.; disembarks at the Brades Canal Branch, and proceeds to the Trap Formations at Rowley Hills, Pearl Hill, Bare Hill, and Tansley Hill; and from thence to the Limestone Formations at the Castle Hill, if time permit.

Division C.—*Caverns and Lime Formations.*
Leaves Birmingham at half-past eight A.M., and disembarks at Tipton Bridge; then proceeds by Mr. Bradley's Lodge to the Lime Caverns; and from thence to the Wren's Nest.

The above divisions will leave punctually at the time fixed, by boats, from Messrs. Shipston's wharf, in Broad

help much to the enjoyment of the remarkable Limestone Caverns.*

The Marquess of Northampton, as an *ex officio* trustee of the British Museum, whilst he highly commended the plan of local and national museums, stated that there was as yet no room for the former in the museum. For the present they could only have a general collection. He trusted, however, that this difficulty would be removed, and one of the greatest interest and variety be attached to the metropolis.†

Dr. Buckland now came to the first paper of the Section, and expressed his regret that M. Agassiz was not able to attend the meeting to express the gratitude he felt for the patronage he had received in the prosecution of his splendid work, not only in grants from the Association, but from the subscriptions of individual members, in consequence of which he had been enabled to carry it on. The learned Chairman spoke highly in praise of this work (on Fossil Fishes), the price of which was 25*l.*; and which must have stopped but for the assistance given to its author by the Association; and well did he merit that assistance. He had relinquished pursuits from which he might now have been in the receipt of a considerable income, and all for the sake of science. He had known him, when engaged in this arduous career, with the revenue of only 100*l.*; and of this he paid 50*l.* to the artist for drawings, 30*l.* for books, and lived himself on the remaining 20*l.* a-year! Thus had he raised himself to an elevated European rank, and in his abode, *au troisième*, was the companion and friend of princes, ambassadors, and men of the highest rank and talent of every country.

There were now published Parts 10 and 11; and in three or four more M. Agassiz's magnificent production would be complete. (Professor Buckland held up some of the plates, which were beautifully executed.) These they owed to the talent of M. Agassiz, and to the encouragement he had received from the British Association. His system could not be too highly estimated. It was founded, not on internal structure, which was so perishable, but on those external appearances which, from their nature, were calculated to endure from ages so remote, and be submitted to geological inspection and investigation. Men and women born naked, and so soon accustomed to think more of clothing than of their own natural covering, were not apt to pay so much attention to this important subject as it deserved. But to eels, for example, it was of vital interest. Had any one of his auditory ever seen scales of an eel?

[No answer for a time—when Dr. Lloyd, of Leamington, one of the Secretaries, said, "I have."]

Then, continued the speaker, there is one gentleman present who has seen the scales on an eel. It is a fortunate circumstance, for he will bear witness to the fine provision in its external economy, covered with minute scales,

Street. Those Members who are too late for the boats to which they belong, cannot be conveyed by any others. Non-resident Members are requested to make immediate application at the Inquiry Room for tickets, as the lists will be closed on Tuesday, the 27th inst., at four o'clock P.M. Resident Members are requested to enter their names immediately, as the remaining seats in the boats will be allotted to them in the order of application. None but Members of the Association will be permitted to apply for excursion tickets, the price of which is 2*s.* 6*d.* including a ticket for a cold dinner at Dudley.

* The local publisher has, however, put on a screw, in charging 2*s.* for what ought not to have cost above 6*d.* † In the meantime, might we suggest the expediency of public encouragement being given to Newcastle, Bradford, and other provincial establishments; on the condition of preserving duplicate specimens for the National Museum? The interchange of local duplicates, one place with another, ought to be arranged on a liberal footing. It would enrich all, and impoverish none.—Ed. L. G.

and having diffused over them a quantity of slimy mucus, under which, being concealed, they were admirably adapted for that mode of life which consisted of imbedding themselves in mud, or penetrating under stones and rock. But this was a slippery subject, and he would leave the eels with their pilot coats on to proceed with the rest of the Report. One very curious result remained to be noticed. There were but four great dispositions of scales in all the species of fish now living; and of these, two belonged to classes whose formation was traced to the later geological strata. Below, in the oolite, sandstone, slate limestone formations, their character was totally distinct from the more recent, in chalk and the superincumbent strata. In the former, their scales of enamel, or enamel upon bone, were so imperishable, that they had resisted destruction, whilst the bones, and all other parts, except the teeth, had decayed in the lapse of centuries of time. He regretted to say that, in regard to the teeth, a sudden indisposition had deprived the Section of the presence of Mr. Owen, whose researches had made him so perfect an authority on every thing connected with these organs. Their microscopic forms had been so minutely examined and ascertained by that gentleman, that he could almost at a glance decide to what animal, existent, or no longer existent, they belonged; and he trusted that by Saturday Mr. Owen would be sufficiently recovered to be able to communicate to them some of his vast fund of information on the subject. The Professor then playfully alluded to the ornaments which could be manufactured from these remains, and recommended them to the ladies; but returning to M. Agassiz's system, he observed, that it furnished a new key to the early conditions of the earth, and shewed the course in which the Creator had created new animals as that earth became fitted for their reception. It unfolded the progress of organisation of vertebrate beings; in which the traces of fishes were of so much value. This we owed to M. Agassiz, who being able to detect and pursue these traces at a period anterior to the *Mammalia* of Cuvier, went deeper below the surface of the globe and its later inhabitants, and laid before us the secrets of ages long before these had existence.

The learned Professor concluded by recommending M. Agassiz's work, not only for its own importance, but as only a limited number had been printed, on account of its rarity.

A Member stated that he had made a collection of fossil fish in the neighbourhood of Manchester, which he would communicate at a future day.

Dr. Buckland mentioned, that after to-day the gallery round the Section-room would be appropriated to ladies, and that if he saw any below he would call upon them for speeches.

[This threat, however, he did not execute on after-days, when a few privileged ladies were introduced into the body of the room.]

2. The second paper was by Mr. Lyell, 'On the Pipes or Tubes of Gravel found in Chalk;' and it was of such interest as to afford the principal topic of discussion and observation on this and the ensuing day.

Mr. Lyell directed their attention to this condition of these strata, as exemplified at a locality about two miles west of Norwich. Here, as shewn by a diagram, pinned up in the Section-room, a bed of gravel lay over the deep chalk formation, and penetrated it in nearly perpendicular pipes or tubes, of various lengths and widths. They tapered like carrots. Some were three or four feet in diameter, and pene-

trated five, eight, or ten feet; others were from twelve, to above twenty feet wide at the upper part, and descended to their points, forty, sixty, or more feet. These pipes were filled with gravel, sand, or clay, the same as the horizontal strata above. They contained no fossil remains that he had discovered; and he referred their age to that of the Norwich Crag. One remarkable fact was, that the sides of these pipes were lined almost continuously with a fine clay, nothing similar to the materials, the gravels and pebbles, which filled up their centres, and appeared evidently to have been precipitated from above, slowly and gradually after (probably at a much later period) the openings in the chalk had been made to receive them. The horizontal nodules of flint, which crossed the chalk, were found in the wider pipes to have fallen through them, and below the line which they occupied in the chalk. They never arrived at the bottom; and this was another proof of the gradual descent of the gravel, &c., which had so far filled and arched the pipes, that heavier bodies were thus intercepted as they were disengaged from the chalk. The chalk on the edges of the pipes was in a most decomposed state, and slightly discoloured, of a yellowish hue, as if from clay and sand, and extending to the distance of from one to five feet.* His explanation of these appearances was, that the cavities in the chalk were first formed by chemical action; and at, perhaps, a long subsequent period, gradually filled up as they now appeared. The first operation might either have been effected by water from above, charged with carbonic acid, or by the action of carbonic acid passing upwards, either with springs or in vapour. He considered that the clay lining was the last portion of the formation; and stated that it contained no calcareous matter whatever. A thicker layer of it was found at the bottom of the pipes. He confessed that there were difficulties opposed to his theory, which seemed to rely most on the ascent of carbonic acid in springs; but he had brought the subject fairly under the observation of the Section.

Mr. De la Bèche observed, that there were similar irregularities on the upper surface of green sandstone, but they did not penetrate to any depth. He agreed with Mr. Lyell that these tubes had their origin in chemical action; and attributed them to the descent of rain-water, charged with carbonic acid. Every well in the upper gravel would receive a supply of this from every shower, which, sinking through it, would form carbonate of lime, and readily account for the descent of the pipes to points of various extent. He also agreed that the formation of the cavities, and their filling up, must have belonged to different periods. The argillaceous lining he could not explain.

Professor Phillips remarked on the importance of this communication, and the examination of similar phenomena, not only in lime formation, but in oolitic rocks. He thought it possible that the fissures might have been begun by mechanical action, and completed by chemistry.

The Chairman said this subject had occupied his attention ten years ago, but had, like many others, been indefinitely postponed, as he was occupied with different pursuits. He would, however, bring certain drawings with him tomorrow, and propound his theory on these appearances. Every chalk formation exhibited

* This part of the appearance, and that of the fine clay lining, was afterwards much discussed. Might it not arise from an infiltration of the materials of the pipes, through the adjacent chalk? The finer particles would pass through and discolour it, whilst those a little more gross would form the lining.—Ed. L. G.

the same pipes or tubes. Some of them were enormous. Between High Wycombe and Oxford, and all along the sea-shore of England, and in Normandy, they might be studied. At Shottouer (as we understood him), they occurred in the oolite; also in the Kimmeridge clay over Chert and at Caen.

Mr. Yates described the organ pipes at Maestricht; similar fissures shewn to travellers there, and so called from their resemblance to the musical instrument. These did not terminate in points at their lower extremities, and many of them were empty. His opinion inclined to their having been produced by action from below.

Mr. Lyell terminated the discussion by expressing his satisfaction at the general concurrence of opinion in the Section, and which was opposed to that of M. Passy on these phenomena in Normandy. He was convinced that the fine clay lining was not at all derived from the chalk. He would then ask where the chalk removed from the cavities had gone, if precipitated from above? If they held that the action proceeded from below, this difficulty would vanish.

SECTION D.—Zoology and Botany.

1. Mr. Lankester, 'On the Formation of Woody Tissue.'

2. Mr. Forbes and Mr. Goodsir, 'Notices of Zoological Researches in Orkney and Shetland.'

3. Dr. Wilde, 'On the Preparation of Fish, and Models and Drawings of a Mummy brought from Peru.'

4. Mr. Lankester, 'On the Preparation of Fish.'

1. Mr. Edwin Lankester, of Campsall, near Leeds, read the first paper in the list, 'On the Formation of Woody Tissue.' He began by enumerating the principal tissues, and tracing the origin of the whole to the simple cell. He thought this fact was lost sight of in the theories of the formation of wood. The development of this tissue had been ascribed to the leaves by Du Petit Thouars, and to the bark and wood by other observers. The former view was supported by Dr. Lindley. The author objected to the theory of the formation of wood from buds or leaves. I. Because hardened, elongated tissue, is found in Cryptogamia; in leafless Endogaeus; in the pericarps peduncles, &c. of Phanerogamous plants, where there are no leaves; in leafless Exogaeus, as *Monotropa* and *Cactaceae*; and in the knots of beech-trees, which Du Petit Thouars calls *Embryo-buds*. The author entered into a lengthened account of these bodies, and thought the following conclusions were all that could be asserted in the present state of our knowledge:—I. That the requisites for the formation of wood are a living tissue, developing elongated fibres; 2. A tissue, forming and depositing secreted matter; 3. exposure to the influence of external stimuli. II. That the secreted matters are more easily brought under the influence of external stimuli in the youngest tissues, hence the importance of leaves. III. That neither bark nor leaves are essential to the formation of woody fibre. The paper was accompanied by a number of specimens.

Mr. Babington thought Mr. Lankester's conclusions correct, and could confirm the accuracy of his remarks on the embryo buds. The fact of a stock forming its own wood, whilst a graft formed its own, he thought tended to refute Du Petit Thouars's theory.

Dr. Boosey had heard the paper with interest, as he had long been of opinion that facts were opposed to Du Petit Thouars's theory. He

would mention the oriental plane, which shed its bark from increase of wood; this it did in the centre of the tree, and not at the top, as it would do, if this theory were true.

2. Mr. Forbes then read his paper 'On some new Animals he had discovered off the Coast of Shetland.' He enumerated and described thirty new species of invertebrated animals, which he had discovered. Amongst others, a very interesting polypus, standing between the genera *Coryne* and *Tubularia*, and which he proposed to call *Ellisia*.

Mr. Gray objected to the name *Ellisia*, as it had been already applied by Dr. Brown to a plant.

3. Dr. Wilde made some observations 'On the Mummy brought from Peru.' It was peculiar in being doubled up, and having a blue net thrown over its body.

Dr. Macartney, of Dublin, referred to its anatomical peculiarities. The intestines were emptied of their contents, and other parts of the preparation were of a singular nature.

4. Mr. Lankester then read the paper 'On the Preparation of Fish.' His mode demanded attention, on account of the ease with which it might be done. The side and interior of the fish were removed, and the skin allowed to dry in a proper shape by pieces of cork being placed inside, and then on being placed on paper they assumed their original form. (The specimens exhibited were most natural and beautiful.)

This paper led to a long and interesting discussion on the various modes of preparing animals for museums, in which Dr. Macartney, Mr. Wilde, Mr. Gray, and other naturalists, took part.

SECTION E.—Medical Science.

1. Cases, by Sir D. Dickson, 'On the Rupture of the Duodenum,' &c.

2. Mr. Middlemore, 'On the Treatment of Capsular Cataracts.'

[These papers do not admit of popular illustration in a Journal like ours; and we shall probably take a view of this Section altogether at the end of the week, with the exception of any papers of a nature to interest the general reader.]

SECTION F.—Statistics.

1. 'Contributions to the Educational Statistics of Birmingham.'

2. Mr. G. Porter, 'On the Collection of Agricultural Statistics.'

3. The Manchester Statistical Society's 'Report on the Condition of the Working Classes of Rutlandshire.'

[Abstracts of these Reports will be given hereafter.]

SECTION G.—Mechanical Science.

1. Mr. Hawkins, 'On Paving Roads and Streets with Blocks of Wood placed End upwards.'

2. Mr. Taylor's Report 'On the Duty of Cornish Engines.' (A money grant of 50*l.*)

3. Mr. Russell's 'Observations on the most Economical Proportion of Power to Tonnage in Steam-vessels.'

4. Dr. Lardner's 'Contrivance for detecting Inaccuracies in Lines of Railroad.'

1. Mr. Hawkins, 'On Paving Roads and Streets with Blocks of Wood placed End upwards.'—"The public attention being turned to the subject of paving roads and streets with blocks of wood, placed with the grain in a vertical position, the plan being highly spoken of for goodness and durability by many travellers, who have seen such roads abroad, and although seven patents have been taken out in England for wooden pavements in little more than a year past—there still being, I apprehend, no specimen in this country calculated to afford the means of forming a sound public opinion on this most valuable means of road-making—it is

desirable that those who have had opportunities of examining such pavements should contribute the results of their observations and inquiries, towards informing the public mind, and to guard it from being led to an unfavourable conclusion by two specimens very imperfectly laid down in London—one in Oxford Street, and the other in the Old Bailey. Having myself attentively watched for about four years, from 1827 to 1831, the effect of much travelling over a piece of wooden pavement, well executed, in the principal thoroughfare of Vienna, and observed that it appeared to wear away less than any other kind of paving material whatever, I frequently, after my return to England, in 1831, mentioned to our engineers the superiority of such roadways for carriages, and recommended their universal adoption; having also made inquiries of several persons, who have observed the condition of a piece of wooden pavement, laid about three years ago, in that very great thoroughfare, the Broadway, in New York, and been repeatedly informed that the execution of that piece was performed in a workmanlike manner,—the particulars of which have been stated to me—I am strengthened in my high estimate of the value of great attention to the goodness of the workmanship. One gentleman of acute observation informed me, that he saw a stone of near twenty tons weight drawn on a carriage over this piece of pavement, without appearing to make the least impression on it. Under these circumstances, I come forward as a disinterested advocate of this system of paving, in the full persuasion that sound wood, with the grain vertical, is the best material yet discovered for making good and durable roadways; and that roads formed of that material, well executed, may be made so even as to constitute a sort of universal railway, on which carriages may be drawn by a small proportion of horse-power, and on which steam carriages may be run as safely and almost as fast as on railways. Thus, finding myself in possession of valuable information and experience on this most economical kind of pavement, and having no connexion with any parties for carrying it into effect, I deem the Mechanical Section of the British Association the medium by which the public mind can be the most extensively informed; and therefore feel it my duty, in a concise manner, to state the points on which the goodness and durability of such roads will mainly depend. They are:—1. That the wood be chosen from the heart of sound trees, not a particle of sap being in any case allowed to be laid down, lest early rotteness be the result. The resinous firs offer excellent materials at moderate prices, where little land-carriage is required; but such durable woods may be employed as can be the easiest procured in the respective localities of the roads to be paved. 2. That the blocks, which are to be laid contiguously, be cut to an exact gauge, so as to fit closely and evenly together; and when placed side by side on a level floor, no block shall be visibly higher than another. 3. That the depth of the blocks be at least once and a half of the breadth, a firm lateral support being found necessary to stability; twice the depth of the breadth is to be preferred. Each block, when rectangular, is supported by four others; and when formed into hexagonal prisms, which appears to be the favourite form, each block is supported by the six surrounding ones; and this support will be the more effective in proportion to the accurate and tight fitting of the whole mass of blocks. The hexagonal prism being found to afford the greatest quantity of wood from a tree, when

the diameter of the prism is as large as can be cut out of the whole diameter of the sound part of the tree, that figure has been adopted in all cases which I have seen or heard of, as hitherto carried into effect; I shall therefore omit considering various other figures proposed, until specimens of them have been laid down and fairly tested by experience. 4. That the blocks be laid upon a bed firmly made with gravel, shingle, hard rubbish, or other hard material, well rammed down, and made even previously to laying the blocks. An excellent bed in New York was made of marble chippings, from a neighbouring statuary's yard. 5. That a thin layer, of only half an inch of fine gravel, be spread evenly over the rammed and levelled surface of the bed, at the time of laying the blocks, to favour their adjustment. 6. That the blocks be laid so as to present an even upper surface before any ramming of them is commenced, in order that the ultimate making them even shall not depend so much on the rammer as on the evenness of the bed; the use of the rammer being to settle the whole firmly down, no block should have to be rammed much more than the rest. If one block be allowed to remain higher or lower than the contiguous ones, a jolting of the carriages will take place; and the tendency of this jolting is, to depress the lower blocks more than the higher ones: and thus the evil, when commenced in the smallest degree, is found to be gradually growing worse; for the carriage wheel, when descending from the higher block upon the lower one acts as a rammer; but when ascending from the lower to the higher, it acts only as so much dead weight. In addition to the above essential points, it may be observed, that the blocks should be cut from dry wood, and used soon after being cut, lest their figure vary by warping; they may be roughly cut abroad, while the tree is green, and re-cut after they have become dry. The blocks may perhaps be cut by steam power in England, at as little expense as by hand in foreign countries, where from the lowness of wages it might be supposed England could not compete with them. Many more important points might be stated; but the valuable time of the Section must not be occupied with minutiae."

In a subsequent conversation, it was suggested that the blocks might be prepared by injecting the pores of the wood with a resinous composition. Notwithstanding the very careless manner in which the wooden pavement in Oxford Street was laid down, it was asserted that it had stood the best of all the ten experimental pavements. So little care had been bestowed, that no attention was paid to securing a dry bed, and some of the blocks were actually three inches deep in water. The contract for this portion was taken at 9*s.* 6*d.* per square yard.

2. Mr. J. Taylor announced, that the grant of money awarded by the Committee of the Association for a reduction of the duties of Cornish engines had been given to parties whose work was in the Inquiry Room. These reductions were of much interest, and would serve well as a foundation on which to found further remarks.

4. Dr. Lardner described an instrument which he had constructed for ascertaining the deviations of lines of rails. He employed a truck with wheels, without phalanges, and perfectly cylindrical, and on which a platform was placed. An iron tube crossed this, terminating at each end at right angles, into which was introduced mercury; so that it was, in fact, a mercurial level. On placing this along the

lines of railway, the mercury in the columns was found to go up and down; and into each was introduced a float and a piston, to the top of the rod of which a pencil was attached, which, on the occurrence of any incorrectness of the line, described a curve on a sheet of paper, the ordinate of which gave the variation of the rail. He had tried it on several parts of a line where the variation was perceptible. The instrument was checked so as to show that this curve was doubtlessly the real representation of the line; and being simple and easily applied, it would no doubt be found useful to contractors on new lines of rails.

EVENING MEETING.

Soon after eight o'clock, the Reverend President took the chair in the noble Town Hall, the platform, galleries, and body of which, were more than two-thirds filled by members, both resident and non-resident, and by a number of ladies.

Mr. Murchison having announced that the President of the year would address them, as is usual on this occasion, Mr. Vernon Harcourt read his address, which occupied above an hour and a half in the delivery, but of which we shall offer no summary, as we presume it will be published entire, and afford us a better opportunity of giving it, or its substance, than could be done from hearing it imperfectly.

The following is a correct abstract of Mr. Murchison's communication to the Section C. on Thursday; and in a geological point of view the most important paper of the meeting, as it unites opinions upon a great principle and much controverted theory. It is entitled, 'On the Carboniferous and Devonian Systems of Westphalia and North-western Germany.' The author states that having, in company with Professor Sedgwick, examined the older rock of north-western Germany and Belgium, it is the intention of his friend and himself to lay before the Geological Society of London a general memoir (illustrated by numerous fossils) on the classification of these ancient deposits, shewing a succession of the carboniferous, Devonian, or *old red and Silurian systems*. The present communication bears only upon one point of this analysis, and is offered as a clear and indisputable proof of the geological position of the anthracitic or culm-bearing strata of Devonshire and Cornwall. Transverse sections, in descending order from the productive coal-field of Westphalia on the N.N.E. to the uppermost division of Protogic rocks on the S.S.W., were explained; and one from Dortmund by Schelke, to the neighbourhood of Limburg and Iserlohn, was specially adduced, in which the various masses of strata are clearly exposed in five natural sections, in the following descending order:—

1. Coal shales, coal, &c. (productive coal-field).
2. Millstone grit series, with many impressions of large plants, and occasional thin seams of coal.
3. Thinly laminated carbonaceous sandstones and shales, containing many grases and small plants, together with bands of flat-bedded, black, bituminous limestone and shale, charged with *Pecilonia* and *Goniatites*, and attenuating with courses of flinty schist, the *Kiesel-schiefer* of German geologists.
4. Carboniferous or mountain limestone, of great thickness, and of the usual British mineral characters, loaded with many well-known fossils of the formation.
5. Upper Devonian rocks, consisting of black schists, gray and red sandstones, with occasional calcareous courses, and numerous fossils (the old Grauwacke of German authors).

The order and sequence of these strata is indicated and maintained along the lower edge of the whole range of the large coal-field of Westphalia, the beds successively rising to the

surface at angles, varying from 30° to 40°, in perfect conformity, and shewing throughout the clearest and most complete transition into each other. It is particularly to the group No. 3, indicated on an exhibited drawing, that the author directs the attention of British geologists; because it is, in all respects, identical with the culm-bearing strata of Devon and Cornwall, first described by Professor Sedgwick and himself, as being a portion of the true Coal-Field, and not belonging to the Grauwacke or older transition rocks, to which they had formerly been referred.*

The Westphalian sections establish the geological position of the Bideford culm strata more clearly than has been done by any stratigraphical evidence in Great Britain, by presenting five masses of unequivocal mountain limestone, rising out from beneath the black limestone and culmiferous schists; and thus the precise age of the latter is demonstrated.

In regard to the rocks of the Devonian system (old Grauwacke of German authors), which support in mountain masses the carboniferous system above alluded to, the author offered a brief and general sketch, assuring the Section of the Geological Society, that Professor Sedgwick and himself would demonstrate that these rocks fairly represent the British system generally known as the Old Red Sandstone, but to which they had recently applied the term Devonian,—a term which foreign geologists seemed well disposed to adopt, as calculated to prevent that confusion and antiquity which had arisen from the use of the word *Old Red Sandstone*, now that it is ascertained that rocks, for the most part black and slaty, occupy, over wide districts, the same geological horizon as our *Red rocks* of Herefordshire.

Proofs of the existence of the same order and succession will be hereafter pointed out in the countries of the Hartz and the Fichtelzeberge; as well as upon both banks of the Rhine, in Westphalia, and Nassau, &c.; while a splendid development of the still older Silurian rocks (both upper and lower) will be pointed out, chiefly on the left bank of the Rhine; and also in Belgium, and the region around Liege and Namur, already rendered classic ground by the descriptions of D'Omalus, De Halley, and Dumont.

New Speculum.—In the Section A., a new, and it may turn out an important instrument, was produced, on a principle of much ingenuity. Our note upon it follows:—

Mr. Nasmyth offered a few remarks 'On the Difficulties to the general Use of Metallic Specula for Reflecting Telescopes of very large size, in consequence of their excessive Weight, and of the great Nicety required in casting and grinding them.' He then drew attention to an invention of his, viz. a plate-glass pneumatic speculum, which he exhibited to the Section. The dimensions of the plate were 3 feet 3 inches in diameter, and 3-16ths of an inch thick. It had been placed on a concave cast-iron bed, the edges only of the glass resting on a rim perfectly turned, and fastened in with bees'-wax, which rendered the apparatus air-tight, and was also of a yielding character. By removal of the air from behind the mirror, which Mr. Nasmyth effected with his mouth, sucking it out by a pipe 6 or 8 inches long, the surface of the glass, previously a plane, was pressed by the weight of the external atmosphere considerably out of the level; and by this means the focus of the mirror could be varied to any length. The form which the glass takes is, as

* See former Proceedings of the British Association, in our Reports and their published volumes.

it were, a curve of its own making, not exactly a parabola, but more like an ellipsoid. Mr. Nasmyth, however, conceived that the cast-iron back being turned to an exact figure of any kind, the glass might be made by this simple mode to lie flat on the metal, and again, at pleasure, to resume the plane form. He then named some of the advantages which he thought would result from the use of this contrivance for the specula of reflecting telescopes.

Mr. Grove objected to this application of Mr. Nasmyth's discovery, as the mirror would present at least two refractive and two reflective surfaces, and therefore cause the multiplication of the image.

Professor Stevelly agreed with Mr. Grove, and suggested a similar treatment of metal.

Professor Forbes proposed the utility of the application of the principle to the testing the cohesion of substances.

The difficulty we have found in collecting and arranging our materials, has left gaps to be filled up hereafter in parts of our Report; so that it is rather a general outline of what has been going on, than a complete account of the proceedings. Another reason which induces us not to be very particular in this respect in the first instance is, that many of the communications are more or less known to our readers from previous accounts of meetings of London societies and institutions, and we have not had time so to weigh them as to select the most novel and important. In truth, some of them are very familiar friends, and others of so little interest, that we shall consider a notice of their leading features more to the purpose than the details by which they have been introduced, and the arguments for and against them.

In order, however, to give a fair taste of the qualities of those papers which are of popular value, we shall add here such as have reached us, and for which we have room, without destroying all our other divisions, and in the expectation of having further matters of the same kind in our future Numbers.

The first is of much importance to *Agriculturists*; and, as this mighty Science has been excluded from the scheme of the Association, we are the more pleased to insert the only essay on the subject.

'On the Acceleration of the Growth of Wheat.'
"To the President and Members of the British Association, &c. &c.

"The British Association has not hitherto ranked the pursuit of Agriculture as a science in the arrangements of its Meetings. It is, however, a pursuit of the first importance, and of the greatest magnitude; and although, in its early stages, the assistance which science may bestow is comparatively little needed, yet the benefit it is capable of conferring becomes more and more evident as society advances, and the wants of man increase. Of its advantage to the British nation in this particular, and at the present time, there can be no reasonable doubt. Increased power and accelerated motion have been imparted to nearly every branch of national industry; and it is therefore evident that the pursuit which does not in a corresponding manner advance, must relatively retrograde. It has been questioned how far the pursuit of agriculture can be improved by scientific research. To the mind devoted to the investigation of the great powers of Nature,—of the various elements and the diversified soils,—of the numerous tribes of plants requiring their peculiar culture, and possessing their determinate properties,—surely the field

is most extensive, and the careful investigators are few. In no pursuit is the watchful eye of discrimination more required, and the absence of performed opinions more indispensably called for, than in one where the fluctuations of seasons may modify the results of the inquirer, and disturb those principles which have a generally operating effect. The well-trained mind alone can possess the qualifications of giving the fullest power, and working up with the greatest effect, the mass of material which the experienced practitioner has the best opportunity of collecting. Where these circumstances are combined, and enterprise and sobriety of thought exist together, discovery must advance, and improvement be established. The object of the present communication is to call the attention of the meeting to a statement of facts connected with the acceleration of the growth of wheat, and a consequent diminution of the period required for its occupation of the ground, and to exhibit the results of the proceeding, and the benefits deducible therefrom. It will be needful, for the sake of comparison, to call attention to the circumstance of the ordinary period of growth allotted to the wheat plant, by which its abridged period will be properly measured. The medium may be taken from the middle of October to the middle of August, a period of ten months—twelve, or even thirteen months, being not uncommon; while, for the ordinary winter wheat, from December to August may be taken as the shortest period of ordinary growth. Observation on the progress of the plant under different circumstances, and with peculiarly selected seed, led to the conviction that much of this time might still be spared on certain soils and favourable situations; and the result has shewn that a period very little exceeding five months has sufficed to perfect an abundant crop of wheat, which was sown on the 2d of March, and which was ready for the sickle on the 15th of August following—a specimen of which is here produced. This is not a solitary case—nor is it the result of a peculiar season. In the year 1835, wheat sown the 5th of March was reaped on the 12th of August; and on a previous occasion, wheat sown the 9th of March was reaped on the 11th of August, the produce being forty bushels per acre. These circumstances being determined, and the results so satisfactory, the contributory causes demand a brief investigation. Wheat is a plant requiring a deep tenacious soil for its most congenial growth; and on such soils, previous to exhaustion, it has been grown for twenty-five successive years, with liberal harvests, and without manure. Such soils, however, form a very minute portion of the land of England; and had not skill adapted others to the production of wheat, the independence of the British nation in this particular would have been far below its present standard. To the lighter and more siliceous soils these observations on the acceleration of the growth of wheat will chiefly apply. The power of adaptation, both in plants and animals, to the varying and even opposite circumstances in which they may be placed, is very remarkable; yet are the original dispositions in either case seldom wholly extinguished. When wheat is placed upon the lighter soils, its growth and security are alike promoted by artificial pressure and compacting of such soils—this is very generally known and acknowledged—and a similar regard to the other variations which altered circumstances may present, and which it is believed have not hitherto been distinctly calculated or publicly noticed, may be found worthy of the regard of the present

scientific meeting. The lighter siliceous soils, when supported by the addition of manure, possess a warm and stimulating character, and conduce to a very rapid growth of plants, but they as assuredly become quickly exhausted; and it will, therefore, be evident, even to a mixed assembly like the present, that an acceleration of the growth and ripening of the plants committed to a light soil, and a diminution of the time required for perfecting its crops, must not only be congenial to its character, but tend to economise and prolong its productive powers. These circumstances have been observed, and seized for the improvement of the pursuit of agriculture, and with the most beneficial results in various ways. The crops have been fully equal, or even superior; the occupation of the land for this purpose has been diminished half, and set free for a beneficial occupation, directly contributing to the furtherance of this in a prolonged depasturage of a preceding crop by sheep, tending still further to compact the ground and obviate its natural disqualifications for the production of wheat; the risk from injury by insect devourers, and by weather, is alike abridged; and, above all, the fertile powers of the soil are at once directed to the formation and support of the ear of wheat, the truly valuable portion, instead of being uselessly expended in an excessive growth of blade or leaf, which the soil has not ultimately the power to supply with grain in just proportion. A matured siliceous soil will carry to maturity, with an accelerated step, the plant of wheat; a short stage at a rapid rate it is, by natural constitution, well calculated to perform; but it has not the strength for prolonged continuance, possessed by more powerful, yet more tardy soils. Science will at once prescribe the application. The means of accelerating vegetable growth, and the evils attending it, remain to be pointed out. Aspect, soil, situation, climate, and manure, all tend to affect the rapidity of the progress of plants towards maturity, and the discriminating mind will select the favourable station from whence to derive a supply of seed. It is an unquestionable law of vegetation, that the plant of early maturity again seeks to become so, even when placed in unpropitious circumstances—that it recedes with reluctance from the station of its parent; and the circumstance is valuable for accelerating the growth of wheat in any soil. Where it is desirable to do so has been already detailed, these are some of the means:—The crop once ripened in a period of about five months, has an acquired disposition to reach maturity again in a similar time, and although, if placed under very unfavourable circumstances, it will fail to accomplish this, it will not fail so much as seed would do which had not been grown so quickly. The nature of the plant becomes accelerated, as other plants become acclimated, and seed may thus impart changes most beneficial to the various kinds of soil. But there are still means, of a more mechanical character, for accelerating the maturity of a crop of wheat, which are frequently too much neglected, in securing by adequate seeding thickness of crop; which, it is still very generally known, conduces to regular and early ripening. The reasons of this may form an interesting subject of inquiry in another department of the Association; and although the cause of so beneficial a result may probably be found in the more effectual stopping of the rays of the sun, and a more general radiation of heat, which there takes place; yet the fact that such is the case, gives an additional means of accelerating the growth of wheat in the spot from whence seed is se-

lected, as well as in that where it is to be again deposited. This is deserving of the most marked attention, as the evils to which rapidly grown wheat is most obnoxious are best prevented by abundant sowing and compacting of the soil; both of which have been directly recommended on their own account: the rust or mildew, arising from atmospheric influence, over which man has no control, except in averting the predisposing causes, might very probably injure, most extensively, rapidly grown wheat, standing thinly on the ground; but such should not be the case, and, practically, the crops alluded to have not suffered from this cause, or any similar evil. In conclusion, I hail with delight the existence of an Association so extensive, so enlightened, and so harmonious, met together to accelerate the progress of important truths, and to disseminate their beneficial influence over an improved and rapidly improving world.

“GEORGE WEBB HALL.”

August 20, 1839.

A conversation ensued, and Mr. Webb Hall very satisfactorily answered several questions put to him. It was stated, among other things, that one hundred and fifty different kinds of wheat might be found in one field in England, and that above two hundred kinds were cultivated in Spain.

Our next paper is on a medical subject; but, with the introductory note, explains itself:—

SECTION E.

[This pertains to the class of papers for which we made an exception in our Monday's notice.]

‘On Alkaline Indigestion,’ by Robert Dundas Thomson. The author stated that he had discovered this form of dyspepsia in 1835, and had communicated the results of his observations to the Medical Section of the British Association, at Bristol. Since that period he had continued his researches, and had confirmed the accuracy of his first results by the examination of a very great number of cases. It has been long known that, in stomach complaints, fluids are often ejected from that viscus into the mouth, and it has been by examining the chemical constitution of these fluids, that the author has been enabled to simplify, in some considerable degree, some of the most disagreeable forms of dyspepsia. Dr. Thomson divides the fluids, which he has detected in these complaints, into *acid*, *alkaline*, and *neutral*. 1. The acid state is familiar to most persons. In the natural state there is no doubt that, during a certain period of the process of digestion, the contents of the stomach exhibit an acid reaction; that is to say, that litmus paper dipped into the fluid existing in the stomach becomes red, that the fluid tastes acid, and that when distilled over, a quantity of pure water having been previously added, the fluid, which passes into the receiver, exhibits a faint acid reaction. This does not occur, however, according to Schulz, during the first half-hour or hour of the process of digestion; the acid would therefore appear to be generated during the process. [The discussion as to the nature of the acid, Dr. Thomson said he would reserve for the Chemical Section.] When this natural acid, as it may be termed, accumulates to a certain extent, and symptoms of disease exhibit themselves in the form of a burning sensation about the pit of the stomach, with acid eructations, which do not, however, alleviate the pain; this is the characteristic symptom of *acid indigestion*. 2. The second form of indigestion indicated by the fluid ejected from the stomach, Dr. Thomson terms *alkaline indigestion*. This is characterised by a violent pain in the region

of the stomach, accompanied frequently with headach and faintness, with a sensation of spasm or contraction in that viscus; this sensation goes on increasing till it frequently becomes intolerable, and at last, when the agony is complete, the patient is suddenly roused by a determination to the mouth of a large quantity of fluid, which must be immediately evacuated, to give place to a succession of similar occurrences: at last, however, the flow of fluid becomes so abundant as to constitute an actual stream; it continues to flow for some time, but gradually diminishes in quantity, and at length ceases, and with it the pain in the stomach. The latter is the characterising symptom of *alkaline dyspepsia*, or *pyrosis*, as it has been frequently termed. But hitherto it has been always confounded with other forms of indigestion. Dr. Prout has published an account of his examination of the fluid of pyrosis, and has stated that it was acid. The fluid, however, was not procured by himself, but was sent him from one of the hospitals, where the mistake was very likely to occur. This form of indigestion occurs much more frequently than is generally supposed. Dr. Thomson stated, that out of forty or fifty patients daily seen at Blenheim Street Dispensary, in London, he generally met with one or two affected with symptoms of this description. It frequently occurred in coincidence with affections of other organs, as of the liver, &c., and was often of such a pressing nature, that it required more of the skill of the medical man than the original disease. Certain it was, that it was absolutely necessary to treat it with as much care as the original complaint, and if the action had been allowed to go on for some time unchecked, the second affection became as firmly fixed as the original disease which had induced it; so that after the removal of the latter, a second disease, as firmly rooted as the first, required to be taken under the physician's care. The treatment consisted of the administration of acids, tonics, and narcotics, which required to be prescribed with care, otherwise the acid indigestion was frequently induced, which was as difficult to eradicate as the alkaline form. 3. The last form of indigestion, as indicated by the fluid ejected by the mouth, which the author had met with, was a neutral state, which was of much rarer occurrence. Dr. Thomson had, however, met with several cases, and had succeeded in overcoming the disease by the use of tonics.

Our third communication is one of great electrical interest. It was read at Section B, where previously nothing had struck us as worthy of particular notice, except a new safety lamp, the foreign inventor of which found too much difficulty in explaining it, owing to his want of acquaintance with our language. It seemed, however, to be a very ingenious contrivance:—

‘On a Small Voltaic Battery of extraordinary Energy, by W. R. Grove, Esq. M.A.’

“In a letter, published in the ‘Philosophical Magazine,’ for February, I stated some reasons for hoping that by changes in the constituents of the combination of four elements, we might greatly increase their energy. At that period I sought in vain for improvements, which a fair indication convinced me were attainable; but being in the country, all my experiments were with copper, as a negative metal. I was consequently unable to use concentrated nitric acid as an electrolyte, and its importance never occurred to me until forced upon my notice by an experiment which I made at Paris for a different object. This object was an endeavour to prove that the disso-

lution of gold in nitro-muriatic acid was an electrical phenomenon, or rather that this (and as I believe, with Sir H. Davy, every other chemical phenomenon) could be resolved into an electrical one by operating upon masses instead of molecules. The experiment was the following: The extremities of two strips of gold leaf were immersed, the one in nitric, the other in muriatic acid, contact between the liquids being permitted, but mixture prevented by an interposed porous diaphragm; in this case the gold remained undissolved for an indefinite period, but the circuit being completed by metallic contact, either mediate or immediate, the strip of gold in the muriatic acid was instantly dissolved. Thus it seems, that the affinity of gold for chlorine is not able alone to decompose muriatic acid, but when aided by that of oxygen for hydrogen, the decomposition is effected: this phenomenon bears much analogy to ordinary cases of double decomposition. The two gold strips in this experiment being connected with a galvanometer, occasioned a considerable deflection; and it now occurred to me, comparing this experiment with my previous observations, that these same liquids, with the substitution of zinc and platinum for the gold leaf, would produce a combination of surpassing energy. My expectations were realised; and on the 15th April last, M. Mecquerel presented to the French Academy a small battery of my construction, consisting of seven liqueur-glasses, containing the bowls of common tobacco-pipes; the metals, zinc and platinum; and the electrolytes, concentrated nitric and dilute muriatic acids. This little apparatus produced effects of decomposition, equal to the most powerful batteries of the old construction (see ‘Comptes Rendus,’ April 15th, and ‘Philosophical Magazine’ for May). I have since this tried various combinations upon the same principle, and though some of the rarer substances—such, for instance, as chloric acid—have produced powerful combinations, I have found none superior, and few equal, to the above. I therefore directed my attention to utilising these materials, and rendering the apparatus more economical, although I soon found that it was not so expensive as it at first appeared; the platinum being unaltered, and the concentrated acid producing a more durable effect than the electrolytes usually employed. Dilution of the nitric acid with water diminished the energy, but in the course of some experiments on the conducting power of different liquids, I found that nitro-sulphuric acid (a mixture of equal parts, by measure, of the two acids) acted as an electrolyte much as nitric acid; that it was an excellent conductor; and yielded oxygen at the anode, and no hydrogen at the cathode. Applying this to my battery, I found it succeed admirably, and hence a considerable diminution of expense. On the side of the zinc, I found that salt and water was but little inferior to dilute muriatic acid. It also does away with the necessity of amalgamating the zinc; but it sometimes, though very rarely, disaggregates the porous mass from the crystallisation of the nitrate of soda: excepting, therefore, in very large batteries, where expense is a material consideration, I should prefer employing muriatic acid diluted with four or five times its volume of water. By using flattened parallelopiped shaped vessels, instead of cylindrical, the concentrated acid is much economised, the space diminished, and the metals approximated.* The hastily con-

structed battery which accompanies this note, consists of an outer case of wood (it should be of glazed earthenware), $7\frac{1}{4}$ inches by 5 and 3, separated into four compartments by glass divisions; into those compartments are placed four flat porous vessels, the interior dimensions of which are $7, 2\frac{1}{2}$, and $\frac{3}{4}$ of an inch; they contain each three ounces, by measure; the metals, four pair, expose each a surface of 16 square inches; and the battery gives, by decomposition of acidulated water, 3 cubic inches of mixed gases per minute; charcoal points burn brilliantly; and it heats six inches of platinum wire $\frac{1}{8}$ of an inch diameter; and its effect upon the magnet, when arranged as a single pair, is proportionately energetic; it is constant for about an hour, without any fresh supply of acids. The porous vessels are identical in their constitution with the common tobacco-pipe. As far as my experiments go, its power, with reference to the common constant battery, is, *ceteris paribus*, as 6 to 1, but the proportions vary with the series. The cost of the whole apparatus is about 2l. 2s. During the operation of this battery, the nitric acid, by losing successive portions of oxygen, assumes, first, a yellow, then a green, then a blue colour, and, lastly, becomes perfectly aqueous; hydrogen is now evolved from the platina, the energy lowers, and the action becomes inconstant. It is worthy of remark, as an argument for the secondary nature of metallic precipitation by voltaic electricity, that the oxidated or dissolved zinc remains entirely (or at least by far the greater portion) on the zinc side of the diaphragm, the hydrogen alone appears to be transferred; and yet the reversal of affinities, which the theory of reduction by the nascent hydrogen supposes, is an enigma difficult of solution. I have invariably observed, in this battery, a current of endosmosis from the zinc to the platina, or with the current of positive electricity. The rationale of the action of this combination, according to the chemical theory of galvanism, appears to be as follows: In the common zinc and copper combination, the resulting power is as the affinity of the anion of the electrolyte for zinc, minus its affinity for copper; in the common constant battery it is as the affinity of the anion for zinc, plus that of oxygen for hydrogen, minus that of oxygen for copper. In the combination in question, the resulting power is as the affinity of the anion for zinc, plus that of oxygen for hydrogen, minus that of oxygen for azote.* Nitric acid being much more readily decomposed than the sulphate of copper, resistance is lessened and the power increased; and no hydrogen being evolved from the negative metal, there is no precipitation upon it, and, consequently, no counter-action. I need scarcely add a word as to the importance of improvements of this description in the voltaic battery. This valuable instrument of chemical research is thus made portable; and, by increased power in diminished space, its adaptation to mechanical, and especially to locomotive purposes, becomes more feasible.”

POSTSCRIPT.

At the General Meeting, at three o'clock, the President in the chair, the Report of the last meeting was read and signed.

The place appointed for the next meeting was Glasgow, and the time fixed, Thursday, September 17th; the General Meeting to assemble on the preceding day. This change was to accommodate the religious feeling of Scotland

* According to Professor Ritchie, the power is inversely as the square root of the distance between the metals.

* I have thrown out of the case the resistance to decomposition of the electrolyte in contact with the zinc, as common to the three combinations.

against Sunday travelling, which would have been violated if the meeting had taken place on the Monday, as heretofore.

Other applications were made from Hull, Manchester, Plymouth, and York.

The Marquess of Breadalbane was elected president; Dr. Macfarlane, principal of the University, Lord Greenock, Sir T. Brisbane, and Sir D. Brewster, vice-presidents; Dr. J. P. Nichol, Andrew Liddell, and John Strang (or Strachan), Esqrs., local secretaries; and Charles Forbes, Esq., local treasurer.

On the retirement of the Dean of Ely from the office of one of the general secretaries, Major Sabine was elected as his successor; and, on the earnest entreaty of the council and the members at large, Mr. Murchison, who had also signified his intention to retire, was induced to remain at least another year, it being represented to him how detrimental it would be to the interests of the Association, if both general secretaries withdrew their services at the same time.

Professor Phillips (called away by the dangerous illness of his uncle, Mr. Smith, the father of our geological science) was re-elected assistant general secretary; Mr. Taylor, treasurer; Colonel Sykes, Mr. Porter, and Mr. L. Horner, auditors; a numerous council, nearly as before, and Mr. James Yates, as their secretary.

REVIEW OF NEW BOOKS.

IRELAND.

[Second notice.]

ACCORDING to our promise last week, we turn to the various works on Ireland which we have accumulated upon our table. Mr. Fraser's *Guide through Ireland* appears carefully executed; but we think that it might have been made what is called "a more readable" book. For instance, Kilmallock is dismissed in the following summary manner:—

"Built by the Earl of Desmond, and demolished during the wars of the Commonwealth; its ancient walls, gates, and houses, as well as its ecclesiastical and civic ruins which are scattered around, will recall its former grandeur and prosperity. As there is but little business carried on in this small place, it has a solitary aspect, but possesses great interest for the antiquarian and lover of the picturesque. The principal ruins are the abbey, now used as a parish church, and the interesting remains of the Dominican friary. In the latter is the tomb of Fitzgerald, the White Knight. The Anogue stream runs close to the town."

As brevity is said to be the soul of wit, we are ready to acknowledge this to be the wittiest point of Kilmallock extant; but after reading the romantic historical details which Lady Chatterton has collected respecting this interesting town, we cannot help thinking that Mr. Fraser might have said something more to attract the attention of the traveller to a place distinguished as "the Balbec of Ireland."

Without travelling in the country described, at hand (see *Literary Gazette*, No. 920, September 6th, 1834), it is impossible to test the accuracy of guide-book statements; but, in turning over the pages of Mr. Fraser's work,

following, as a kind of test, the tour of Lady Chatterton, we are struck by some discrepancies. At p. 174, Mr. Fraser says, speaking of that wild and lovely district, Glengarriff, "the road which traverses the glen is suited to pedestrians." Now, it would appear from Lady Chatterton's "Rambles," vol. i.

3, that there is no difficulty in driving through Glengarriff. This is an important fact for travellers to be correctly informed

upon, as it may make a serious difference in their arrangements.

We also observe that Dingle, p. 216 of Fraser's *Guide*, is noticed without a single word about the numerous antiquities in its neighbourhood. Of course, it would have been impossible to introduce minute descriptions of them; but they might have been mentioned as objects deserving attention: that they are so we cannot doubt, when we find Lady Chatterton devoting six days and one hundred pages to their examination.—See "Rambles," vol. i. from page 127 to 227.

On the whole, however, we believe that Mr. Fraser's *Guide* will prove a useful hand-book for tourists; although we cannot help feeling that, even within the same limits, much more might have been done to enrich the matter, which appears to us too cold and statistic for an agreeable travelling companion.

Of an equally cheap, and, what is singular, excellent *Map of Ireland* published under the superintendence of the Society for the Diffusion of Useful Knowledge, we cannot speak in terms of too high praise. The precision, the distinctness, the pains bestowed upon spelling those "heathenish Irish names," as Charles II. termed them, must have been the work of vast time, labour, and patience. Whenever we have referred to this map, and we have frequently done so for nearly the last twelve months, the result of our reference has been the conviction that it could have been compiled by no other hand than that of the Hydrographer of the Admiralty, to whose silent labours in the improvement of naval charts the whole civilised world bears witness. Among the peculiar features of this map, besides an important statistic table, a list is introduced of the round towers of Ireland, with their present state shewn by the following abbreviations:—*p.* perfect, with conical cap; *np.* nearly perfect; *i.* imperfect; *s.* only the stump; *f.* foundations only; *v.* remarkable variety in the construction. Dr. Ledwich, who gave what was considered a very complete list of the round towers which had been discovered in Ireland, enumerates sixty-five; but the list given in the Society's map extends to no less than one hundred and eighteen: a convincing proof, if indeed proofs were wanting, how little Ireland is known even by her actual residents. The following sixteen round towers, according to the map before us, remain in a perfect state:—

1. Antrim	85 feet	Antrim County.
2. Ardmore	90 do.	Waterford.
3. Cashel		Tipperary.
4. Clonsilla		King's County.
5. Clonsilla		Monaghan.
6. Devenish	82 feet	Fermanagh.
7. Fertagh	96 do.	Kilkenny.
8. Glendalough		Wicklow.
(St. Kevin's Kitchen.)		
9. Kildare		Kildare.
10. Kilkenny		Kilkenny.
11. Kilmacduagh		Galway.
12. Roocra		Tipperary.
13. Sier Kieran	30 feet	King's County.
14. Swords	73 do.	Dublin.
15. Timahoe		Queen's County.
16. Turlough		Mayo.

To Miss Beaufort, we presume, we are indebted for this catalogue of Irish round towers; and it forms a most valuable appendix to that accomplished lady's "Essay upon the State of Architecture and Antiquities, previous to the landing of the Anglo-Normans in Ireland," published in the fifteenth volume of the "Transactions of the Royal Irish Academy."

Mr. Graham's *History of Ireland, from the Relief of Londonderry in 1689, to the Surrender of Limerick in 1691* (No. 4 on our list), notwithstanding that the author is distinguished as an unflinching advocate of the Protestant

cause, and a powerful party-writer, is compiled with that careful historical industry, chiefly from contemporary and respectable authorities, which are fairly quoted, that we must admit, as lawyers would phrase it, "a good case has been made out."

It is unnecessary for us to enter into a review of this period, but the following account given by Mr. Graham, in the appendix, of the discovery and reinterment of the remains of Walker, the gallant defender of Londonderry, will gratify the curiosity of some of the admirers of that distinguished man:—

"On Tuesday, the 16th of October, 1838, the church of Donoughmore at Castle Caulfield, being in process of repair by the Ecclesiastical Commissioners, it was found necessary to lower and level the floor of it. In that part of the chancel immediately under the monument of Governor Walker, the workmen discovered a full-sized oak coffin, containing the remains of his widow, who, in 1703, caused his bones to be brought there from the banks of the Boyne, where his body had been interred, and had lain for thirteen years. They were this day found in a small oak box, in which this 'widow indeed,' full of the endearing recollections of happier days, had deposited them. This worthy body was the mother of four sons of the renowned Walker, who at his death were serving in King William's army; and each of whom, in justice to their immortal father's services, and their own, ought to have inherited one of the forfeited estates. John Walker, the eldest son, on a petition to the House of Commons, obtained a pension of two hundred pounds a-year, which he enjoyed until the beginning of the reign of George the First, when he was deprived of it by the parsimony of the triumphant Whigs. Of the other sons there is no record, save that the daughter of one of them was the grandmother of the late Mrs. Calbeck, of Lisburn. The Walkers were a Yorkshire family. The father of the governor of Derry was the Rev. George Walker, sen., rector of Cappagh, county Tyrone, the friend and confidential adviser of Dr. Bramhall, bishop of Derry, when this prelate was nobly using his private means and public influence in regaining the alienated property of the Church of Ireland, and purchasing the advowsons of the appropriated rectories, which he added to the vicarages throughout the diocese. He sent his son and namesake to Glasgow College for education, and on the young man's return, soon after the restoration of King Charles the Second, he was presented to the rectories of Donoughmore and Errigall Keerogue in the county of Tyrone. Walker was in the sere and yellow leaf of life when he went to Derry in 1689, being then, according to credible tradition, 71 years of age. His sister Anne married William Maxwell, Esq., of Falkland, high sheriff of the county of Monaghan in the year 1691, and who was great-grandfather of the present representative of his renowned ancestor—the Rev. Thomas Carpendale, rector of Donoughmore. Mr. Carpendale, with Edward Evans, Esq., son of the Rev. George Evans, who had been upwards of thirty years rector of Donoughmore, Alexander Mackenzie, Esq., and a few others, naturally regardless of the remains of this great and good man, caused them to be taken carefully from the decayed box in which they were found, and putting them, and those of his widow, into smaller boxes, enclosed both, with suitable inscriptions, in a leaden coffin, which being laid in one of deal plank, was solemnly deposited in the hero's grave by his reverend

descendant and successor, assisted by the Rev. John Graham, author of the 'History of the Siege of Derry,' and also by one of the oldest apprentice boys of the maiden city. In the case with Governor Walker's remains was placed a flint glass-bottle, hermetically sealed, containing the following writing on parchment. 'Be it recorded, that whilst this church was undergoing repair, in the year 1838, search was made beneath the monument of the Rev. George Walker, immediately opposite to the communion-table, at the eastern end of the church, and south side of the aisle, to ascertain whether his bones were deposited there, agreeable to the inscription on the monument erected by his widow, in the year 1703. We whose names are hereunto subscribed, having assembled in said church on Tuesday the 16th October, 1838, and having made search immediately beneath said monument fixed in the wall, have found, in a full-sized oak coffin, the remains of the widow, and in a small oaken case adjoining were deposited bones which had not the appearance of regular interment in a coffin, but corresponding with the words of the monument, 'Ossa reconduuntur,' &c. &c. Now, to testify our veneration and respect for the memory of the illustrious Walker, we herein carefully replace the bones, and restore them in their former position, together with this record.' [Here follow five signatures]. Previous to the reinterment of the bones a cast was taken of the skull, which was perfectly sound, and in which the organs of intelligence and firmness were remarkably developed. Walker afforded an instance of the value of a classical education and habits of literary composition to a military man; proving that the hero capable of recording actions in which he has been concerned, with modesty and without exaggeration, is more likely to get full credit for his own merits, than the illiterate warrior, who requires another man's pen to do justice to him."

About the part which Walker acted, there has been much discussion. In our opinion, the circumstances of the times forced him into the position which he held during the memorable siege of Derry. He afterwards, as is well known, proceeded to London, where he was received in the most enthusiastic manner. While in London, Walker published his "Diary of the Siege of Londonderry;" in the address prefixed to which he apologises, as a churchman, for having acted in that service a part which might with more propriety have been done by other hands. It has been asserted that the reward of Walker's conduct was the bishopric of Derry, and therefore it is stated by the late Mr. O'Driscoll, in his "History of Ireland,"—a work, the impartiality of which has been, and certainly with some reason, extolled,—that *this man* (thus contemptuously is the noble and enthusiastic George Walker referred to) was unnecessarily present at the Boyne. "Walker's exploits at Derry," adds O'Driscoll, "might have had an excuse in the peculiarity of his situation; but neither his exhibitions in London, nor his presence at the Boyne, can be justified."

We give this passage as a specimen of the way in which Irish history is written even by the most impartial. Now, the fact is, that Walker was a hero in Derry, the advocate of his brave fellow-sufferers in London, and in the course of his duty as a Protestant clergyman appointed chaplain-general of the army, was present at the battle of the Boyne, where he was killed. What might have been the grateful intentions of King William towards Walker, as to promoting him to be bishop of

Derry, it is impossible that the appointment could have taken place, for that see was not vacant until the day previous to the battle of the Boyne, and William, therefore, could not have known of the vacancy before Walker's death.

After Mr. Graham's, the next Irish book on our list is Mr. Smyth's "*Chronicle of the Law-Officers of Ireland*," containing lists of the lord-chancellors and keepers of the great seal, masters of the rolls, chief justices and judges of the courts of King's Bench, Common Pleas, and Exchequer, attorneys and solicitors-general, with the sergeants at law, from the earliest period; dates and abstracts of their patents; fees and allowances from the crown, tenures of offices, references to the records, and patents of precedence; also a chronological table of the law officers, with the promotions, deaths, or resignations, from the reign of Queen Elizabeth to the present time; judges' salaries in 1690, and as fixed by the 2d and 3d William IV.; with an outline of the legal history of Ireland, and copious indexes."

After fairly transcribing this, the title-page of Mr. Smyth's volume, which, if executed with accuracy, must be a valuable work of reference, we feel that very little is left for us to say in the way of criticism. However, at page 18, we may be allowed to inquire whether the lord-chancellor mentioned twice as Robert Fitz-Eustace, Lord Portlester 1472 and 1486, is not the identical Sir Rowland Fitz-Eustace, who is mentioned in the same page and intermediate year of 1474, but not as Lord Portlester? If we supposed that our readers generally took much interest in an examination of this nature, we have no doubt that a little more time than it is at present in our power to bestow upon the investigation of this promising title-page, might lead us to cross-examine Mr. Smyth in a manner which would not be perfectly agreeable to him. If any one, however, will undertake to fill up the outline of the legal history of Ireland—to give life to the skeleton of Mr. Smyth, we pledge ourselves that it would be a most acceptable work to the public. And here, for the present, we must close the notice of our Irish heap of books, to resume next week with Mr. Otway's "Tour in Connaught," from which we can venture to promise our readers some sketches of Ireland and the Irish by a master hand.

A Paper:—of Tobacco.

[Second and concluding notice.]

"No people in the world smoke worse tobacco, or pay so dear for it, as the people of this country. The very worst kinds of leaf, which nowhere else could find a market, meet with a ready sale among the English manufacturers; and, after being duly liquored—with a solution of copperas as is commonly reported—are worked up into shag. Some of this veritable mundungus is so strong, that a couple of pipes are sufficient to set the head of an Irish coal-beaver a-swimming. In consequence of the high price of tobacco, most of the lower classes prefer that which produces the most powerful effect on the nervous system in the shortest time; and it is from this cause that strong tobacco-leaf commands in the English market a comparatively better price than such as is mild and fine flavoured. Jonathan Carver highly commends the tobacco grown in the Northern States of America, on account of its being stronger than that grown in the South: 'As much time,' says he, 'would be required to smoke one pipe of it, as three of that which is generally used: before so great a quantity of

the vapour could be drawn from it as to prove hurtful, the smoker, from intoxication, would be unable to continue his amusement.' This commendation of strong tobacco is something like a north-country fishwoman's praise of a sample of very strong Leeward Island rum: 'A single glass of it is like to burn your very heart out, and two will make you comfortably drunk.' The high duty, nine shillings per pound, imposed on foreign cigars and foreign manufactured tobacco, not only gives encouragement to smuggling, but renders it almost impossible for consumers to obtain good home-manufactured tobacco and cigars, except at the price charged for foreign. The immense number of small cigar-shops in London sufficiently demonstrates the great profits that are derived from retailing English manufactured Havannahs at the price of genuine Woodvilles or Silvas. Though our manufacturers purchase the leaf as cheap as the Dutch, yet much better home-manufactured Havannah cigars can be purchased in Holland for ten shillings per pound than in England for twenty-four shillings; and the same kind of kanaster tobacco,* which is here charged eight shillings per pound, can be there bought for three shillings. Even after allowing three shillings per pound for difference in the duty, the price charged by the English retailer beyond that of the Dutch is eleven shillings per pound on the cigars, and two shillings per pound on the kanaster tobacco. Under such circumstances it really cannot be a matter of surprise that a poor gentleman should prefer dealing with a bold smuggler rather than with a petty licensed extortioner. Were the duty on foreign cigars and foreign manufactured tobacco reduced to three shillings, and that on home-manufactured to one shilling per pound, there can scarcely be a doubt that the net receipt at the Exchequer, on account of those articles, would be considerably increased. The smuggler's trade would be almost totally destroyed, for the chance of profit would scarcely balance the risk of loss; those who now smoke one cigar would smoke two: and the consumption of the finer kinds of tobacco would at least be trebled. The saving tradesman, who now orders 'a screw' of shag and a small-headed pipe, with his sixpenny-worth of gin-and-water, would treat himself to half-an-ounce of kanaster, and smoke a pipe of more capacious bowl. At the Havannah the price of the best cigars is about 6s. a-pound, which, allowing the general average of one hundred and twenty to the pound, is at the rate of little more than a half-penny each. In Spain, where the manufacture is monopolised by the crown, cigars of the best Havannah leaf are sold at the royal factories in Seville and Malaga—the only places where they are made—at the rate of 7s. 6d. per pound, which is just three farthings each.

"The principal kinds of tobacco smoked in this country are:—Turkey, Varinas, and kanaster, consumed by the more wealthy classes who can afford to purchase fine tobacco, and indulge in a real meerschaum; Orinoco and Maryland, chiefly in favour with incipient amateurs; returns, the delight of steady, seasoned smokers; and shag, the favourite of all who like a 'strong article.' Pigtail, or small twist tobacco, shired small, is not unfrequently smoked

* At the most respectable shops at the 'west end,' genuine Havannahs cannot be purchased for less than 30s. per pound; and, for exceedingly fine samples, two guineas are not unfrequently charged.

† A penny paper of tobacco is, in London, termed a screw. 'I say, mister,' inquired a sailor one day of a pot-boy, at a public house in Wapping, who had brought what he considered a very small pennyworth, 'do you call this here a proper full-sized screw?' 'Yes.' 'Why, then, I can only tell you it's a precious soft-road one.'

by many persons, but more particularly in Scotland; and a few iron-nerved smokers occasionally take a pipe of negro-head. The best Turkey tobacco is of most delightful flavour, and is so mild that three or four large pipes affect the head less than a couple of pipes of the mildest English returns. The chief objection to the use of this kind of tobacco is its excessively high price,—from twelve shillings to fourteen shillings per pound. Turkey tobacco is frequently called Latakia, from the name of the port in Syria from which it is chiefly shipped to England and other countries in Europe. *

"Varinas, so called from a town and province of the same name in Colombia, celebrated for excellent tobacco. Varinas is usually imported in rolls, formed of the leaves of the tobacco spun into a kind of thick twist. By many smokers of unquestionable taste it is preferred to Turkey, from its being rather stronger, and having, as they say, more of a real tobacco flavour. Most of the tobacco imported into this country from Colombia and Guatemala,* is sold as Varinas; and the present price is about ten shillings per pound. Kanaster, or canaster, derives its name from the large wicker or cane baskets, called *canastros* by the Spaniards, in which the finest kinds of tobacco used formerly to be imported into Europe from Spanish America. The spelling, kanaster, or sometimes knaster, we owe to the Germans and Dutch, by whom this kind of tobacco is highly prized. The very best kanaster is of the growth of that part of Spanish America which lies between the equator and the tenth degree of north latitude. It is mostly imported in rolls, similar to Varinas, which is only a superior kind of kanaster. A considerable proportion of the tobacco sold under this name, both in England and on the Continent, is not genuine, but is mixed with an inferior kind of leaf. Genuine kanaster is comparatively mild and of fine flavour, while that which is adulterated is frequently rather strong, and sometimes has a peculiar druglike and rather musty smell. A mixture of one-third choice Varinas to two-thirds of mild returns—(Taddy and Co.'s, 45 Minorities, to my taste is the best)—will generally be found superior to most of the kanaster that is to be had of small retail dealers. The present price of kanaster is eight shillings per pound. Orinoco is not, as its name would seem to imply, manufactured from tobacco grown on the banks of the river Orinoco, but from a kind of sweet-scented, mild Virginia. It differs but little from Maryland, except in being lighter coloured, rather milder, and of a sweeter flavour. Both kinds are chiefly consumed by persons who find returns too strong. They are pleasant enough to smoke when nothing better can be had; but they both have the effect of rendering the mouth parched and dry, and of exciting a prickly sensation in the tongue. The present price of Orinoco is sixpence, of Maryland fivepence, per ounce. The tobacco called returns is manufactured from the best and mildest kind of common Virginia leaf, with the stalk taken out. The name returns, as applied to tobacco for smoking, is of comparatively recent date. About forty years ago, short-cut was the favourite with those for whom the common shag

was too strong; and as this kind of tobacco, in order to make it sufficiently small, was rubbed through a sieve, the comparatively long shreds or outstings, which would not pass through the wires, were called returns. The smoking public having become tired of short-cut, on account of its small particles frequently getting into the stalk of the pipe and stopping the draught, the manufacturers tried them with a sample of returns, under the name of long-tails. The quality was approved of, for it was precisely the same as that of short-cut; but as the appellation was not fancied,—it was even worse than shag—the manufacturers changed it to the old trade name of returns. Modern returns is, therefore, almost the very same as old short-cut unsifted.

"Shag tobacco has obtained its distinctive name from its being so finely cut that the filaments appear like so much shag, the old name for short and matted wool or hair." It is manufactured of the strongest and very worst kind of leaf, and is chiefly consumed by the poorer classes. Persons of a nervous temperament, who take little exercise, ought particularly to avoid smoking this kind of tobacco, as its frequent use is extremely apt to induce paralytic affections. There can be little doubt that many of the cases of palsy among the poorer classes engaged in sedentary employments, are in a great measure owing to their immoderate indulgence in stupefying shag tobacco. Pigtail, when smoked, is equally as strong as shag. The present price of shag is fourpence, and of pigtail fourpence-halfpenny, per ounce. Negro-head is formed of the leaves of tobacco steeped in molasses, and tightly twisted together. It is generally very strong, but is seldom smoked alone. The flavour of good negro-head is extremely sweet. A smoking friend of mine, who is fond of trying new mixtures, says that Orinoco and Maryland, and even mild kanaster, is materially improved by a small portion of negro-head cut small and placed as a priming above the charge. The present price of negro-head is fivepence per ounce. The quantity consumed is very trifling. Sailors in the West India trade sometimes bring a little home to present to their smoking friends."

But then comes the discrimination:—

"A very considerable portion of the cigars sold in this country as 'real Havannahs,' are formed of a very inferior kind of leaf, with only the outside of better quality. A person who has a nose and a palate will judge of a cigar from its flavour, and not decide upon its goodness from the circumstance of its burning to a white ash. I most earnestly recommend all smokers who cannot afford to buy a box of a respectable dealer, to abstain from buying threepenny mock Havannahs at little paltry tobacco-shops, for they pay at least a third more for the article than they justly ought.† The man who should establish a retail shop for the sale of cheap and good cigars, somewhere between Drury Lane and Coventry Street, would deserve well of all 'gentlemen about town,' who purchase their Havannahs by sixpenny-worths, and doubtless would in a short time realise a handsome fortune. A joint stock company for supplying the public with tobacco and cigars at a moderate price,—with his Royal Highness the Duke of Sussex at the

head of the directors, and the Duke of Devonshire trustee—would be a much better speculation than the Genuine Milk and Cream Company."

This would, indeed, be the cream of the joke; and a fortune out of smoke would be quite *à propos* after the famous snuffman's motto on his carriage:—

"Who would have thought it,
That noses could have bought it?"

We pass over all the observations on chibooks, meerschaums, pipes, tobacco-stoppers, &c. The following old custom, if revived, seems to offer a vent for much of the poetry which it falls to our lot to review—volumes of poetry conjoined with volumes of equally perishable smoke.

"From a passage in an old English book, printed about 1597, we learn that tobaccoconists were accustomed to purchase unreadable poems and pamphlets for the purpose of wrapping their tobacco in; and from the following verses in 'Drunken Barnaby's Journal,' probably printed in 1647,* it appears that tobaccoconists were then accustomed to decorate their papers with a motto:—

"A shop neighbouring nears Iaccho,
Where Young vends his old tobacco;
'As you like it,' sometimes sealed;
Which impression since repealed;
'As you make it,' he will have it,
And in chart and front engrave it."

Modern tobaccoconists have frequently a conundrum printed on their ounce and half-ounce wrappers."

And herewith we conclude. Should the votaries of this filthy custom think proper to make wrappers of this sheet of paper they are welcome; and Mr. Scripps, our publisher, will be ready to supply it stamped or unstamped, for the same office. Or he will be ready to make a contract with the Duke of Sussex, the Duke of Devonshire, and other Directors and Trustees of the Genuine Cigar Joint Smoke Company, when it shall be established! His address is, No. 7 Wellington Street, Strand; and, N.B., no connexion with any other shop.

MISCELLANEOUS.

Histoire du Mont Saint-Michel, et de l'Ancien Diocèse d'Avranches. Par l'Abbé Desroches. 2 tomes 8vo. et atlas fol. Caen, 1838. Mancel; London, Dulau and Co.

THIS is a very comprehensive, and we may add valuable, acquisition to historical literature. The work embraces every event, from the most remote period to the present time, even to the middle-age superstitions and miracles, in which the Abbé Desroches is a more than credulous believer. This is, perhaps, the greatest fault of the volumes under consideration; for the author attaches importance to, and draws conclusions from, what he supposes to be facts, but which are really nothing more than monkish legends or perversions. With this drawback, we cannot place sufficient reliance on other statements which are borne out by facts, though always more or less coloured by the same credulity. The author is, in other respects, an industrious searcher for truth; and, had he exercised a little more discrimination, we should have been able to speak in higher terms of his laborious undertaking. As it is, we are compelled to dismiss it with this slight

* "By a Treasury order, Guatemala and Colombia tobacco may be imported in packages, containing not less than ninety pounds. East India tobacco may be imported in packages of not less than one hundred pounds. Tobacco from all other places must be imported in packages, cases, or hogheads, if not less than four hundred and fifty pounds net weight. Turkey tobacco may be imported in smaller bags or packages, provided the outer case contains not less than four hundred and fifty pounds net weight. Cigars are not allowed to be imported except in packages or cases, which contain at least one hundred pounds."

* "Shag was at first used to denote generally all kinds of tobacco when cut into thin filaments; though at present it is restricted to the cheapest and worst."

† "A pound of home-made Havannah usually contains about 120; the amount of which at 3d. each is just 3s. The wholesale price of home-made Havannah to the 'trade' is about 14s. per pound."

* "A tobaccoconist's sign about that period was not unfrequently a lighted pipe and a chafing-dish. The sign of the blackmoor smoking, with a roll of tobacco at his feet, is of venerable antiquity, being as old as the reign of James I. The sign of the Highlander and snuff-mill is of comparatively recent date. It seems to have been first introduced by the 'trade' about the commencement of the reign of George III., when the Earl of Bute was what Lord Melbourne is."

notice; though we are free to admit that its merits as a history, and foundations for historians, are more than a compensation for its errors of over-belief.

The Forest Planter and Pruner's Assistant; being a Practical Treatise on the Management of the Native and Exotic Forest Trees commonly Cultivated in Great Britain, respecting which every Useful Information is given. Illustrated by Engraved Figures. By J. Main, A.L.S. Pp. 251. London, 1839. Ridgway.

ONE of the most useful, practical, and valuable works that has been published. It seems to us to be perfectly sufficient for all purposes of instruction, and that planters, gardeners, woodmen, need do nothing else than take Mr. Main's volume in their hand, and attend to its directions in every matter connected with their occupations. If they do so, they will find their work rightly done, and great improvements made in every thing committed to their charge.

Letter to the Queen on the State of the Nation; by a Member of Parliament. Pp. 27. (London, 1839. W. J. Cleaver.) A Pamphlet on the Conservative side, manifesting some sound constitutional principles, and evidently the work of an individual who has enjoyed political opportunities for accurate observation.

LITERARY AND LEARNED.

THE BRITISH EMPIRE IN THE EAST.

By COUNT BJÖRNSTJERNA, the Swedish Ambassador.
(Continued from Page 532.)

3d. *What prospect of stability has the British power in India?*

This extensive question must be considered from two points of view; that of the inward state of British India, and that of its outward political state. With regard to the former, the present flourishing state of this kingdom, the mildness of its government, and the order generally prevailing there, ought certainly to ensure the stability of the British empire; for what better can India wish than the continuance of the present state of things. But he must be indeed ignorant of the human heart who should believe that these advantages, how great soever they may be, should be able perfectly to compensate a nation for the loss of its independence, and reconcile it with the thought of having been conquered, and that too by a nation coming from a great distance, belonging to quite another race, and professing another religion,—a nation which is even considered to be *unclean*, and is avoided by the Hindu as causing *moral contamination*. Besides this general cause, there are several others which more or less contribute to the undermining of the British power in India. Among these may be mentioned the number of deposed kings and princes, degraded governors, *rayas*, nabobs, and zemindars, that are in the country, who, although they are well used by the British government, cannot forget the loss of their *musnuds* (thrones); and they and their followers are therefore ready to take the first opportunity of regaining their regretted power. India is also full of discharged soldiers from the times of the *Mahrattas* and *Pindarries*, who, as belonging to a warrior caste, and besides accustomed to a lawless and wandering way of life, now seek revenge against those who caused their ruin. Neither is the Mussulman population attached to the British government; themselves formerly commanders, see now with regret how this power has fallen into the hands of others, and wish nothing more earnestly than to establish *Timur's* throne in Delhi, and that of *Aureng Zeb* in Agra.

These united causes for fermentation cer-

tainly make the power of Britain in India appear far from being yet perfectly established. *The Hindu race*, which forms the great mass, can, however, be considered as rather attached than disinclined to it, especially the lower castes, whose protector the English government has always been. The fidelity of the army is certain.* The greatest security for the continuance of the British power in India lies, however, without doubt, in the exceedingly mild and easy character of the Hindus (especially among the inhabitants of Bengal, the very pith of the British power); in the *division into castes*; and on their belief in the transmigration of souls. The *castes* prevent the desire of the low-born from aiming at higher ranks in society (a common cause of disquiet in Europe); those in the higher classes consider life as so insignificant a part of their eternal being, that it is not worth while to trouble themselves much about it, and are consequently inspired with a *stoical and slavish indifference*, which promotes obedience to the temporal powers, and prevents the breaking out of insurrection.

The question now is, Whether the elements of stability overbalance the materials for fermentation existing in India? I, for my part, consider this very probable, provided the British government continues to treat India in the same wise and mild way as hitherto, and by degrees prepare the way for the natives to obtain, through ability and merit, a greater share in the government of the country than that at present enjoyed; which extends only to the lowest places in the civil and law department, and the lower in the army.

The power of England over India is a power depending on opinion. Should the Hindu cease to entertain the conviction of the intellectual and moral superiority of the English, it would be impossible for the trifling number of the latter now in India, amounting in all to 100,000 (government, officers of the army, soldiers, tradesmen, planters, &c. &c. included), to retain the government of 100,000,000 of natives, more than half of whom belong to warlike nations. It is, therefore, particularly necessary to endeavour to keep up this power of opinion, which can be done only by means of just government in general, and moral individual conduct. That time must, however, come at last, when a separation will take place, to which the increasing prosperity and enlightenment of the Hindu nation will contribute; for when a nation has arrived at maturity, independence forms the principal object of its wishes. It is at such a period that India, like America formerly, will deliver itself from the colonial leading-strings of the mother-country. That such will be the case must be seen by every thinking Englishman, and seen, too, *without regret*; for England can be great, and powerful, and happy without India, as it has been so without America. Britain has been called by Providence to spread the blessings of civilisation throughout the surface of the earth; she has planted the tender flower on the northern continent of *America*, has afterwards taken it to *Asia's* ancient abodes, and is now preparing its advancement on the extensive coast of *Australia*. To determine the period when the separation

* In the presidency of Bombay, the English officers, dissatisfied on account of some retrenchment that was made, had openly revolted (1790), and refused to march on an expedition against a Dutch colony. The Hindu soldiers would not join in the revolt of their officers, and maintained the strictest fidelity towards the government: such examples of faithfulness are uncommon in every army.

of India from England will take place, is beyond the limits of man's shortsighted glance into futurity; it may take centuries, and it may possibly occur within decennia,—fate alone can determine this; but the probability is, that it is distant. The Anglo-Indian kingdom is still full of youthful strength, it has not arrived at the zenith of its power, and it is not till then that the point of culmination is reached. What would, without doubt, hasten this period, are *outward political circumstances of a dangerous nature; a war against India*,—which, besides its direct influence, might possibly bring with it an indirect effect, that of putting in motion the materials for fermentation already existing in the bosom of India itself, and mislead the dissatisfied there to raise the banner of revolt. Such circumstances affect too nearly the subject now under consideration.—*What prospect of stability has the British Power in India?* to be passed over by me in silence. As, however, the object of my work is rather of a *scientific* than of a political nature, and as I, in other respects, also wish to avoid the latter, I shall, in considering the question, confine myself to the strategical, topographical, and statistical parts of the question, leaving the political as much as possible untouched.

The sources used by me in the execution of this part of my attempt, consist principally of *manuscripts*. The writers are Generals Sir John Malcolm and Sir John McDonald (who have both been British ministers at the Persian court, and have a perfect knowledge as well of this country as of the rest of Central-Asia), staff and engineer-officers, *Bonamy, Pottenger, Christie, Hanky Smith, Crows Ellis, Settons, Williams, Macartney, Hamilton, and Mansfield*, besides *Alexander Burns's* separate memoirs of *Sind, Marwar, Cutch, the river Indus*, and the central countries of Asia.

A glance at the map of India will shew that the boundaries of that country form a kind of irregular square, the south-east and south-west sides of which are bounded by the Indian ocean; the north-east protected by the *Himalaya* and the *Aracanian* mountains; and the north-west by the river *Indus*. The two first-mentioned sides are perfectly free from the possibility of attack so long as England retains the command or superiority at sea; the third side is equally free from attack, partly from the insurmountable chain of mountains forming its boundary, and partly from the weakness of the neighbouring countries, *Tibet* and *Ara*;^{*} there remains, therefore, only the fourth side (the north-western), where *attack can be made*.

It is, therefore, this boundary which we are to examine.

Although the *Indus* forms the north-west boundary of Hindu, it is not that of the *British possessions*, which do not extend so far, finishing partly behind *Sutledge* (with the kingdom of *Lahore* between it and the river *Indus*), and partly on the borders of *Sind*, leaving this country between it and the last-mentioned river.†

In case any threatening clouds should collect in the north-west against the British possessions in India, which, on account of the great preparations necessary, and the distance, which is

* The Birman war (against the king of *Ara*) certainly cost much money, because they were obliged to send all the necessities of life from Calcutta and Madras to Rangoon; but no danger whatever was caused by it to the British government in India.

† *Marwar, Mattru*, as also the possessions of *Schidra*, likewise lie between the *Indus* and the direct territories of the British Company; but as these countries form parts of the British confederation, they are mentioned here as lying within its own boundaries.

very considerable, cannot take place otherwise than slowly, the Anglo-Indian government will probably not neglect to take the necessary precautions; which should especially consist of, either by mildness or force, securing to themselves the attachment of those countries which separate the British possessions from the Indus, making this their natural boundary, to which the British defensive powers must advance if military and political reasons continue to have any influence in the council at Calcutta.*

The Indus being proved navigable for more than 200 geographical miles (see Burns's description), makes it not only an easily defended boundary, but, what is still more important, renders it easier to keep up, and supply, with ammunition, artillery, and other necessities for war, the army collected beyond its banks.

The Anglo-Indian army consists, as we have seen above, of 180,000 men (besides contingent troops), and can easily be restored to its former strength of 240,000. A third part of this army, united with the troops of Runjet Sing and those of the Amers in Sind, offers a force of 100,000 men at the river Indus, which, supplied with all necessities, would form an almost invincible barrier for India.† The second third part of the army (from 70 to 80,000) might, in such a case, form the *line of reserve*, behind the Sutledge and Loony, within the Company's own territory: and the last third remain in the interior of the country to keep all quiet. It is in this position that the Anglo-Indian army might be ready to meet any attempt made on India; and for the sake of still greater security, extend its outposts to Peshawer and the *Soliman* mountains. As the British commander can judge, from the direction of the hostile preparations, on which part of the Indus (the upper, middle, or lower) the attack is intended, he will always have an opportunity of so dividing his own forces as always to meet the enemy at the proper point.

Having now shewn the strategical movements of the Anglo-Indian army, we ought to examine what power could undertake a war against India; and in what manner this power should proceed in order, with any chance of success, to venture on such an undertaking.

In the course of the last twelve or fifteen years the central countries of Asia have undergone so great changes, that the opinions expressed before this time, by men well acquainted with the subject, are no longer applicable.

These countries are Persia with Khorassan and Kirman, which are partially subjected to it; Afghaunistan, Beluchistan, Koondos, Khiva, and Bokhara; and the nomadian nations in Turkomania. All that lies to the west of these countries belongs to Turkey, and has less to do with India; while all on the east of them belongs to China,‡ and forms its own political world.

Of these countries Persia merits, without doubt, the first place. But what a change has not this power undergone within a few years! During the latter part of the reign of its last

* I doubt this so much the less, as the present governor general, Lord Auckland, is a man possessing both political penetration and strength of character.

† According to what is said, Lord Moira's army against the Pindaries, in 1817, consisted of not less than 81,000 infantry, 33,000 cavalry, and 300 field-pieces: how much easier ought it not be, and also, how much more important, in case of a warlike attempt against the Indus, to collect a similar force there now?

‡ Yarkmid, the nearest country east of Koondos, was, not more than twelve years since, conquered by China, whence an army was sent of 80,000 men, most of the soldiers of which were armed with fire-arms, of such a weight that it required two men to carry them. Yarkmid is Mahomedan, as also Khokan, situated to the north of Yarkmid. This latter is governed by Uzbekian Tartars, and has paid for some years tribute to China.

aged monarch (Feth Ali Shach), Abaz Mirsa, his successor, exercised great influence in Persia's council-chamber, hostile to Russia, and friendly towards England. It was he who began the war in 1826 against Russia, ending so unhappily for Persia, which (according to the peace at Turkomanchai, in 1828,) was obliged to give up the fertile provinces of *Eriwan* and *Nahshivan*, and saw the Russian boundary advanced as far as to the river Arras (the Araxes of the ancients), in the neighbourhood of Tabriz, and not far from Teheran, the two principal cities of Persia. Abaz Mirsa died in 1833; and his young son, Mohamed, became his grandfather's successor at his death, in 1834.

Mohamed ascended the Persian throne, protected both by Russia and England, which jointly endeavoured to put aside the claims of his numerous competitors. Sir Henry Bethune, a distinguished English officer in the service of the Shach, contributed, however, most to this happy result.

It could not then with certainty be known what political system the young Shach would follow, and each party hoped to be honoured with his confidence and favour; which of them, however, was mistaken was soon shewn, when the Shach, contrary to the English ambassador's serious representations, began his campaign against Herat, the strongest fortification on the great route to India.

Almost the same injurious change for England has taken place in India as the other neighbouring state, Afghaunistan. Not more than fifteen years since this country formed a powerful monarchy, under the title of the *Caulbul* kingdom, the rulers of which have always been on good terms with the British government in India; but through civil wars, the history of which is too voluminous to be mentioned here, this kingdom has been divided into several principalities, independent of each other. *Caulbul* devolved (1826) on *Dost Mahomed Khan*, brother of the former king's vizier; *Peshawer* has its own governor (*Sirdar*), who pays tribute to Runjet Sing in Lahore; *Kandahar* is under the management of *Kohmidil Khan*, a brother of *Dost Mahomed* in *Caulbul*; Herat alone has remained under the power of the old dynasty, and it is now governed, though weakly, by *Kam-rau*, son of the last king of *Caulbul*. *Ghizne* has obtained its independence, as also have the Amers in *Sinde*, who were before petty princes under the power of the *Caulbul* kingdom. This division of the monarchy of the *Doroneus** has deprived India of the shelter of a power that was friendly inclined, which, invincible in its mountains, possessed, however, no offensive force against British India, and was therefore, in a double point of view, important for it.

The other states of Central-Asia are of much less importance to India than the two last mentioned: *Beluchistan* is inhabited by a predatory people, who rob every traveller, make plundering expeditions to the neighbouring lands, and carry on continual wars between their different khels, or tribes. The *Beluch*, like the Arab and the Turkoman, is always on horseback, and could therefore present a considerable body of cavalry, if their own disagreements did not prevent it. The nominal governor of this extensive country is the khan in *Kelut*, who possesses a kind of feudal government, but is so imperfectly obeyed by his vassals that the khan is almost without power. It is evident that *Beluchistan*, with such a state of society, is incapable of under-

* This was the name of the royal line reigning in *Caulbul*.

taking any thing against the British possessions in India; as it is besides separated from them, as well by the *Soliman* mountains and the Indus, as by the extensive dominions of the Amers in *Sind*.

Koondos has, during the last twelve or fifteen years, considerably increased its power by conquests, which its present king, *Mahomet Moorat Bey*, has made of *Budukhskan*, *Kholum*, *Balkh*, and other places; so that it includes all the northern branches of *Hindoo Koosch*, and thence down to the bed of the Oxus. Its military force is not, however, more than 20,000 men, undisciplined cavalry, without infantry, and therefore of but little consequence against India, from which also *Koondos* is separated by the great natural hinderances.

Next to *Koondos* we find, to the east of the Oxus, *Bokhara* (the ancient *Trans-oxiana*), with *Samarkand*, a tributary to it, a fertile country, but surrounded with sand deserts, and inhabited by a fanatic, Mahomedan people, who have every Christian power. *Bokhara* is governed by *Uzbek Tartars*; and is the staple town for the trade between western and Chinese Asia. Its army consists of 23,000 cavalry, 4000 infantry, and forty field-pieces badly served, and is so much the less capable of undertaking any thing against India as the disposition of the people is rather peaceable than warlike.

(To be continued.)

THE DRAMA.

[Second notice.]

5. *Castille*; or, the *Roman Conspiracy*, has frequently suggested a subject for the drama, and, from Ben Jonson to Dr. Croly, has employed the pens of able writers, both in England and on the Continent. Mr. Reade informs us that his play was composed some years ago, and without his being aware of the existence of Dr. Croly's work; from which it is, however, so dissimilar, that he has no inducement to suppress it on the ground of resemblance. "Each author had taken his own ground and view from *Salust*; and each had, perhaps, equally benefited by the scholastic production of 'rare Ben Jonson'."

Mr. Reade has now printed his *Castille* for private circulation; though, if such publication succeeded at all, he might have ventured it in the usual way; for it reflects no discredit on his muse, and is not unworthy of the author of "Italy" and "The Deluge."

We know not how it is, but Roman story rarely interests us. There is a hardness about the Roman women, and a sternness about the Roman men, in which there is so little of humanity, that we feel no sympathy with either. Where suicide was a triumph, it is impossible to entertain the common sentiments of our nature, and indulge in grief or give way to despair at the bereavements of death. The heroic is a sore enemy to the affections: it may be grand, but it is not touching; it may bring down the thunderbolt of ruin, but not the gentle rain of sorrow. Therefore, let us confess the truth; we have not a tear to shed for *Marcius* on fallen *Carthage*, for *Cato* about to slay himself, for *Sylla*, for *Gracchus*, for *Castille*, for *Brutus*, for *Cesar*, nor for any one of their stamp: *Pompey* certainly is a character to reach our feelings; in the fate of *Antony* we cannot help also taking some concern; and, strange though it may seem, *Lucullus* is one of the very few of our interesting Romans. How is this? Simply because there are weaknesses in their composition which make them brethren of mankind, and not demigods. What's *Hercules* to us, or we to *Hercules*, that we should weep for him?—not even when *Nessus's* horrid shirt drives him to madness.

Mr. Reade has invested his theme with as much of poetry as we could have expected from his former productions; and with quite as much of influence over our sensibilities, as we could anticipate from any catastrophe in *Rome*, among its pitiless senators, bloody conspirators, harsh citizens, and rugged soldiers. He has, for the first time within our knowledge, introduced *Julius Cesar* as a youthful character, and in love with *Fulvia*, the heroine of the drama. Under somewhat similar circumstances, his *Julius* bears a family likeness to *Jaffier*; *Castille*, *Cethegus*, *Crassus*, *Lentulus*, *Petrius*, and *Cicero*, are all drawn with distinctness and force; and the finale is good, both in effect and language.

"Scene VI.—Another Part of the Field.

Alarums: Retreat.

Enter Cato, Petrius, Cicero, and Soldiers.

Cato. Thanks to the gods! the bloody day is ours: Well hast thou fought, brave soldier! and withheld me When I would have retreated from their fury; The senate shall thank thee.

Petrius.

A bloody purchase; And hardly worth the cost, were not Rome's life The stake; for more than half our army's slain;

The rest so wounded they will scarce reach Rome:
The enemy have fallen to a man:
None fled: they fell like pillars in their places,
Covering the spot they stood on with their bodies.
Cicero. Such desperate and determined valour shews
How fixed their resolution.

Catiline (without, and at a distance). Petreus!
Cato. Hark, 'tis the shout of Catiline!
Catiline (without—nearer). Petreus!

[Alarums, and shouts within.]
Petreus. Stand back—and let him have the combat!

[Petreus is left alone in the front of the stage: from the extremity, enter Catiline, mortally wounded; on seeing Petreus, he raises his shield; and staggering towards him, falls dead at his feet.]

Well hast thou played the soldier's part, and died
The soldier's death!

Cicero. A brave, bad man! Behold
How Nature marks his character in death!
See how that swarthy brow still frowns defiance:
How his red hand still grasps his well-hacked sword;
Shewing his will unconquered! Hadst thou been
But half as zealous to support Rome as
Thou wert to overthrow her, thou hadst left
None ranked in virtue higher than thyself.

Petreus. Now let our homeward path to Rome become
Triumphal march.

Cicero. Not so, brave veteran!
For what have we to triumph in? We have not
Fought with our enemies, but friends. Brethren
Have been opposed to each, and sons to sires.
O cursed is that nation when it wars
Upon itself! Whom its own sword has turned
Upon its vitals! There's no greater plague
Can blast a country than a civil war!
Famine and pestilence have bounds; but who
Shall fix the limits of intestine broils?
There's scarce a nation when we see Rome who
Will not demand her son! Her flower of youth
Lie dead: but not a desperate enemy
But purchased many better lives for one.
No: let us shew a decent joy, for we
Have crushed these traitors, and for ever; but
Let it be tempered. Oh! let us respect
The wounds that Rome will shriek with when she hears!
Our cup is mixed; then let us shew the gods
That we can bear, with firm and equal mind,
The good and ill with which they prove our virtue.

We must, however, quote a few other specimens of Mr. Reade's poetry. Fulvia exhorts Cæsar to forsake the conspiracy, and not give way to spleen and bitterness:—

Cæsar. Ay, thou wouldst have me always equable!
Why, the best virtue that becomes a man
Is his humanity; his fellow-feeling.
For sympathies familiar with his own.
Let Cato eat his crust 'till the dark: let me
Feast with a set of hungry rogues around me,
And hear their shouts—they're honest at the time!
If I have made them happy, I feel
The wiser, ay, and better man o' the two!
Nay—if I please thee more, I'll ape the stoic:
Look wise and solemn, and walk clothed in rags,
Shaming the modesty of nature; grudge
My sharp-edged bones the wretched alms
That keeps my life together; and scorn all
Whose ribs are faster than my own! A crust—
A wretch whose bones is never to have smelt:
A dry anatomy; still mumbling out
Beneath a prickly bush of unshorn beard
Sophisms as bare and meagre as his bones!
Or I'll be Ciceronian, and scratch my head
To rouse my wisdom, then in thin, sharp voice,
Pipe out the deeds of Grecian heroes; borrow
Their wits, and sell them for my own; then listen
To my own hired applause.

A speech of Catiline, as a match:—

Cæsar. But if we fail—
Catiline. In the best cause that ever called on man
The failure stamps it worst. If we succeed,
When will the herd be tired with praising us?
What's vice and virtue, but names given to deeds
That men or love or hate as they affect
Themselves; and which change names and characters
With circumstances and manners? No,—'tis Power
Men bow to—ruling and inspiring Force!
It makes vice, virtue, all is overleaked,
All,—in the dazzling heights which it hath won!
Men are not to be loved,—they mock ye; nor
Be courted,—they despise ye,—they must fear!
They're born to be commanded; and they own
Instinctively the master-mind! They may
Hate, but dare not despise. Power is the giant,
And fear and flattery are his abject courtiers!
Let us gain that, and with the mind to plan,
The hand to dare, what can we not attempt?"

Now for—

Cato. They never fail who strike for liberty!
They may be crushed; but they are not forgotten:
They leave their names as watchwords to inspire us
On through the glorious breach in which they fell!
And so they triumph even in death.

And—

Cicero. The morrow's dawn—and we shall be in Rome:
Masters of fate, and of our enemies;
Or sleep too well to know all we have lost."

These are fair examples. The plot, of course, follows the history, and Mr. Reade has by no means improved by causing the discovery of the conspiracy to depend on finding its objects stated, and a list of the conspirators in a scroll lying at the feet of a sleepy or drunken "Hall Porter."

6. *Festus* we should have excepted from a list of dramas for the stage; and shall therefore reserve it for a separate review. It is an extraordinary production, out-Herding Kant in some of its philosophy, and out-Goetheing Goethe in the introduction of the three persons of the Trinity as interlocutors in its wild plot. Most objectionable as it is on this account, it yet contains so many exquisite passages of genuine and glorious poetry, that our admiration of the author's genius overpowers the feeling of mortification at its being misapplied and meddling with such dangerous topics.

VARIETIES.

The Daguerrotype.—Although the Daguerrotype does not comprehend a single manipulation which every body does not understand, and although it does not presume any knowledge of drawing, still it requires a certain manual dexterity in order to reach the proper point in every part of the operation. We are not surprised, therefore, that at the same time that M. Daguerre is about to publish a detailed account of his discovery, it is also his intention still more completely to initiate, by a kind of practical course, all those who desire to avail themselves of his process.—*La Quotidienne.*

H. B. Caricatures.—"The Road to Ruin" (No. 610), a barouche, containing the Queen, Lord Melbourne, Lord Normanby, &c., going at a fearful pace down the hill of Concession and Reform. "The leading horses are managed, or rather are unmanageable, by Lord John Russell. The beast he is riding bears the face of O'Connell. The wheelers are under the guidance of Spring Rice, who, in evident fear, is exclaiming, to his brother-postilion, "Hold hard, Johnny!" The reply, "I can't," causes the Queen to ask the premier whether "We are not going down the hill very fast?" Lord Normanby confesses that "We are going faster than is agreeable;" while Lord Melbourne, glancing over his shoulder, perceives, that "We cannot stop until we get to the bottom."—"Practising for the Tournament" (No. 611), was sure to furnish a subject for H.B., and a very humorous group he has made of it. To the left, the House of Lords is overthrowing the House of Commons (both represented by knights, caparioned and mounted, and tilting over the barrier, "Ireland"). Lord John Russell and O'Connell are the squires, watching the result of the contest. To the right, Lord Brougham is carrying away the ring on the point of his spear; and, in the background, Spring Rice is knocking the dummy (represented by Lord Durham) off his pedestal. Both caricatures are in H.B.'s best style.

Laurent de Medici.—The tragedy of "Laurent de Medici," so long in preparation and interdicted by the police, was at length produced, and with success, at the Théâtre Français, on Saturday night last. The author, M. Bertrand, was proclaimed with the usual écolat.—*Paris News, from the Times.*

Landslip.—On the 18th of June, a remarkable displacement of an entire valley, near the foot of a mountain, took place at the village of Federowk in Russia; and during seventy-two hours it moved with an undulating motion towards the river Volga. The sinking of the valley is one mile and a half long, and 280 fathoms in breadth. Above seventy houses were damaged or thrown down, but happily no lives were lost.

The Inventors' Advocate, No. 1.—A new weekly contemporary, embracing a very wide field of arts, sciences, and literature. The principal feature is the record of patent inventions,

both domestic and foreign. This will be a useful guide to projectors and inventors; and any suggestions to improve our patent laws are also very desirable. We have little right to advise in such cases; but we should think the more space that can be given to these matters, and the less taken up by literary novelties and amusements unconnected with them, would be all the better.

The Minister of the Interior has addressed a circular to the Prefects of Departments, enjoining them to pay the greatest attention to the preservation and classification of all the archives of their respective districts. Where the collections of documents are sufficiently important or extensive, he recommends the appointment of regular archivists to be paid by the state; he orders all the collections to be catalogued, and kept in properly constructed buildings, subject to due inspection; and he forbids any paper whatever belonging to such collections to be destroyed or sold without his permission.—*French Paper.*

Roman Remains.—Some important and interesting Roman remains have lately been discovered on the banks of the Scheldt.

LITERARY NOVELTIES.

LIST OF NEW BOOKS.

Lives of Eminent, Literary, and Scientific Men, of France, 2 vols. fcap. 6s. Rain fallen, 0.75 of an inch.

Edmonton.

CHARLES HEVAT ADAMS.

TO CORRESPONDENTS.

We have this week devoted as much of our space as was convenient to the proceedings of the British Association. It requires some time to sift these multifarious matters, and separate the new and useful from the well-known and unimportant. To this we shall append ourselves in future Numbers; but do not forget that we shall have to trespass at very great length upon other departments of our Gazette in recording the facts and results without touch of the contradictions and arguments.

ADVERTISEMENTS,

Connected with Literature and the Arts.

THE MODEL OF THE BATTLE OF WATERLOO is now EXHIBITED at the Egyptian Hall, Piccadilly, by brilliant Artificial Light. Constantly illuminated from Four o'Clock in the Afternoon, and throughout the day in dark or unfavorable weather.

Open from Ten in the Morning until Nine in the Evening.

Admission, One Shilling each.

PRIVATE TUTOR.—A Clergyman, for some Years Tutor to a Nobleman, and subsequently receiving Six Pupils into his House, a moderate distance from London, would be glad to fill a Vacancy with a Gentleman's Son, whose Education or Health may require more than common care. Letters, addressed to the Rev. J. C. Post Office, Hampton Court, Middlesex, will be forwarded to him.

ROYAL INSTITUTION OF GREAT BRITAIN,
Albion Street, Sept. 1st, 1850.

THE Extended and Practical Course of Chemical Lectures and Demonstrations for Medical and General Students, delivered in the Laboratory of this Institution by Professor Brande, will commence on Tuesday, the 8th day of October, at Nine in the Morning, and be continued on Tuesdays, Thursdays, and Saturdays, at the same hour.

For a Prospectus of the Lectures, and Terms of Admission, application may be made to the Lecturer, or to Mr. Fischer, at the Royal Institution.

JOSEPH FINCHER, Assistant Secretary.

PAINTING AND MUSIC.

In post 8vo. price 6s.

PAINTING and the FINE ARTS.

By R. R. HAYDON and WILLIAM HAZLITT.
"Mr. Hazlitt's clever treatise, written for the 'Encyclopædia Britannica,' has come under our notice. We have read no work of that author with any thing approaching to the same gratification."—*Quarterly Review*.

"This inimitable dissertation on painting,"—*The Magazine*.
"We have mentioned the gratification we have experienced from the perusal of Mr. Hazlitt's Essay; we must add a similar testimony in favour of his fellow-labourer, Mr. Haydon. His treatise seems to be the result of study and observation extensive and profound."—*Quarterly Review*.

In a handsome vol. 4to. price 9s. with numerous Engravings, and copious Musical Illustrations interspersed with the Text.

AN ESSAY ON THE THEORY AND PRACTICE OF MUSICAL COMPOSITION
with an Appendix and Notes, being an extension of the Article "Music."

By G. F. GRAHAM, Esq.

"A masterly and comprehensive Essay."—*Athenæum*.
"We never saw so much sound practical information on the subject compressed into the same space."—*Spectator*.

"A lucid and harmonious arrangement of the principles of the art."—*Musical World*.

Complete for 4s. with Portrait, forming the New Volume of Colburn's Standard Novels.

Henry Colburn, Publisher, 15 Great Marlborough Street.

WORKS JUST PUBLISHED BY LONGMAN, ORME,
AND CO.

BY COLONEL HAWKER.

INSTRUCTIONS TO YOUNG SPORTSMEN.

8th edition, greatly enlarged, with 60 Plates, &c.
3s. cloth.

"Replete with that species of information which every man who desires to know what he is about in the field will deem essential to success, and without which he must share the fate of all novices."—*Bell's Life in London*.

"We can conscientiously recommend it to every sportsman, and to every one anxious to become a sportsman, as being immeasurably superior to any we have ever perused in every particular."—*Age*.

Lately published,
Greener on the Gun. 15s.

BY CAPT. MARRYAT.

A DIARY IN AMERICA.

3 vols. post 8vo. 3s. 6d.

"These three volumes contain a great deal that will please all readers."—*Times*.

"The most agreeable book we have yet had on America."—*Examiner*.

THE WORKS OF

THE REV. SYDNEY SMITH.

3 vols. 8vo. price 96s. cloth, lettered.

MR. JAMES'S LAST NOVEL.

THE GENTLEMAN OF THE OLD SCHOOL.

3 vols. post 8vo. 3s. 6d.

"We have read these volumes, not only with unflagging, but increasing interest, from the first page to the last."—*Cont Journal*.

"There are always sterling passages, clothing original conceptions of character, interweaving with inexhaustible profusion happily contrived incidents, or volunteering shrewd and striking observations, in Mr. James's notions."—*Monthly Review*.

By the same Author,

LIFE OF EDWARD THE BLACK PRINCE.

2d and cheap edition, 3 vols. fcap. 15s.

"An extremely next second edition, and accordingly in a form well calculated to extend the popularity of a work the intrinsic merits and interesting subject of which would make it popular in any shape. Mr. James has done every justice to it."—*Literary Gazette*.

"The most popular, most complete, and most interesting account of the Black Prince that we have seen."—*Athenaeum*.

BY MISS MARY LOUISA BOYLE.

THE FORESTER.

3 vols. post 8vo. 3s. 6d.

"Miss Boyle has masterfully grappled with her difficult subject, and brought out her historical actors with remarkable truth and touching sympathy. We like her better than the imaginary characters, and this implies an uncommon achievement."—*Monthly Review*.

"These are very delightful volumes, and alone entitle the authors to take a high rank among the novelists of the day. There are many passages of exquisite tenderness and beauty, which glow with the bright colouring of truth and poetry."—*Eds.*

BY LADY BLESSINGTON.

DESULTORY THOUGHTS AND REFLECTIONS.

Fcap 8vo. 4s. cloth, lettered.

"We have seldom seen a more alluring volume, either in external beauty or inward wisdom; and we confidently recommend it to our readers, as an instructive exponent of the hidden deformities of society, and a key to its apparent incongruities and follies. As a manual for occasional reading, it will be both beneficial and entertaining, for the terse and well-directed aphorisms it contains are as remarkable for their moral value as for their elegant and graceful setting."—*Conservative Journal*.

"A beautiful little volume externally, and full of rich morsels, sweetly compressed, of thought and reflection."—*Monthly Review*.

BY DR. SIGMOND.

TEA: ITS EFFECTS, MEDICINAL AND MORAL.

Fcap 8vo. price 5s. cloth.

"This volume of Dr. Sigmond abounds in matter of instruction relating to the tea-plant, communicated to the reader in a most pleasant style, and will supersede, with the public, the necessity of examining the scarce volumes and large parliamentary folios from which alone so much instruction could be collected."—*Leader*.

"Dr. Sigmond has given all the knowledge that could be gleaned in a popular form, and has contributed a volume of great utility to the class of knowledge which he has before assisted in improving and enlarging."—*Berning Herald*.

BY GEORGE ROBERTS.

ETYMOLOGICAL and EXPLANATORY DICTIONARY OF THE TERMS and LANGUAGE OF GEOLOGY.

Fcap 8vo. 5s. cloth, lettered.

"So full, accurate, plain, and intelligible, in the derivation and interpretation of terms, and so complete in all points necessary to the clear comprehension of the entire subject, that it must remove the difficulties with which this study has been hitherto beset."—*Athenaeum*.

"The derivations of each word are very distinctly marked; the explanations are clear and sufficiently full."—*Spectator*.

REPLY to Mr. LOCKHART'S PAMPHLET,

entitled, "The Ballantyne Humbug Handled." By the Authors of "A Refutation of the Misstatements and Calumnies contained in Mr. Lockhart's Life of Sir Walter Scott, Bart. respecting the Messrs. Ballantynes." London: Longman, Orme, and Co. Edinburgh: A. and C. Black.

THE OPIUM TRADE.

THE ASIATIC JOURNAL for September, contains—Intelligence from India to July 4; and from China and Australasia to a late date, including the whole of the Proceedings at Canton respecting the Annihilation of the Opium Trade—Entry of the British Army into Candahar—A curious Autobiography of Shah Shooja—Expedition into the Interior of South Australia, &c. &c. London: Wm. H. Allen and Co. 7 Leadenhall Street.

In demy 8vo., price 1s.

SUGGESTIONS to AMATEUR ARCHITECTS.

"Without pretending to give a decided opinion on the subjects of which it treats, we hesitate not to recommend the 'Suggestions to Amateur Architects' to the notice of those for whom it is especially designed. Independent of its style, which is very perspicuous, we conceive the observations to be very judicious, and such cannot fail to command attention from all these into whose hands the work may fall."—*Liverpool Mercury*. London: Simpkin, Marshall, and Co.; and Egerton Smith and Co. Liverpool.

ARMY AND NAVY.

The September Number of the UNITED SERVICE JOURNAL, and NAVAL and MILITARY MAGAZINE, contains, among other interesting papers—

The Naval Gunners Establishment, St. Helena in 1836. By Lieut. Stuart.
Passages in the Life of a Sailor.
Memoir of the late Gen. Lord Gen. Sir G. Napier. By Major Charters.
Working of the Coast Blockade Service, with Anecdotes of Snagging.
Memoirs of E. Castello.
Records of an Expedition up the Quorra, with Landers.
Capt. Allen, R.N.
Intelligence of the Month.
Henry Colburn, Publisher, 13 Great Marlborough Street.

ILLUSTRATED WITH TWO ETCHINGS BY BUSS.

The September Number of COLBURN'S NEW MONTHLY MAGAZINE and HUMORIST, Edited by THEODORE HOOK, Esq., contains

The Planter's Birthday. By the Editor.
The Widow Married. By Mrs. Trevelyan.
Translations by R. W. Buss.
Issue Moss. By Douglas Jerrold, Esq.
A Sir among the Letter- Writers.
The Clause in the Will. By the Author of "Rattlin the Reefer."
Snuff and Snuff-Takers.
The Pugilists.
The Man Eater. By the Old Forest Ranger.
A Morning Conversation in Berkeley Square.
Sketches of Italy, Italy, and the Tyrol, by the Rev. G. R. Gieg.
The Life and Times of Peter Frigins.
Close of the Monsoon. By Major C. Campbell.
Tristram Dumps.
A Fair Shot. By Miss Sheridan, &c. &c.

Henry Colburn, Publisher, 13 Great Marlborough Street.

8 New Burlington Street, August 20.
MR. BENTLEY has just published the following NEW WORKS:—

I. Ireland: Social, Political, and Religious. By Gustave de Beaumont.

Edited by W. C. Taylor, LL.D. 3 vols. post 8vo.

II. Mr. Theodore Hook's Jack Brag. Complete for Six Shillings, forming the New Volume of The Standard Novels and Romances.

III. Victories of the British Army. By the Author of "Stories of Waterloo." 3 vols. 8vo. with characteristic Illustrations and Portraits.

IV. Confessions of a Thug. By Captain Mayne. Of the Service of His Highness the Nizam. 3 vols. post 8vo.

V. The Hon. C. A. Murray's Travels in North America. Including his Summer Residence with the Pawnee Tribe of Indians. Dedicated, by special permission, to the Queen. 2 vols. 8vo. with Plates.

Also, just ready, THE CONCLUDING VOLUMES OF THE Memoirs of Charles Mathews, Comedian. By Mrs. Mathews.

(Vols. III. and IV.), with numerous characteristic Illustrations and Portraits.

Richard Bentley, New Burlington Street, Publisher in Ordinary to Her Majesty.

THE METROPOLITAN

The New Number of for September will contain—

- Sketches of Jerusalem. By G. Shakspeare Fancied, No. VII.
- C. G. Addison, Esq. of the Inner Temple.
- The Blind Reeler Afloat. By C. Howard, Esq. Author of a Melodist for Music. By T. J. "Rattlin the Reefer," &c. Ouseley.
- The Banquet's Mirth is over. Lord Killikelly. By Abbot Lee.
- By Mrs. C. Baron Wilson.
- A Pigeon from Fontainebleau. By Mrs. Harriet Pigott.
- The Warrior's Betrothed.
- Reviews, Notices of New Books, &c. &c. Saunders and Ouley, Conduit Street.
- Agents—for Ireland, J. Cumming, Dublin; for Scotland, Bell and Bradfute, Edinburgh; and Smith and Son, Glasgow.

ON the THEORY OF EQUATIONS.

By W. HOYLE. London: Sherwood, Gilbert, and Piper, Paternoster Row.

In fcap 8vo. price 5s. illustrated with a Portrait and Vignette, Vol. IV.

THE WORKS OF MRS. HEMANS.

Contents: The Forest Sanctuary—Lays of Many Lands—Miscellaneous Pieces—Dartmoor (a Fable Poem)—Walthamstead—Hymns for Childhood—De Chastillon, or the Crusaders; a Tragedy—Miscellaneous Pieces. William Blackwood and Sons, Edinburgh.

THE BRITISH and FOREIGN REVIEW, No. XVII.

Contents: 1. Waagen on Art in England: Pictures and Pictures-Cleaners. 2. A Rural Police. 3. The Corn-Laws. Hungary and the Baltic. 4. Wheaton on the Law of Nations. 5. Lamartine's Poems. La Chute d'un Ange. 6. England, Austria, and Turkey. 7. The State of the Nation. The Chartists. 8. Church and State. The Russian Great Church. London: R. and J. E. Taylor, Red Lion Court, Fleet Street. Edinburgh: A. and C. Black. Dublin: J. Cumming.

ECCLESIASTICAL BIOGRAPHY; or,

Lives of Eminent Men connected with the History of Religion in England; from the Commencement of the Reformation to the Revolution. Selected and illustrated with Notes, by the Rev. CHRISTOPHER WORDSWORTH, D.D. Master of Trinity College, Cambridge; and Rector of Buxted with Uckfield, Sussex.

3d edition, with a large Introduction, some new Lives, and many additional Notes. Printed uniformly with the "Christian Institutes," by the same Editor, J. G., F., and J. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

NEW FEERS. DEBRETTS' COMPLETE PEERAGE of the UNITED KINGDOM.

Improved by WILLIAM COUTHOPPE, Esq. The 23d edition, including the New Peers created at and since the Coronation, with a Portrait of Her Majesty, beautifully engraved by Dean, and the Arms (now incorporated with the Text) from Designs by Harvey. In 1 vol. price 96s. in extra cloth. J. G., F., and J. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

A NARRATIVE of the DISCOVERIES of

SIR CHARLES BELL in the NERVOUS SYSTEM. By ALEXANDER SHAW, Assistant-Surgeon to the Middlesex Hospital. Longman, Orme, and Co.

IN 8vo. price 7s. 6d. in cloth boards. PRACTICAL INTRODUCTION to

LATIN PROSE COMPOSITION. By THOMAS KERCHEVER ARNOLD, M.A. Rector of Lyndon, and late Fellow of Trinity College, Cambridge.

J. G., F., and J. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

* * * This work, like the "Practical Introduction to Greek Prose Composition," by the same author, is founded on the principles of imitation and frequent repetition. It is at once a Syntax, a Vocabulary, and an Exercise-Book; and considerable attention has been paid to the subject of Synonymes.

IN 18mo. price 2s. in cloth boards. HENRY'S FIRST LATIN BOOK.

* * * The object of this work (which is founded on the principles of imitation and frequent repetition) is to enable the pupil to do exercises from the first day of his beginning his Accidence.

By THOMAS KERCHEVER ARNOLD, M.A. Rector of Lyndon, and late Fellow of Trinity College, Cambridge.

J. G., F., and J. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall; and Simpkin, Marshall, and Co.

* * * Four pages have been recently added to the Index, which may be had by previous purchasers.

Printed by HANNAH PAGE MOYES, of Brook Green, Hammer-smith, and GEORGE BARCLAY, of Number 3 Pall Mall Place, in the County of Middlesex, Printers, at their Printing Office, Number 38 Castle Street, Leadenhall Square, in the said County; and published by WILLIAM ARNOLD'S SCRIPPS, of Number 13 South Molton Street, in the Parish of Saint George's Hanover Square, in the County aforesaid, at the LITERARY GAZETTE OFFICE, Number 7 Wellington Street, Waterloo Bridge, Strand, in the said County, on Saturday, August 21st, 1853.

THE BRITISH ASSOCIATION.

NINTH MEETING: BIRMINGHAM.

[Second Notice.]

BEFORE we proceed with our Report of the Proceedings of the British Association, we will offer a few remarks on the increased hostility and ridicule with which it has this year been assailed; and which, if we may judge from the frequent allusions to the subject, have made a considerable sensation. The question of Religion has been introduced by the Dean of York and a number of writers in religious periodicals; whilst several of our ablest and most powerful journals have attacked the Association on the grounds of its inutility in the cause of Science,—its vain-gloriousness, its gormandizing, and even its corrupt and jobbing administration.

Upon these points, having attended all the meetings since that of Cambridge, and been observant of every point connected with them, we are induced to submit our honest testimony and candid opinion to the public.

On the polemical controversy, which appears to have been excited, chiefly, if not entirely, by the Geological Section, and by publications among the "Bridgewater Treatises" and elsewhere, too much has been said and written to render its revival, and the answers here given, on so many occasions, to the impugnors of this science as being infidel, unchristian, and at war with Scripture and revelation, of any high degree of importance to the religious world. All that the friends of geology could do, was to dress in other phrases the arguments they have already, with so much ability, supported through the press; and it is not to be supposed that after-dinner speeches, or those of routine and compliment, are likely to be so powerful on so grave a matter as the mature reflections and compositions of the closet. They were proper and sufficient for the audiences to whom they were delivered, but if repeated in our reports, could not have so much weight with the surrounding and distant world as those which have been already circulated universally amongst every class of readers who concern themselves with the dispute. In some of our notices will be found the most pithy observations made by Mr. Vernon Harcourt, the Marquess of Northampton, Dr. Buckland, &c.; and we will not further involve ourselves in the unprofitable discussion, from which so little of good is promised to the faith in which the people of Great Britain live and worship their Creator. If the attacks have been intolerant and ignorant, as surely those which we have seen and heard have generally been, it has caused us some surprise to find that they are so sorely felt. We cannot tell whether religion is likely to suffer most from its assailants or defenders! If Bible history, and its superstructure of Christianity, can be overturned by the discovery of an Ichthyosaurus or an Encrinurus, a tree fern or a sponge, their vindication is a folly, and their foundations, instead of the solid rock, are on a stratum of shifting sand.

With regard to the advantages which science has derived, and is destined to derive, from the meetings of the Association, if too much is not

demanded on that score, a person must be prejudiced and blind beyond credibility to deny their beneficial influence. The collision of a number of clever men, the friction of their minds, could not take place without stimulating, informing, and improving every one of them. The general interchange of their ideas must of necessity produce a good and a great effect; which could never be produced by the study of their productions, even allowing that these were made accessible to, and could be consulted by, all. It is personal contact which spreads and infuses vigour into these communications, and there is no setting a limit to the possible and probable results of such intercourse. Another recommendation, and a gratifying one, is the generation of friendly and kind feelings among so many engaged in similar pursuits, who would never have known any thing of each other but for the British Association. Their consequent correspondence is another source whence science must be aided and advanced. We are bound to say, that we never witnessed less of jealousies and more of cordial co-operation among men than at these meetings. In the higher branches of knowledge, the former does not seem to exist, and the latter is freely given; and even in these divisions, where individual interests come directly into conflict, there is really, in general, more to praise than to reprehend. It is true, when people have patents to defend, on which immense profits are expected; or rail-roads to puff, in which they are largely embarked; or inventions to get into notice, which will reward their ingenuity; or manufactures to exalt, by enhancing the fame and value of which they will fill their pockets, there is quite as much of human frailty and human selfishness exhibited at the British Association, as in the transactions of trade and business elsewhere. This cannot be avoided, but it is not the prevailing feature; and where there is sterling gold, it would be unjust to quarrel with the small quantity of alloy.

We do not mean to affirm that the doings in the Sections, the extempore and often verbose debates, the questions and suggestions of parties who occupy the time by interruptions of the most irrelevant description, and its like occupation, or rather waste, by trite and familiar matters, which have already passed through the London Societies, and been promulgated by the publications devoted to these pursuits, are either the best portions of the proceedings, or of use to science. Some more care is advisable in respect to them; and the sectional committees might accomplish reforms in regard to these blots.

But the most important work of the Association is the annual collection of views, in which the progress and existing state of the sciences are traced and laid down for the guidance of every soul engaged in their study. Here they find land-marks by which to be guided; by which they are prevented from following erroneous courses, and saved the trouble of travelling over grounds already explored and occupied. We must acknowledge that this is an immense service to science; and we have only to look at the volumes published by the

Association, to have sufficient vouchers for this truth.

The procurement of the Antarctic Expedition, alone, would be an answer to the cry against the Association for trifling and inutility. Suggested by Major Sabine, the Association took it up heartily, and backed by the influence of the Duke of Northumberland, and the Marquess of Northampton, President of the Royal Society, all the delays in government movements were overcome, and this most interesting voyage is now in actual progress under the happiest auspices.

The other charges against these meetings are hardly worth combating. The harmless flatteries which occur in the oratory, and the inclination to lay hold and boast too much of trivial things in favour of the Association and its leading characters, are only the *soft solder* of the machine, and do not impair its real value. The gormandizing is an exaggeration of the hospitalities enjoyed by the members, which, though generously and profusely bestowed by the various localities to which they have been invited, never led to intemperance or any unbecoming act. It is a sad mistake to fancy that the philosophical and social are irreconcilable. On the contrary, their union is one of beauty and benefit; the philosophical adorns and exalts the social, the social cheers and animates philosophy.

There is another good result arising from these meetings, which we ought to notice before saying a few words on the imputation of jobbing; we mean the intelligence received by the members respecting things with which they were unacquainted, in return for the knowledge and impulse communicated by them to the quarters to which they have gone. The inspection of many manufacturing and mechanical processes, and the examination of mines and natural products, are of infinite use in the cultivation of the mind; and the stimulus given to the industry and inventiveness of the districts where the Association has held its annual concourse, has been made apparent in so many instances that it would be absurd to insist upon it. Our last and present Numbers furnish proof enough to satisfy every sceptic. The drawbacks of bustle and want of time, though they are felt as evils, do not hinder the working of the system to much that is of individual and national advantage, both as relates to commercial and scientific objects.

We now turn to the last point of objection, which has been embodied and advanced by our influential contemporary "The Times" newspaper. We are convinced, that had the writer been present at any of the meetings, or had he impartially analysed the accounts and expenditure of the Association from first to last, the conclusion of his auditing would have been

"It is impossible that any reporter not acquainted with all the subjects can give an accurate narrative of the lectures and discussions; and an inaccurate one is worse than useless—it puzzles and misleads. Besides, we have, we confess, a great contempt for this mode of dispensing knowledge, where beef and botany, champagne and chemistry, geology and goose-liver pies, are discussed together, to the great confusion of the digestive faculties both of the intellect and the stomach. We have felt from the beginning that there is a great deal of folly and humbug in the concoction and subjects of this pretended Scientific Association; and latterly, we have had reason to

directly the opposite. The grants of the Institution are before the public, and when it is seen that in eight years a fund and property of above 6000*l.* have been accumulated, they cannot be deemed prodigal. The two or three official salaries are very small, and far below the average of service; the mass of the business being performed gratuitously and without reward. The sums placed at the disposal of individuals for scientific purposes have been economically employed, and always within the bounds limited; and with respect to the objects aimed at, it is scarcely possible to throw a doubt upon their utility, or a suspicion upon their motives.

And when we look at the persons who have taken the lead in the Association, and have adhered to it through good and evil report, can we doubt either its intentions, its conduct, or its efficacy? Its presidents and vice-presidents have been men of all parties, and of the highest honour and distinction. At its meetings, the four great national universities of Oxford, Cambridge, Edinburgh, and Dublin, have been constantly represented by their chief ornaments; and the University of London, King's College, Durham University, Aberdeen, Glasgow, St. Andrew's, have all taken active and prominent parts in the measures adopted. Nor have the most eminent philosophers in the grand Republic of Science been absent from this her parliament: on the contrary, so vast a majority of the highest have lent their efforts to the design, that it would be very difficult to make out a short list of absentees belonging to that class.*

The attendance and approbation of foreigners of universal reputation is another strong proof of the value of this Association. To their estimate of its extreme importance we can bear our own testimony; for we have often heard it from the mouths of those with whose fame all Europe rings.

Another incidental point may also be adduced; viz. its tendency to bring forward modest merit, which would otherwise be doomed to bloom unseen, and wither in the desert air. Who can tell what future Watts, Peels, Arkwrights, and Smeatons, may be the fruit of these cheering opportunities? Already in the ranks of the Members are enrolled some gratifying instances of celebrity, cherished into an extended sphere of usefulness by its nourishment; and the seeds have unquestionably been sown of many more examples of the same auspicious order. At the close of our Report of the present meeting we may probably glance at the items voted, and fairly canvass them in support of these facts.

Pursuing our usual course of abridging what can be abridged with advantage, and winnowing the new and useful from the theoretical and unproductive, in the Proceedings of the British Association, we revert to Monday, in order to fill up the gaps we left in its Report, so as to make room for papers afterwards read;

think that there is something worse—we mean, that gross jobbing has tainted the administration of the Society. We shall, perhaps, have occasion to say a few words on this subject. Meantime, we shall conclude by quoting the words of a friend, that 'the systematic concealment of important information from those who are called upon to decide, and the support which men of high character and station have, by cajolery, been duped into giving to contemptible measures, have disgraced the Society, and paralysed all its powers of usefulness. We believe that Sir John Herschel, Mr. Babbage, and Mr. Sedgwick, among others, have withdrawn their countenance from the Association.'—*The Times*.

Of the three names mentioned as reported deserters by "The Times," Sir J. Herschel and Professor Sedgwick certainly continue among the warmest friends of the Association.—*Ed. L. G.*

and which we considered to possess more public interest and general importance.*

In Section B, on Monday, the papers appointed for which were all we could indicate, Professor Graham took the chair, and opened the proceedings by taking a view of recent improvements in chemical science. He particularly pointed attention to the great talents displayed by M. Schönbein, of Basle, in that important branch of science, "Organic Chemistry," and expressed a hope that the meeting would be favoured with the presence of that distinguished foreigner. The learned chairman also animadverted on M. Dumas's "Law of Substitutions," the source of so many valuable discoveries. The first experiment was with chlorine on organic matter; and it was found that an atom of chlorine was substituted for every atom of hydrogen, separated in the form of hydrochloric acid. In the same manner oxygen substituted itself for hydrogen in acetous fermentation; and chloro-acetic acid substituted chlorine for oxygen. The discoveries and experiments of Faraday in regard to the chlorides of carbon, also pursued by M. Regnault, and the binary theory of M. Leibig, were alluded to, as beautiful examples of chemical progress. The prohibition, or nearly so, of the exportation of sulphur from Sicily (our principal mart) was noticed; and the Professor spoke in praise of an invention of Mr. Gossage, of Stoke Prior, near Birmingham, for the reduction of this material, so important to chemists and manufacturers, from soda waste.

Professor Hare's paper possessed no novelty, and has already been published and reviewed.

Mr. Mallet's letter simply stated, that he was continuing his Experiments on the Action of Water on Cast-iron, and would require, therefore, a continuation of the 50*l.* grant made by the Association last year.

The communication from Dr. Boswell Reid, of Edinburgh, accompanied a chemical instrument, which, by mechanical arrangement, shewed the composition of different substances, and which greatly resembled the numerical machines, formed of wood and wire, employed for calculations in China. Some improvement was suggested by Dr. Daubeny.

Mr. Coultupe explained his Improved Method for graduating Glass Tubes for Eudiometrical Purposes, which Professor Graham thought might be equally useful for medical measurements. Also another Air Apparatus, for determining the quantity of carbonic acid in

* "The Times" is quite right in its opinion that attempted reports of all these proceedings, taken at the various Sections, must of necessity be very inaccurate, and lead to error, rather than accurate intelligence. But, still, a considerable portion of them may be obtained, and preserved in a way to render them valuable to science, both at home and abroad. Discrimination is necessary: and we would meddle with none except such as would convey correct information. Why engross our pages with repetitions of subjects, experiments, essays, &c., already familiar to the world, either from newspaper publicity, or the details of the London Societies, which have appeared in so many shapes? But such matters as Mr. Fox Talbot's explanations on photogenic drawings, and Mr. Daguerre's process (see our last No., p. 545); Mr. Lyell on the chalk and gravel formations, in Section C. (*Ibid.* p. 548); Mr. Hawkins on paving—an immediate practical question (*Ibid.* p. 549); Mr. Webb Hall on accelerating the growth of wheat—the only agricultural paper at the meeting, and one of the utmost importance (*Ibid.* pp. 550-1); Dr. Thomson on indigestion—another subject of universal interest (*Ibid.* pp. 551-2); Mr. Grove on the voltaic battery—also taken out of the routine order (*Ibid.* p. 553); and Mr. Murchison's valuable geological communication on the carboniferous and Devonian systems, in Westphalia and the north of Germany: such matters, we repeat, being fully and accurately given, must exercise a very instructive influence on the public mind. We shall merely notice that Mr. Murchison's abstract ought to have been among our supplementary papers (after col. 3, p. 550), and not immediately under the head of "Evening Meeting."

the atmosphere, which did not seem to be so much approved as Dr. Dalton's; and several gentlemen present mentioned contrivances of their own for the same object.

Dr. Mackay read 'A Communication upon a Bark which he had lately received from South America.' He stated that, in a brief sketch of its reputed virtues which accompanied it, it was said to possess febrifuge properties in an eminent degree, which was rendered exceedingly probable from its containing a bitter principle in considerable quantity. Its febrifuge qualities are stated to be equal to those of the best Peruvian bark, for which it has been successfully substituted. Dr. M. submitted to the inspection of the Section specimens of two different oils, obtained from the bark by distillation with water, which, though existing in the same plant, and obtained by the same process, present marked distinctions. The one, being of less specific gravity than the other, floated upon the surface of that which was distilled along with it, while the other being considerably heavier, sunk to the bottom of the receiver. Both, when fresh, were transparent and colourless; but in a few days they changed to a yellow colour, the heavier oil becoming of a deeper tinge than the other. In smell the oils differ perceptibly, that of the heavier being fatty and unpleasant, while the odour of the lighter is aromatic and agreeable. In taste they are equally acrid and disagreeable. The specific gravity of the lighter oil is 0.949, that of the heavier is 1.028, both having been examined several days after their preparation. Upon exposing them to a temperature of 18° F. no effect was produced upon the lighter oil, but in the heavier a great quantity of needle-shape crystals were observed, which, however, speedily dissolved upon the phial being removed out of the febrifuge mixture: the mineral acids decompose them, connecting both oils with fluids of a blood-red colour. In a chemical point of view the oils referred to are interesting, on account of their presenting such marked distinctions in colour, smell, specific gravity, and the effect of cold upon them, while they are the produce of the same plant, and procured by the same process. Dr. M. concluded by expressing his expectation of shortly being able to communicate to the public more important results from the analysis of the same plant, particularly as regards its bitter principle.—From the "*Birmingham Journal*," to which, we presume, Dr. M. communicated the account.—*Ed. L. G.*

Baron de Menil's safety-lamp was noticed in our last. It differs from Davy's, in having the chimney left open. Professor Graham suggested, that to absorb the carbonic acid gas, the cause of these calamitous explosions in coal-mines and other subterraneous works, an equal mixture of dry-slaked lime and Glauber's salt might be very effectually employed.

In Section C., after the discussion, which we reported at full length, Mr. J. E. Marshall read a paper 'On the Silurian Formation of Rocks, from Shap to Casterton Fell, in Westmoreland;' and Mr. Strickland put forward the following printed queries respecting the superficial gravel in the neighbourhood of Birmingham.—1. Does the gravel near Birmingham ever contain chalk flints, fragments of oolite, &c., which may indicate a southern origin, or is it wholly of northern extraction? 2. Does it ever contain marine shells? 3. Are these shells of existing or extinct species? 4. Does it ever contain bones of terrestrial mammals, or fresh-water shells? 5. What are the circumstances of position, material, &c., of

the gravel in which mammalian bones or fresh-water shells are found? and is it distinguishable in any respect from the gravel in which marine remains are found? 6. Are mammalian remains ever found in company with marine shells?

SECTION G.—Mechanical Science.

Mr. Scott Russell, 'On the most Economical Proportion of Power to Tonnage in Steam-vessels.'—The rule by which most proprietors of steam-vessels have been guided is the application of power in small proportion to tonnage; but where velocity was the chief object, higher proportional power has been employed, with a great expenditure of fuel, and not with the ratio of increase to the velocity; or high powers and large consumption of fuel have been attended with only a slight increase of velocity; and, therefore, the employment of low powers, with low velocities, would appear to be most economical. But this conclusion has not been borne out; and, by an examination of the books of expenditure of fuel, belonging to several companies, he had found that experience had proved the use of high steam powers and high velocities more economical than low ones. This had been attributed to Mr. Russell's wave principle, and he had, therefore, carefully investigated the subject. The result of which he had arrived, appeared to him quite new and very remarkable. The general principle was:—that in a voyage by a steam-vessel in the open sea, exposed, of course, to adverse winds, there is a certain high velocity and high portion of power which may be accomplished with less expenditure of fuel and of room than a lower speed with less power. This was proved arithmetically, and by a formula, in relation to the same vessel, with different powers of engine, whereby any other case may be determined.

Fair Weather.—1200 tons, 400 horse-power, 9 miles an hour, 216 miles a-day, 1 ton of coal an hour; 2160 miles 10 days, 840 tons of coal.

1200 tons, 500 horse-power, 10 miles an hour, 240 miles a-day, 1½ ton of coal an hour; 2160 miles in 9 days, 370 tons of coal.

Adverse Weather.—1200 tons, 400 horse-power, 5 miles an hour, 120 miles a-day, 1 ton of coal an hour; 2160 miles in 18 days, 436 tons of coal.

200 tons, 500 horse-power, 6½ miles an hour, 163 miles a-day, 1½ tons of coal an hour; 2160 miles in 13 and one-half days, 395 tons of coal.

General Formula.—Let v represent the velocity of a given steam-vessel in a fair weather voyage; v' , the same vessel in an adverse weather voyage; v'' , a vessel of higher power in the former; v''' , the same in the adverse one; p , the power of the former vessel; p' , latter vessel.

$$\sqrt{v''} - (\sqrt{v} - \sqrt{v'}) = \sqrt{v''} - \sqrt{v} + \sqrt{v'} = \sqrt{v''} - \sqrt{v} + \sqrt{v'} = \sqrt{v''} - \sqrt{v} + \sqrt{v'}$$

$$= \sqrt{v''} - \sqrt{v} + \sqrt{v'} \text{ in the case of equal ex-}$$

use, when the highest proportion of power it will be economical in fuel may be at once ascertained.

Dr. Lardner observed, that it was a new theory; but, from Mr. Russell's exposition, he was satisfied with its accuracy.

Mr. Russell stated, in answer to a question, that the principle was only true in reference to long voyages, because where vessels were not exposed to continued adverse weather, a great additional power would only be an additional expense.

We must still for the present reserve the statistics, which are long, for future notice.]

TUESDAY.

SECTION A.—Mathematics and Physics.

Mr. J. S. Russell, 'Report of the Committee on the Tide' (Himself and Sir J. Robison).

Professor Whewell's remarks 'On the Tides of the open Ocean,' by Lütke.

3. Professor Whewell's remarks 'On Captain Fitzroy's Views respecting Tides.'

4. Sir J. Herschel, 'Report of Application to Government for Increased Instrumental Power and Assistance at the Royal Observatory at the Cape of Good Hope.'

5. Sir J. Herschel, 'Report of Reduction of Meteorological Observations.'

6. Professor Forbes, 'On the Use of Mica for the Polarisation of Light.'

7. Mr. Goddard, 'On the Use of the Oxy-Hydrogen Microscope in Experiments on the Polarisation of Light.'

8. Mr. Addison's 'Meteorological Observations at Great Malvern.'

9. Colonel Sykes, 'On the Meteorology of the Ghats of Western India.'

1. Mr. Russell observed, that the committee had continued and almost concluded their inquiries. These had been directed, in the first place, to the determination of the nature and laws of the wave of translation, as distinct from the wave of oscillation. Extended researches have confirmed former experience. The form of the wave of translation is that to which the term hemicycloid has been affixed; and the wave obeys the laws as stated in former reports. The laws had been obtained from the equations of a place on the hypothesis that the movement of the atoms of water was not infinitely small as supposed; and highly satisfactory conclusions, in support of these views, had been derived from the labours of Professor Kelland. In the next place, the inquiry had been directed to the connexion between the motion of the wave and the resistance offered to floating bodies. Former views had been confirmed in a highly satisfactory manner. The experiments had been conducted on a more striking scale. The phenomenon of a vessel skimming the surface of the water, the resistance of the wave having been overcome by a high velocity, had been exhibited in an unusual degree. The prow divided the wave, which rose on each side, in a remarkable manner, to a height of three times the depth of the vessel, spreading out from it; the upper surface appearing as a thin film, and resembling wings to the moving body. The third inquiry was as to the form of a solid of least resistance in a practical form. Mr. Russell had inferred, from theoretical views, that a certain form which he termed the wave-form, would be the form of least resistance and least displacement. This inference had been confirmed last year by experiment,—by calculation and by practical advantages. The questionable proof of the two latter confirmations were adduced: a clergyman of Scotland, the Rev. Mr. Brodie, had been induced by the account of the proceedings of the British Association to investigate and to test mathematically the truth of Mr. Russell's inference, and he had by a totally different process arrived at the same conclusion. And Mr. Ashton Smith, of Wales, has built a steamer of 660 tons burden, and 220 horse power, in accordance with the new form; she is the fastest vessel in Britain, she realises fifteen miles an hour; and whilst other vessels at much less speed raise up the wave in white foam under their bows, the Fire King moves it aside and no single particle of white spray is perceived. Another proof of the permanent benefit likely to accrue to the naval interest is the fact, that many eminent ship-builders have at last entered upon the question which before they would never entertain; and at the present time there are four or five vessels of large size being built on the new wave principle. The last subject of the experiments was the application of this knowledge of waves to the terrestrial mechanism of the tidal wave. It was, in fact, a continuation of the inquiry of Professors Lubbock and Whewell, who had explored this wave until it ceased to be effected by celestial influence. The committee had come to the conclusion that the tidal

wave is a great wave of translation, but had not as yet carried out their experiments sufficiently to enable them to decide the mechanical properties of its propagation from shore to shore and up estuaries and rivers. To this end observations had been made in uniform channels, also in channels not uniform, especially in the Firth of Forth, where there were several stations established. The results, however, are not as yet complete; but a few phenomena had presented themselves, one of which was so striking that Mr. Russell could not refrain from describing it to the Section. In investigating the outline of the form of the wave, they found, to their astonishment, that in the Firth there were double tides—four instead of two—four high-waters and four low-waters a-day. And this phenomenon was observed, not at one point only, but at the series of stations. The wave, moreover, increased in magnitude as it ascended the river. This he considered it desirable to explain, and he thinks he sees the cause. The tidal wave which brings high-water to Great Britain, divides into two parts, the one goes up the English Channel and the other round the north of Ireland and Scotland, coming south to the Firth of Forth, but arriving later than the southern or English Channel wave already in the Firth. The larger northern one almost overtaking the smaller one at Stirling, where they are nearly coincident. In their passage up traces of two distinct waves have been observed, explaining, Mr. Russell thinks, the phenomenon of double tides; but he considers many accurate observations requisite to the proof. He believes the phenomenon to be very common, but not hitherto observed. Waves of translation never unite, they do not obey the laws of oscillation; they often coincide, but as often separate again, the larger and one of greater velocity, passing over the lesser, and on in its course. The lesser one, moreover, is not altered in form nor retarded in progress. Besides, waves of translation frequently cross each other at all angles, and retain their identity. The series of observations on this interesting subject will be complete next year.

Professor Forbes observed, with regard to the separation of the waves, that after two had blended into one, the ordinate of the joint wave would be the sum or difference of the ordinates of the waves, accordingly as the two waves coincided. Professor Whewell said, No; they will separate. Mr. Russell said they had often been found to do so. Professor Stevelly stated that, by the law of oscillation or the undulatory motion, the effect would be exactly as explained by Professor Forbes; but the motion of translation, from its very nature, as described by Mr. Russell at Newcastle, would cause the waves to separate. He attributed the difficulty Professor Forbes laboured under to his not having been present at the last meeting, when the minute account of the properties of the wave of translation was given.

2. This was a communication from Admiral Lütke, read by Professor Whewell. The admiral had traced the cotidal lines from North Cape, where those of Professor Whewell end, beyond Lapland to Nova Zembla; and had observed that to the eastward of Nova Zembla the tidal wave is scarcely perceptible. Professor Whewell remarked that the disappearance of the tide-wave in large tracts of sea, and the absence of tides in the centre of the Pacific, or of any wide waters, were at present anomalies. The Russian admiral further communicated that the diurnal inequality, supposed peculiar to one or two places, was well known to Russian navigators on the coast of Kamtschatka.

and of North America. It was, therefore, he conceived, a general law.

3. Captain Fitzroy conceives that the tides of the Pacific are not the result of a progressive wave, which is the basis of Professor Whewell's researches; but that they are produced by a vast oscillation, by which the sides of the water would be raised high, whilst the centre would be at rest. Professor Whewell did not deny the possibility of such an oscillation. By this view also, some of the phenomena inconsistent with the equilibrium theory might be explained. But whether this motion be consistent with the forces exerted by the sun and moon, is an extremely difficult problem of hydromanics. He could not adopt Captain Fitzroy's views, but they were a kind of relation by no means hastily to be rejected.

Professor Whewell then took leave to present the 'Report on Tidal Waves,' received from Mr. Bunt, to whom, and to himself, a grant for the research had been voted, at the same time observing that it was not of a nature to be made intelligible to a general audience. This is a sufficient reason for its not appearing in our columns.

4, 5. Several letters from Sir John Herschel stated the progress that had been made in consequence of the grants for the reduction of meteorological observations at the equinoxes and solstices, and for the appointment of an efficient observer, &c., at the Cape of Good Hope. [Mr. Mann has been appointed, and other necessary steps taken].

6. Professor Forbes read a paper 'On the Use of Mica in Polarising Light'; and, after stating his method of employing it, expressed his opinion that it might be made very important towards explaining the nature of metallic reflection. Professor Lloyd agreed that this process might throw light upon the internal structure of metallic substances, and in other respects considered it to be highly important. By polarising light, either elliptically or circularly, in a superior way to any hitherto practised, it might lead to a termination of some of the difficulties which beset the inquiry. As Professor Forbes had found, on exposing mica to heat, that exceedingly thin laminae were separated, the surfaces of which furnished these reflections, he supposed it likely that all metallic plates presented similar laminae, on which depended their polarising influence. Professor Powell confirmed these opinions, and adduced instances of such laminae polarising light, without affecting the image thrown upon the metal.

7. Mr. J. F. Goddard read a paper 'On the Oxy-Hydrogen Microscope, in exhibiting these Phenomena of Polarisation,' which consisted chiefly in the application of the means, and of results shewn in London exhibitions.

8. Mr. Addison read an excellent local paper (and well fitted to be considered with general comparative tables) 'On the Meteorology of Great Malvern for Four Years.' In answer to a leading question from Professor Powell, Mr. Addison gave an extraordinary relation of a flight of shooting stars, which he had seen below him from the top of the hill in Nov. 1832. These meteors resembled a shower of fire, and it was in a November fog. Professor Powell said, that on the 10th of this month he had witnessed a similar fall at Tunbridge Wells. They left trains of fire behind them, and their motion was from north to south. [The date curiously coincides with the American and other annual star fireworks.]

9. Some observations on barometrical and thermometrical variations, under such circumstances, were offered by Professor Stevelling,

Mr. F. Baily, and Mr. Jeffreys (who had experimented on the Himalah Mountains); and a paper by Col. Sykes (kept from the meeting by his canvass for an East-India Directorship, and we can hardly imagine a more worthy and accomplished candidate) was read, 'On the Meteorology of the Ghats,' and closed this sectional meeting.

SECTION B.—Chemistry and Mineralogy.

1. Mr. H. L. Pattinson, 'On Electrical Currents in Metallic Veins.'

2. Professor Hess, 'On Apparatus for conducting Organic Analysis.'

3. Professor Graham, 'On the Chemical Theory of the Voltaic Circle.'

Mr. H. L. Pattinson read a paper 'On Electrical Currents in Metallic Veins.' The writer undertook this investigation at the request of the Association last year at Newcastle; and, after detailing many experiments, he inclined to the non-current opinion, though it was possible, by the employment of more delicate tests, &c., that the contrary might be established.

Mr. Spencer opposed some experiments of his to those of Mr. Fox; and held, that the presence of two metals was not always necessary.

Dr. Golding Bird congratulated Mr. Pattinson on the accuracy of his experiments, and observed that as such currents were not detectable on the galvanometer, and susceptible of chemical action, his theory was very satisfactory.

A paper was read by Professor Hess, of Petersburg, 'On Professor Leibig's Apparatus for Analysing Organic Substances,' which was similar to that described in 'Puggendorf's Journal' a few months ago, with the exception of passing oxygen through the tubes instead of atmospheric air.

Professor Graham, 'On the Theory of the Voltaic Circle,' entered into an explanation of the views now general as to the propagation of electrical induction through the fluid and solid elements of the Voltaic circle, by no circulation of the electricities, but by their displacement in the polar molecule. In a molecule of hydrochloric acid, for instance, the electricities are displaced, the positive goes to the atom of chlorine, and the negative to that of the hydrogen, and each retains the chemical affinity of the chlorine and hydrogen respectively. Mr. Graham wished to refer the phenomena directly to the chemical affinities, and to omit entirely the idea of electricities being possessed by the molecules. In short, he observed the term electricity, or chemical affinity, must give way. He then took hydrochloric acid as the type of exciting fluids; he gave to each molecule a pole, the one with an affinity for chlorine, which he termed *chlorous* affinity, instead of negative electricity; and the other with an affinity like that of zinc or hydrogen, which he termed *zincous* affinity instead of positive electricity. Extensive diagrams illustrated his views; but the purport of his paper was to shew that an advantage would be gained by change of terms, and that the condition of the terminal affinities would convey more readily the states of the elementary bodies. The change in the nomenclature proposed was as follows:—

Synonymes.

Zincous	Positive.
Chlorous	Negative.
Zincoid	Positive pole.
	Anode, zincode.
Chloroid	Negative pole.
	Cathode, platinode.

The term zincoid, Prof. Graham observed, means what possesses the properties of zinc, quasi zinc; and chloroid, what possesses the pro-

perties of chlorine, quasi chlorine. Zinc was the head of its class; and of all salified bodies, chlorine was the head. They were types of their families. The same views were applicable to electrolytes, the elements of which he also wished to be called zincous and chlorous. Thus the concluded induction is an assumption, and we get rid of positive and negative electricity.

Mr. Grove objected to the terms zincous and chlorous, as too specific for the predicaments. They were not, moreover, the extremes of their class: for instance, in chloric acid, oxygen must, according to Prof. Graham's views, be stated to be chlorous to chlorine; and at the other extreme, potassium and the earthy radicals more zincous than zinc; but supposing the terms were chosen from the extremes, *non constat* but that substances of a greater extent of difference might be discovered, and thus a continual change of terms would be necessary. On the other hand, the terms positive and negative were essentially generic, and applicable to any change which could be at present foreseen.

SECTION C.—Geology.

1. Mr. Williams, 'On the Rocks of Devon and Cornwall.'

2. Mr. Austen, 'On the Fossils in the Limestone Slates of South Devon.'

Mr. Lyell's paper having, as we noted in our last, opened a new and interesting field for geological discussion, the Section Room was crowded as soon as the doors were opened; and, for several hours, many disappointed visitors were obliged to seek their instruction at other places, in consequence of finding this shut against all further entrance.

Dr. Buckland proceeded to make his promised statement. He remarked that the phenomena brought before them by Mr. Lyell were of very general occurrence. The pits in chalk, filled up in the manner he had so ably pointed out, had long been observed by French geologists, who had given them the appropriate name of natural wells—*puits naturels*. But to the present moment they had never been subjected to a systematic examination of the detritus they contained, their sand, gravel, and other deposits. They had only been noticed in a desultory manner. On reviewing what he had himself seen, and what had been advanced by Mr. Lyell, he differed from him as to the cause whence the acid vapours, or acid waters, were derived: what he might call the corrosive origin of these pipes or natural wells. His observations had been made upon those immense chalk-pits and excavations which occurred near Greenwich and Gravesend, where many acres were contained in a vast single field. With regard to the clay lining of the fissures, it might, like the work of bricklayers in chimneys, be called their *pargetting*. In his opinion, the gravel had been deposited at a period when the whole formation was under the salt water; and the clay, after the chalk had become dry land. The caves of Lunel, near Montpellier, in the south of France, offered analogous appearances. But the action of carbonic acid vapours, it should be held in mind, were not peculiar to chalk. In Auvergne, he had been taken to a well in the formation of granite, into which they threw cocks and hens to gratify the curiosity of visitors; and these animals were quickly destroyed in the same way as at the *Grotto del Cane*, near Naples. In Nassau, the same phenomena occurred; and it was upon the numerous acid springs in the vicinity of the Eifel that Baron Von Buch had founded his theory, that their impregnation and action were derived from the igneous rocks among which they rose. The Seidlitz and other acid waters, which came up from the earth spark-

ling like champagne, were thus accounted for by the Baron; who held that, though throwing off much of that with which they were charged, there still remained enough of acid to produce effects far more extensive than those under their consideration. A thousand square miles of rock of volcanic origin were percolated in this way. The phenomena of caves were also analogous, and were ultimately due to acid vapours or waters. They were lateral expansions, caused by the same action, after the chalk had been raised from the sea. In the caverns at Kirkdale, for example, the nodules of chert stuck out of the walls in thousands of projections, whilst the substance in which they had been embedded was corroded away. These nodules often had echini upon them, marking the age of these formations. Pursuing his subject, the learned professor then referred to some drawings which he had mentioned yesterday. They represented some extraordinary scenery near Syracuse, upon which he bestowed a high panegyric, and promised that they would well repay the trouble of a visit from any who now heard him, should it ever happen to them to be in that country. The extraordinary caves in this spot, not far from Hybla, so famed for its honey in classic lore, were the habitations of the native troglodytes long before the Greeks established themselves in Sicily. These were, no doubt, enlarged by their inhabitants, but there was one of considerable magnitude in the upper part of the cliff, hardly accessible to human foot, which had evidently been formed by the corrosion of an acid. Above Tours the same easily constructed abodes were found; and at Matlock, in our own country, these cheap and ready habitations were the residence of many of the poor. The rev. doctor further digressed to speak of the permanency of Trajan's Pillar, and of the famous Ear of Dionysius, and a ruined temple near these caves, which he ascribed to their being cut out of solid blocks of marble, without joints or cavities to expose them to the injuries of the atmosphere. Returning to his subject, he held that the corrosion in question had not been performed by running water, either from the surface or from below; but by water derived from currents under the sea. [This proposition was afterwards disputed, and no very satisfactory answer given.] The Doctor came next to treat of the action of rains on superficial rocks, of which he exhibited drawings by Mr. Thomas Webster, that most able artist and geologist.* Having made these cursory remarks, he would now address himself to the paper upon the Greenwich chalk he had spoken of; for he was sorry to inform them he had not come to that yet (*a laugh*). Here, where such prodigious masses of chalk and lime had been removed, similar perpendicular pipes were numerous; and there never was an instance of horizontal gravel. In a sand deposit cart-loads of bones were found, and horns of deer. The surface resembled that of the moon, so like that of volcanic countries, only in the former the holes were of prodigious extent. Some of them were fifty miles in diameter, and twice as deep as the adjacent elevations. Near Greenwich the hills were but as ant-hills, and the hollows between no larger than might admit a fellow of goodly rotundity to seat himself in one of them with his feet stuck up (*a laugh*). There, like Humpty-Dumpty, he might stretch each arm over the nearest hillocks, and feel the similar cavities on either side. Into these the deposit of carbonic acid from the

rains would produce effects such as Mr. Lyell had described, and agreeably to the explanation of Mr. De la Beche. In the county of Antrim chalk flints were found below the basalt, and were stained red by the contact with volcanic rock, and a thin red stratum occurred between the chalk and trap. Between High Wycombe and Beaconsfield, as he had mentioned yesterday, the holes were filled with the bones of turtle and many other animals common to the tertiary gravel, with which they were here intermingled. This gravel was not superficial, but, as he thought, of the epoch of the Hertfordshire pudding-stone and the formations of Blackheath. On the surface of the chalk they invariably found pebbles more or less rolled, as if the water had retired from them. The carbonic acid still continued to act: but, as we understood him, he was inclined to attribute the tubes in chalk to its action from above, whilst in volcanic regions, as in Auvergne, and during the tertiary period, he ascribed them to the intense action and great ascent of the carbonic acid which followed the plastic clay formation. For these reasons he could not agree to Mr. Lyell's hypothesis that the pipes in the Norfolk, or any chalk, were the result of the ascent of acid springs or vapours. He could not conceive where they were to begin; and he observed that the chalk immediately below these presumed vents was unchanged, and exactly like the surrounding material. This could not have been the case had the acid originated there. He would now be pachydermatous enough to venture his own theory; though he confessed their infinite obligation to Mr. Lyell for propounding his views on this subject. The lady of their respected secretary, Mr. Murchison, had in her collection a dish of curious fish, but they were not bigger than minnows; they were like the white bait so agreeable to eat at Greenwich, where his chalk pits were situated (*a laugh*). They did not reach the size of those Irish sprats which his friend (Mr. Williams) had obtained from the formations at Antrim. How, he would ask, came these fish to die? It was obvious from their remains that they had been killed instantly, some of them immediately after their own dinners, and been buried to the present age. On Mount Lebanon they were found, and on the Hartz Mountains. How came they to die? Some might have been destroyed by bitumen. When the island of Sabrina was recently thrown up from the sea, thousands and tens of thousands of fishes were cast on the shores, scalded to death,—killed either by heated water or by the disengaged carbonic acid. To ascertain this point, he had tried experiments with Dr. Daubeny; the fish were put into a vessel and the acid introduced. For a very short time they seemed not at all affected by it, but all in from one to five minutes perished: not one lived beyond five minutes. They darted round the tub with a rapid motion, and died. The fossil remains of fish in volcanic districts presented exactly similar phenomena: it was certain that they had died suddenly. Now the bottom of the sea would for centuries be impregnated with this acid, and it would exactly produce all these effects. There were, he acknowledged, some difficulties in the way of this explanation; and noticed, in illustration, the state of the strata between Weymouth and Flamborough Head. In conclusion, he again expressed how deeply they were indebted to Mr. Lyell for pursuing this inquiry connected with superficial geology, and an accurate examination of the surfaces of rocks. It was only within four or five years that it had been taken up, and

already they had made striking advances in eliciting from it information of great value. Dr. B. then illustrated this opinion by advertising to his favourite topic, the impressions left on the sands. These were registers of the phenomena. From them could be told where the rain fell, whether the footsteps were directed, if they were small rains or thunder storms, which way the wind blew, the animals walked, and the water ran. All this was unfolded by a small piece of Shrewsbury sandstone! From the fossil fishes they could acquire like knowledge—see what they had eaten for dinner, and how much digested: altogether, it was only by such means they could ascertain the progress of animal creation and the changes in the formation of the earth.

Mr. Lyell rose to communicate some new facts connected with the subject, which he had only that morning received from a young friend, Mr. Wickham, at Norwich. This gentleman stated, that at Mr. Lyell's request he had explored a chalk pit at Higham, where, instead of being quite or nearly perpendicular, as at Eton, he had found the gravelly pipes tortuous, slanting and winding (a drawing of a transverse section shewed this). Sometimes a covering of marl was deposited over their upper surface, which must have taken place after the gravel had sunk into the cavities. There were also cavities in the middle of the chalk, and without any communication with the surface. On the surface a chalk rubbish, of a posterior date, appeared. In one tube, two masses of indurated white sand were discovered. The Norwich crag at Thorpe, where so many varieties of fresh water and marine shells were collected, sixty per cent belonging to British living shells and forty per cent to extinct species, lay above the chalk. The upper stratum consisted of a ferruginous sand of a brown colour and containing organic remains. Below was a stratum of ten feet of sand, and between it and the crag was a thin lining of slate-coloured clay. Twenty feet of crag succeeded, and below was the chalk, excavated to the depth of thirty-five feet, and within four feet of the water. Mr. Lyell then defended his theory of the ascent of acid vapours from below, which he thought the most probable as regarded the larger pipes; but he was inclined to adopt Mr. De la Beche's opinion respecting the smaller ones, that they were formed by the descent of rain charged with carbonic acid from above.* As for the promise of their learned president, Dr. Buckland, he had given them no theory at all.

Dr. Buckland joined in the laugh at this, and said that the antiquaries' notions of Druids' stones were all mistaken, and stolen from these irregular surface wells of the geologists.

Mr. Strickland mentioned several gravel tubes near Henley, which had been made in the chalk within a very few years.

Here the discussion closed.

Mr. De la Beche exhibited an admirable specimen of the 'Ordnance Geological Map of Devon and Cornwall.'

1. Mr. D. Williams read a paper 'On the Rocks of these Counties,' in which he opposed the opinions of Mr. Weaver in the 'Philosophical Magazine.' From a map and section which he exhibited, shewing the position of strata in various parts, he concluded that all Cornwall and South Devon were of geological conformity, and probably the produce of long-continued volcanic activity. The immense granite dyke from Oakhampton to the Scilly Islands might

* These were certainly very characteristic and beautiful, and proved how well Mr. Webster was entitled to the compliment paid to him.—Ed. L. G.

* Two theories for the same phenomena, only differing in size, does not seem to us to be very philosophical.—Ed. L. G.

be of a volcanic origin, and of the same period as the parallel ranges of the Grampians and the north of Ireland. The entire structure of Exmoor he believed to have existed long before the depositions of the Cornish slate.

2. A paper was next read from Mr. Austen, 'On the Fossils in the Limestone Slates of South Devon,' shewing the great analogy between the remains of the Eifel on the Rhine and of Devon, regarded of the same age. A long list of them was read, and included Radiaria, Mollusca, and Crustacea. The south of Ireland and Lower Normandy possess similar strata. The paper offered some very sensible objections to the practice of giving local and personal names to objects of general science.

Mr. Greenough exhibited the new edition of his Map of England; and Mr. De la Beche complimented Mr. Williams on his industry in exploring Devonshire. He estimated the thickness of the slate series of North Devon at 30,000 feet, containing fossils slightly resembling the Silurian form. The fossils from the limestone of South Devon are all different from those of North Devon. He expressed his opinion that the limestones of South Devon are younger than the slates.

SECTION D.—Zoology and Botany.

1. Mr. Goodsir, 'On the Follicular Stage of Dentition in the Ruminants, and the Orders of Mammalia.'
2. Mr. Wilde, 'On the Preparation of Fish.'
3. Mr. Forbes and Mr. Goodsir, 'On the Ciliagrade in the British Seas.'
4. Mr. Wilde, 'On some New Entozoa.'
5. Mr. Webb Hall, 'On the Growth of Wheat.'

Mr. Goodsir read a paper 'On the Follicular Stage of Dentition in Ruminants, and other Orders of Mammalia.' Referring to his paper on the same subject, at Newcastle, he had since ascertained that all the permanent teeth, excepting the first molar, which does not succeed a milk tooth, are developed from the internal cavities, and the depending folds of the sacs of composite teeth are formed by the lips of the follicles advancing inwards after the latter closes. Mr. Goodsir further described the earliest indications of the teeth in the embryo state, and generally the gradual formation of teeth. In conclusion, he stated the results he had arrived at to be that, 1. In all the mammalia he had examined, the follicular stage of dentition was observed. 2. The pulps and sacs of all the permanent teeth of the cow and sheep, with the exception of the fourth molar, were formed from the minor surfaces of cavities of reserve. 3. The depending folds of the sacs of composite teeth were formed by the folding in of the edges of the follicle towards the base of the contained pulp, the granular body assisting in the formation of these folds. 4. The cow and sheep (and probably all the other ruminants) possessed the germs of canines and superior incisors, at an early period of their embryonic existence.

Mr. Wilde's paper 'On the Preparation of Fish' followed. His method of preserving specimens appeared to accomplish that object in the most natural manner. A conversation ensued, in which it was discussed, whether arsenical soap was eligible for this purpose? Mr. Strickland holding that it was not; and Mr. Burchell, the African traveller, stating that it had been perfectly so with him, and lasted for five and twenty years.

Mr. R. Patterson brought forward a specimen of Ciliagrade, taken on the Irish coast, and which he had named *Bolina Hibernica*. It led to a question on the luminosity of this species of fish. Professor Jones stated that the property was not limited to this species, as several possessed it; nor to life, as the dead also were

luminous. Mr. E. Forbes recommended the placing of the animals in a watch-glass, as the best mode for examining them. A subsequent paper, 'On the Ciliagrade in our Seas,' by Mr. Forbes and Mr. Goodsir (illustrated by drawings of Alcyonæ, Cydippe, and Beroë), led to a conversation respecting the fine tentacula, and other curiously formed organs of these Medusæ, hitherto so unsatisfactorily examined.*

It concluded with one part of the Section speaking of their eyes at the ends of certain filaments, and another portion denying that they had eyes at all.

Mr. Wilde read a paper 'On some New Entozoa.'

Mr. Webb Hall's paper 'On the Growth of Wheat' (see our last) closed the day's work.

SECTION E.—Medical Science.

- Mr. Middlemore, 'On Artificial Pupils.'
- Dr. R. D. Thomson, 'On Alkaline Dyspepsia' (given in our last Gazette).
- Dr. Macartney, F.R.S., 'On the Modes of Suppressing Hemorrhage.'
- Dr. Folville, 'On the Brain.'

SECTION F.—Statistics.

Mr. Hallam, P., in the chair, Sir C. Lemon, V.P., having presided on the preceding day. Report deferred.

SECTION G.—Mechanical Science.

Mr. Beart read a paper 'On a New Mode of Filtering Liquids by Means of a Perforated Piston.' By the usual mode of filtering, hydrostatic pressure had hitherto, with few exceptions, been used; but the tediousness of this process, especially as applied to decoctions, infusions of coffee, &c., and the waste from evaporation, loss of time, and heat, rendered some other mode desirable. The method he proposed obviated these inconveniences, namely, the use of a perforated packed piston, in a cylinder, or other shaped vessel, and making the piston itself the filtering medium.

Dr. Lardner, at great length, detailed some important 'Observations on the Resistance of Railway Trains,' containing the result of inquiries undertaken by himself and Mr. H. Earle, in conjunction with Mr. Wood, at the instance of the British Association. Before their inquiries were instituted, it was assumed by inquirers that the resistance of railway trains had no dependence on velocity. Their experiments were, therefore, directed to the solution of this question; and, after numerous trials on railways, they arrived at the conclusion that the atmosphere played a more important part in the question than was imagined, and that

* Eschscholtz's work on those of the Pacific Ocean is, perhaps, the best on the subject: the British species of ciliagrade ascertained, and some of them well known and not much liked in their jellies by our sea-bathers, are thus enumerated:—

- Genus *Cydippe*.—Filamentary appendages.
- Genus *Alcyonæ*.—Tentacula round mouth.
- Genus *Beroë*.—No tentacula or appendages.
1. *Cydippe pilosa* (Linnaeus).—Rows of cilia, 19 or 20, on the summits of the lobes—filamentary appendages white. St. Andrew's. Mouth of the Thames (Dr. Grant).
2. *Cydippe Flemingii* (Forbes).—(an; *Beroë ocellatus*, Fleming?)—Rows of cilia 36, on the summits of the lobes—filamentary appendages white. St. Andrew's.
3. *Cydippe lagana* (Forbes).—Rows of cilia about 25, placed in the furrows of the lobes—filaments white. Coast of Ireland.
4. *Cydippe poraformis* (Patterson).—Rows of cilia about 20—filaments rufous. Coast of Ireland and mouth of Forth.
5. *Alcyonæ rotunda* (Forbes and Goodsir).—Ovate, rounded, crystalline—tentacula rounded at their extremities—natory lobes forming half the animal. Kirkwall Bay, Orkney.
6. *Alcyonæ Smithii* (Forbes).—Elongate-pyriform, sub-compressed, crystalline—natory lobes not more than a third of the whole length—tentacula acute.
7. *Beroë cucumis* (Otho Fabricius).—No spots on external surface, internal dotted with red polata—clifforous ridges red. Isle of May at the mouth of Forth.
8. *Beroë fulgens* (Macartney).

its resistance produced a material effect on the velocity of the train. He stated that the whole of his details would be published, when those who felt an interest in the question might have an opportunity of examining the results they had arrived at for themselves. They had conducted their experiments on the Grand Junction, and Liverpool and Manchester Railways; and he took that opportunity of acknowledging his thanks, as he was sure the Association, as a body, would do, to the directors of those companies, for the facilities which they had afforded them in their inquiries.

The evening closed with a well-attended conversazione in the magnificent town-hall; where abundant refreshments were provided, and the splendid organ pealed forth its notes to the great delight of the company.

Following our own example last week, we now proceed to a miscellaneous insertion of Reports selected from succeeding days; and which, though irregular in the order of time, will materially decrease our labour as we overtake the Sectional proceedings.

Prof. Schönbein then read to the Section a paper 'On the Theory of the Electro-chemical Protection of Metals from Corrosion.' After glancing at the theories of electro-chemistry proposed by Berzelius and Sir H. Davy, the Professor adduced a numerous series of experiments, bearing upon the fact of the apparent necessary existence of a current to prevent the corrosion of the lesser oxydizable metal; for when pieces of copper and zinc were placed in metallic connexion, and immersed in vessels of brine not communicating with each other, the copper was invariably more or less attacked, unless a portion of both metals was immersed in each vessel: when, however, the copper and zinc legs of a compound arc were immersed in communicating vessels, the zinc was attacked and the copper perfectly protected from corrosion. This, and other facts bearing upon it, being proved, the Professor passed on to a consideration of the possibility of any development of polar properties influencing the behaviour of metals towards corroding liquids: this idea he experimentally proved to be untenable, as he had in vain sought for any case in which the chemical affinities of bodies were materially affected by their elastic conditions. Referring particularly to the immediate object of his paper, Professor Schönbein stated that he did not believe the protection of copper from the action of sea-water, by means of zinc or iron, depended upon the existence of a continuous current of feeble intensity, continually circulating through the metals, but rather on the induction of a kind of passive state in the copper, in the following manner:—A piece of copper being placed in metallic communication with a piece of zinc, and immersed in sea-water, slowly develops a current, which, although of feeble intensity, is, nevertheless, of sufficient electrolytic effect to decompose a portion of water, resolving it into its constituent elements; the oxygen combines with the zinc; the hydrogen being evolved, and becoming diffused over the surface of the copper, to which it adheres, this gaseous layer affords a mechanical protection from the corroding influence of the sea-water. The Professor drew some analogy between this state and the extraordinary passive state of iron, under certain conditions, towards nitric acid, previously described by him. In this case, Professor Schönbein thought it not improbable that peroxide of hydrogen became developed, and formed the protecting agent to the iron wire. After alluding

to some other points of great importance, as connected with the generally received views of philosophers on the electro-chemical relations of many substances, the Professor concluded his paper amidst considerable applause.

Mr. Grove said, that of the various theories of electricity, Professor Schönbein had only alluded to that of Sir H. Davy, as modified by Berzelius; and that he was unable to discover in what essential particular his (Professor Schönbein's) views differed from those of purely chemical theorists. With regard to metallic protection, Mr. Grove stated that his view had always been (and he never considered it as in the least degree original), that this protection was occasioned by the oxygen being abstracted by the affinity for it of the positive metal, and leaving hydrogen, or some electro-positive element, in contact with the negative metal. That this is the general view entertained by chemical theorists, he firmly believed; and that it is the view of Professor Daniell, he proved by a quotation from one of his papers. In speaking expressly of metallic protection, Professor Daniell says, "I was at a loss to conceive how the hydrogen, which must be the equivalent of the oxygen united with the positive metal, could be spread over so disproportionate a space." These words are too explicit to admit of any misconception. With regard to the possibility of feeble currents being conducted by electrolytes without decomposition, Dr. Faraday felt himself obliged to admit it; as the results of experiment shewed him, that evidence of decomposition could be obtained in no certain cases where there was evidence of conduction. He seems, however, to consider it rather as an exception to his law of definite electrolysis; and he by no means extends it to the generating pair, as he regards, or did regard, the oxidation of the zinc to be the sole source of voltaic action. The anomaly has, however, been removed by the detection of the phenomena of polarized electrodes, and by the satisfactory explanation of M. Becquerel.

After some remarks from other members present,

Dr. Golding Bird expressed his entire belief in the views of Professor Schönbein, and adverted particularly to that part which had been alluded to as most objectionable, viz. the possibility of minute traces of gases adhering to metallic surfaces, and thus mechanically protecting them from corrosion. Dr. B. stated that philosophers were in possession of so many facts supporting this view, that its correctness could scarcely be doubted; thus the secondary currents, developed by platinum plates that had been used on the electrodes of a voltaic battery, owed their influence entirely to the adhesion of infinitesimally minute portions of foreign matter to their surface; and this foreign matter, in the case of pure water, could scarcely be anything else than the gaseous elements of water. So far were the relations of a metal affected by this adhesion of gaseous matter to its surface, that it had been shewn that a plate of platinum, immersed in oxygen gas for a few seconds, was capable of developing an energetic current when immersed in acidulated water with a platinum plate that had not been so exposed. Dr. Bird referred to some researches, published by himself in the 'Philosophical Magazine,' in which this state of surface even modified the effects of platinum plates, when subsequently employed as the negative elements of a simple voltaic circle; so that when two plates that had been previously employed as the electrodes of a battery were voltaically connected with zinc, and immersed in the same vessel of

dilute acid, double the quantity of hydrogen would be evolved from one of the platinum plates, as compared to that evolved from the other. Collating these phenomena with those described by Dr. Faraday, in which the influence of platinum in aiding gaseous combination was affected by the state of the surface of the metal, Dr. Bird considered that an induction might be drawn highly favourable to the views of Professor Schönbein.

Mr. Grove explained, that he had not expressed any difference of opinion from Professor Schönbein, but had endeavoured to shew that the same views had been entertained by other electricians.

'On the Elastic Force and Density of Steam.' By Andrew Ure, M.D., F.R.S.—The specific gravity of vapours, of different substances, is a subject of modern investigation, for which we are primarily indebted to M. Gay Lussac. The experimental process devised by this ingenious and accurate philosopher, consists in measuring the volume of vapour, furnished by a given weight of liquid. Having weighed a globe of glass, like the bulb of a large thermometer, he then filled it, by heating the bulb, and plunging the point of its capillary tube in the liquid to be vaporised, repeating the heating and immersion till it was entirely full. In this state it was slightly heated, to expel a drop of liquid from the point, which was then hermetically sealed by the flame of a blow-pipe. The bulb was next introduced into a graduated bell-jar, about a foot long, and two inches in diameter, filled with, and inverted in, mercury, contained in a cast-iron trough. That jar was enclosed within a glass cylinder, open at top and bottom, the space between the two being filled with water or oil, whose hydrostatic pressure was supported by the subjacent column of mercury. The trough or pan, with these cylinders, was placed over a little furnace, whereby it was progressively raised to any desired degree of temperature. Eventually the liquid became sufficiently hot to generate vapour, of such tension as to burst the thin glass bulb. In the case of water, he continued to heat the apparatus till the water contained between the two cylinders entered into steady ebullition; at which instant he measured the space occupied by the steam, noting the height of the mercury in the bell above the level of the bath; by deducting which height from that of the barometer placed in the same apartment, he found the pressure of the internal vapour. He afterwards reduced by calculation the length of the volume of mercury, to what it would be at the temperature of melting ice; and made the small correction due to the volume of liquid between the cylinders.

In this research we must take care that the whole of the liquid of the bulb be reduced into vapour, otherwise we shall fall into great errors. This circumstance would occur, were more liquid introduced into the bulb, than would fill the whole space in the bell-jar at the given temperature.

M. Gay Lussac, in calculating the results, referred the volume of a gramme of water (15.444 grains) to a gramme of dry air, at 0.76^m pressure (29.92196 inches English), now since 1 litre (=100 grammes of atmospherical air) weighs 1.293 grammes, the volume of 1 gramme ought to be $\frac{1 \text{ litre}}{1.293}$. Let V be the volume of vapour furnished by a weight, 10, of the given liquid, the volume of 1 gramme will be $\frac{V}{10}$; let h be the height of the column of

mercury standing within the bell above the level in the bath; H, the height of the barometer at the time of the experiment; H h will be the pressure sustained by the vapour, it being the temperature of the whole apparatus. To make the comparison of volumes upon a like quantity of matter, they should be reduced by calculation to the same temperature and pressure. The weight of a litre of dry air being taken at 0° (C 32° Fahrenheit), and at the pressure 0^m.76, all the result should be reduced to the same point. At first the volume is too small, because each division, in virtue of its expansion, is enlarged in the ratio of 1 to 1 x kt; k being the cubic of the matter of the bell-jar. The volume of the vapour is dilated in the ratio of 1 to 1 x 0.100375 x t, as the volumes of gases and vapours are inversely as the pressures upon them, the corrected volume will be $V (1 \times kt) (H h)$

$$P (1 + 0.00375 \times t) 0.76).$$

The following calculation of the density of steam will illustrate the preceding proposition and formula:—

Weight of the glass bulb full of water 1.391 grammes.
Weight of the glass bulb empty 0.731 ..
Weight of the water alone 0.660 ..

This quantity of water filled at the temperature of 100 C, 220 divisions of the bell-jar; each division contained 0.005 of a litre. The column of mercury raised in the jar above its level in the bath was 0.052 of a metre; the internal barometers stood at 0.766 metre. The coefficient of the cubic dilatation of the glass is for each degree centigrade = $\frac{1}{273}$. Introducing all these data into the formula, it was found that the density of the steam is $\frac{1}{18}$ of that of air, or 0.625, air being 1.000. In the same way, M. Gay Lussac determined the densities of the vapours of ether, alcohol, sulphuret of carbon, and oil of turpentine, as follows:—

Tables of Densities.

	Weight of a litre at 0° C. and 0.76 of pressure.
Air	1.000
Vapour of water	0.625
Alcohol	1.613
Sulphuric ether	3.586
Sulphuret of carbon	3.645
Oil of turpentine	0.513

That the densities of vapours vary proportionally with the pressures has also been experimentally determined; or, in other words, vapours when reduced by calculation to the same standard temperature, are proportional to the elastic forces. Upon this principle, the column entitled specific gravity of steam, in the following table, has been constructed; and the column entitled number of cubic feet of steam, from one pound of water, has been computed by me from the preceding column, and the known weight of a cubic foot of water. One volume of water at 32° produces 1694 volumes of steam, at the temperature of 212° Fahr., and a pressure of 29.912 inches of mercury. The number 0.000589, given as the specific gravity of such steam, is obtained by dividing 1000 by 1698, on the supposition that one volume of water produces 1698 volumes of ordinary steam.

SECTION B.—Chemistry and Mineralogy.

'Upon the true Constitution of Chlorochlorine Acid; upon a new Compound called Iodosulphuric Acid; and on the Chromates of the Magnesian Family,' by Lyon Playfair, Esq.—The subject of this paper was to describe a new acid, and to point out methods of procuring others of a similar class, in the investigation of which Mr. Playfair is at present engaged. The compound which he has called Iodosulphuric Acid, may be procured by mixing two atomic proportions of iodine with one equivalent of sulphuric acid, and subjecting the

mixture to distillation; or by a more easy method, by sending a stream of pure sulphurous acid through a solution of iodine in pyroxillio spirit to complete saturation. It may be procured from this by distillation, drying over sulphuric acid, &c. It has a powerful acid taste, and acts violently on the cuticle, being analogous in composition with the chlorosulphuric acid of Regnault. Mr. Playfair tried several experiments to isolate hyposulphurous acid in a similar manner; but although not completely successful, he procured sufficient indications to encourage him to proceed. He then gave an account of the characteristic properties of the chromates of the magnesian oxides. The circumstances which induced him to enter into the investigation, was to discover the causes of the great dissimilarity, both in chemical and physical characters, of the chromates to their corresponding sulphates. Most of the magnesian chromates are described as insoluble, and those which are not are extremely little known; but by boiling a sulphate of the oxide required with chromate of barytes, soluble chromates may be obtained, exactly corresponding and isomorphous with the sulphates. They in general affect the same number of atoms of water. The insoluble chromates are of a very interesting constitution, but their analytical development is a work of extreme intricacy, on account of several existing of each oxide.

The Union Dinner, in the Town-hall, on Thursday, was a brilliant affair; the Marquess of Northampton presiding, and being indeed, as he was at Bristol (when, also, unexpectedly called upon to perform the arduous duties of president, in the absence of Lord Lansdowne, as now through the indisposition of Mr. V. Harcourt), the soul of the Meeting, both in its working business, and its relaxations from toil. At present, we have not room for a detailed notice. Above eight hundred members enjoyed the treat.

On Friday the excursions were sadly marred, by its being even as wet a day as that which damped the tournament at Eglinton. In spite, however, of wind and weather, we embarked with the Division A. (see *Lit. Gaz.*, Note, p. 547)—about eighty in number—and arrived in undue time, through slush and mud, at Horsely Iron Works, where the smelting of that stubborn ore is carried on in an admirable manner. Thence to the works of Messrs. Bradley and Co., through a drenching rain, which was compensated by the sight of the metal brought from the smelting furnaces, and now rolled about in burning masses with the ductility of dough or confection sugar. The fiery lumps hurled towards the grooved cylinders were soon formed in bars or sheets, clipped off like threads of flax, and moulded into any wished-for shape; while the longer rods and wires wreathed about as if they were living serpents of fire. It was a striking spectacle. Dried in these Volcanic regions, we were again wet to the skin in our walk to join Division C. at the Limestone Caverns [what became of Division B., if there were such, we never heard], and fortunately reached them in time to enjoy a scene which imagination could hardly conceive. These immense caverns were illuminated from end to end; and the lights reflected from the waters below seemed innumerable as the starry hosts. In lateral and highly arched caves, blue lights were burnt; and the whole was truly a magic illusion. The sides were lined with people, and in boats below were the members (some 300), headed by Mr. Murchison, who delivered a most ani-

ated and scientific lecture on the natural wonders by which they were surrounded. Volleys of arms were discharged with startling effect, and the shouts of the multitude gave an almost superhuman sublimity to the scene, as the clouds from the artillery rolled with their thunders along the vaulted roofs.

At the mouth of the caverns, Dr. Buckland pronounced a splendid oration, which we regret we did not hear, the sudden departure of Prof. Phillips, called away to attend the death-bed of his uncle, Dr. Smith, having left the divisions without programmes, so necessary for their direction. The incessant rain did not prevent nearly the whole party from attending Mr. Murchison to the Wren's Nest, on which picturesque spot, during a blink of fine weather, he explained the surrounding geological formations—the lime and coal, sources of the wealth of these districts, and themselves so rich in fossil remains. The lunch at Dudley was a merry meeting after all the physical endurance and mental enjoyments of the day; but as one of our companions, who unites much of wit and humour with no small share of scientific attainments, favoured us with a description of the whole in rhyme, we gladly avail ourselves of his sportive muse to lighten the solidity of these Reports.

The Dudley Expedition; an Association Melody.

Tune—"Going to Putney by Water."

Come, listen, all as members be,
Whether of Section A, B, C,
D, or else of F, E, G,
As go to Dudley by water!
As how from Brummingen we set,
Upon one Friday very wet,
To gather stones, and fossils get,
All at Dudley by water!
Skipping, dripping all the way,
Lots of swim and nothing to say,
Every one with summit to say,
Going to Dudley by water!

Each philosopher so wise
Then set out with staring eyes,
The little fishes to surprise,
As go to Dudley by water!
Not a soul behind did lag,
But with hammer and with bag,
Smashed at dyke, allp, fault, and crag,
When they went to Dudley by water!
Skipping, &c.

Under ground we then did go,
Candles round us in a row,
Such a flare-up and a show,
All at Dudley by water!
Dr. Buckland then arose,
And the people there he shows
What rum beasts in stone there grows
In the caves at Dudley water!
Dripping, &c.

Then at dinner sich a rush,
Such a scramble, cram, and crush,
Lots of grub and little lush,
All at Dudley by water!
And when we came back to town,
War'n't it funny that we found
All this fun for half-a-crown,
When we went to Dudley by water!
Skipping, &c.*

Postscript.—On Saturday the General Committee met (to the number of about thirty), at one o'clock; the Marquess of Northampton in the chair. The report of Thursday's meeting was read, and confirmed.—Mr. John Taylor laid the following state of the finances before them, made up to the 15th of August, and before the Birmingham meeting:—

Rec	
Balance in hand	£670 0 7
Compositions from Life Members	641 0 0
Subscriptions for 1838	1944 0 0
Do. 1839	37 0 0
	£3292 0 7

* A laughable incident attended this aquatic expedition. On passing one of the canal locks, boats have to leave a manifest so that the proper dues may be charged on them. One of ours, as returned by the surveying officer, ran thus—"Draught, 13 inches; weight, 3½ tons; cargo, philosophers!"

Brought over, £3292 0 7

"Transactions" sold	75

Total 1582

The disbursements, of course, not yet ascertained; and the voluntary contributions to what is called the Local Fund, apparently small in amount.

Dr. Peacock (the Dean of Ely) read the Report of the Committee appointed at Newcastle, to apply to government on the subject of the Antarctic Expedition, to be intrusted to that gallant sailor and eminent man of science, Captain James Ross. It detailed the negotiations and preliminary arrangements; touched on the importance of the magnetic observatories about to be established in connexion with it at St. Helena, the Cape, Canada, Van Dieman's Land, and New Zealand; and complimented ministers, and especially Lord Minto, at the head of the Admiralty, for having adopted the whole plan recommended in the most ample and liberal manner. The Erebus and Terror were now, or would speedily be, on their way to commence this the most important scientific expedition, perhaps, ever undertaken in the world. It was almost certain that other nations would follow the example, and, by establishing similar observatories, enable them to compare the phenomena over the face of the earth. The East India Directors had also come generously forward, and given orders for the erection of an observatory at Madras (held to be a preferable station to Ceylon, as originally in-

tended); and would extend them, where requisite, over the Indian territories. Dr. Peacock also spoke highly of the perfection of the meteorological and other instruments furnished, in duplicate, for the occasion; and observed that, though the grant of 400*l.* was continued by the Association as a contingent to the expenses, it was most unlikely that any part of it would ever be called. Only it was desirable to have it ready for any immediate demand, without waiting for the delay of official forms.

The next report was respecting a Museum for the Deposit of Mining Records, a very essential and useful recommendation. To this the Chancellor of the Exchequer had agreed, and government had consented to allow a salary to a keeper. Arrangements were making to carry into effect.

The Committee on publishing the Ordnance Map on a large scale—six inches to a mile—also gave in their report, from which it appeared to be in favourable odour, but not yet completely determined upon.

Dr. Lardner moved a vote of thanks to the railway directors, who had liberally aided the experiments on the resistance in railways, &c.—Carried.

Dr. Peacock then moved the new grants; but it will be seen that many of them were only renewals of former grants not taken up, or continuations of fractional portions where the whole sums had not been expended. The total amounts were, for

Section A	£1810 17 4
B	240 0 0
C	81 17 3
D	141 0 0
E	135 0 0
F	100 0 0
G	390 0 0
	£2888 14 7

The particulars are as follows:—

A. For Reduction of Meteorological Observations (Sir J. Herschel) continued	£100 0 0
For Reduction of Stars, Cælum Australe, Balance of 200 <i>l.</i> undrawn	189 0 0
For Revision of Nomenclature of Stars, Northern Constellations, continued	50 0 0
For Histoire Céleste, balance of 500 <i>l.</i> undrawn (13000 Stars had been reduced).	332 1 6
For Extension of Royal Astronomical Society's Catalogue, balance of 500 <i>l.</i>	343 3 4
For Magnetic and Meteor Instruments above referred to	400 0 0
For Hourly Meteorological Observations in Scotland, balance of 100 <i>l.</i>	50 12 6
For Committee on Waves	30 0 0
For Committee on Subterranean Temperature, to complete this branch of inquiry	30 0 0
For Tide Observations (Prof. Whewell)	30 0 0
For an Engraved Plate to facilitate Calculations in Observations	10 0 0
For the Translation of Foreign Scientific Memoirs (Major Sabine)*	100 0 0
For Anemometer (Prof. Whewell and Mr. Snow Harris)	10 0 0
For Mr. Oler's Anemometer	30 0 0
For Continuation of Hourly Observations at Plymouth	40 0 0
For procuring and fixing an Anemometer in Scotland	40 0 0
	£1810 17 4
B. For Analysis of Atmospheric Air (Mr. West) continued	24 0 0
For the Action of Sea-water on Cast and Wrought Iron (Mallet)	30 0 0
For Action of Boiling Water on Organic and Inorganic Bodies	70 0 0
For Experiments on the Gravity of Gases	40 0 0
For Experiments on Chemical and Electrical Phenomena, to follow on those of M. Schönbein, and reported at next Meeting	40 0 0
	£204 0 0

* This grant was recommended by Sections C and D, and it was particularly noticed how much the translation from the German of Gauss and Weber's works on magnetic association, the general theory of terrestrial magnetism, and on the uses of certain instruments, had contributed to the efficient preparations for our antarctic expedition (for them, see Parts V. and VI. of *Mém. R. et J. Taylor's Scientific Memoirs*, a periodical of infinite value in science). We could have wished this grant and its consequent operations extended to three or five times as much.—*Ed. L. G.*

C. Only one grant—for Promoting the Knowledge of Fossil British Reptiles, balance of 200 <i>l.</i> at Newcastle	£81 17 3
D. Experiments for the Preservation of Animal and Vegetable Substances (Prof. Henslow) continued	6 0 0
(By C and D) Drawings of Animals in Marine Zoology dredged up from the Waters	50 0 0
For engraving Skeleton Maps	60 0 0
For engraving Plants and Animals	20 0 0
For printing Questions for the Use of Travellers, respecting the Races of Men in uncivilised States (Dr. Pritchard)	5 0 0
	£141 0 0
E. For Experiments on the Sounds of the Heart	25 0 0
For Experiments on the Physiology of the Lungs and Bronchi	25 0 0
For Experiments on Important Medico-acoustic Instruments (Dr. Yelloly)	25 0 0
For Experiments on Vases and Absorbents	25 0 0
For Experiments on the Action of Acid Poisons	25 0 0
	£125 0 0
F. For Inquiries on Schools for the Working Classes	100 0 0
G. For Inquiry into the Duty performed by American Steam-boats	50 0 0
For Duty of Engines not in Cornwall	30 0 0
For Experiments on Hot and Cold Blasts	100 0 0
For Experiments on the Deflection of Beams after long use	20 0 0
For Experiments on the Forms of Vessels, continued	200 0 0
	£300 0 0

Other subjects were recommended without grants. In A. Mr. Henwood to continue his valuable Researches and Report on the Temperature of Mines in Cornwall. Mr. R. W. Fox, on Subterranean Temperature. The Committee at Plymouth, to reduce their Hourly Observations for the five preceding years. Professor Millar, Report on the State of Science,—on Radiant Heat,—on Electro-chemical and Magnetic Sounds,—on the Levels of Sea and Land.

That a Conchological Collection be formed at the British Museum, with models and casts.

The Committee for collecting and preserving Records of Mining Operations, to carry the plan into effect. And,

The Council to be authorised to apply for Reports of Scientific Progress in every Department of Science.

This last resolution is calculated to produce very important fruits; and we may here give the names of the council to whom the charge is intrusted: viz. Dr. Arnott; F. Baily, Esq.; R. Brown, Esq.; Earl of Burlington; Dr. Daubeny; G. B. Greenough, Esq.; Professor G. Graham; J. E. Gray, Esq.; R. Hutton, Esq.; Sir C. Lemon; C. Lyell, Esq.; J. R. Lubbock, Esq.; Dr. Lardner; Professor Owen; Colonel Sykes; Professor Whewell; Professor Wheatstone; Captain Washington; Dr. R. Lee; Professor Powell; Professor Mosely; Professor Daniel; G. Rennie, Esq.; Dr. Hodgkin; Dr. Peacock.

With this administrative body to direct the business of the Association, we were somewhat in error last week in saying that the Committee of Recommendation were "the Executive." Their office is certainly important as regards the finances, as no grants can be moved except through them; but still the General Committee possesses the power of *veto*, should it ever be necessary to exercise it.

At three o'clock, the general closing meeting took place in the Town-hall; of which, however, all we can at present notice is, that a scientific meeting at Pisa, in the first week of October,—a geological meeting at Boulogne on Monday next, September 7th,—and a meeting of German naturalists at Piedmont, on the 18th of September, were announced, with cordial invitations to the English savans to visit them.

The customary votes of thanks to the townspeople, institutions, &c., were given by acclamation; but our bounds are far exceeded, and we must reserve any particulars for hereafter. We may add that the summary of papers read at the various Sections during the week, hitherto, and justly, deemed one of the most important features of the meeting, was, for the first time, omitted at the conclusion of the sittings. But time pressed, and this very useful act, as well as the returning of thanks by the parties complimented, were left out.

REVIEW OF NEW BOOKS.

Journal of a Residence in England, and of a Journey from and to Syria, of their Royal Highnesses Reza Koolée Meerza, Najaf Koolée Meerza, and Taymoor Meerza, of Persia. To which are prefixed some Particulars respecting Modern Persia and the Death of the late Shah. Originally Written in Persian, by H. R. H. Najaf Koolée Meerza, &c.; and Translated by Asaad V. Kayat. 2 vols. post 8vo. London, 1839.

"PRINTED for private circulation only." We feel assured that our review of this very curious and entertaining work will lead to a very general demand for it, and that if not placed in the hands of a publisher, it will at least be allowed to issue in sufficient numbers to meet the wish of a very large circle of readers from the stores of its interesting translator.*

From Mr. Baillie Fraser's narrative of his visit and journey homeward, readers are in possession of the particulars which marked this extraordinary appearance on our political and fashionable scene of the grandsons of the late Shah of Persia; and so near the throne of that country by position as well as by descent, as to be objects of extreme jealousy to their cousin, the present ruler of the empire. Whilst others, less likely to shake the succession, were blinded and imprisoned, and their own father, Firmán Firmán, was carried from his government of Fars to die at Teheran; they effected an almost miraculous escape, and threw themselves on the good feelings of England for representation and intervention on their behalf. But we will not enter upon the considerations connected with their family hopes and fears; the spirit of their journal, and that which will afford so much amusement to the English people, is to hear from their own lips the account of their reception amongst us, the impressions made on them

* To put our friends and readers in the way to procure so singular and amusing production, we take upon ourselves to mention, that the residence of Asaad V. Kayat is at 98 Sloane Street; which we should expect to see very speedily converted into a busy book-selling shop. We have designated this gentleman as "interesting," and it will be confessed to be a well-deserved epithet, when we sketch the outline of his life and prospects. He was the interpreter to the Persian princes during their visit to this country; and is a person of very high talents. A native Christian of Beyroote, in Syria, and yet only twenty-six years of age, his abilities attracted the notice of Mr. Farren, the English consul-general at Damascus, who employed him in a semi-official situation, where he gained his entire approbation and esteem. He speaks and writes Arabic, Turkish, Persian, and English (like a native); is a good French scholar, and possessed of much general information. Mr. Farren sent him over from Bagdad with the princes, and he accompanied them back. He is now studying at our Universities, with the intention of returning to Syria, and form Normal Schools for the education of the natives, in conjunction with many individuals who are as zealous for the advancement of instruction, as religion, among the Syrian people,—the first being, indeed, the true source of the last. Asaad, we are informed, means especially to address himself to the improvement of the Christian women, who enjoy the privilege of communication with the harems of the Mahomedans. His plans are excellent, and his objects such as every friend to humanity and religion must earnestly desire should succeed to their fullest extent.—*Ed. L. G.*

by our strange manners and customs, their views of our various institutions and places of resort, their laughable mistakes, and their glorious Persian hyperbole. Yet let us not ridicule their errors too much! Perhaps an English traveller in Persia may fall into as many when he paints their condition, so entirely different in every respect from ours. At any rate, we shall proceed to give a pretty full taste of these *genuine*, droll, and whimsical pictures; in our opinion, far superior to the best *invented* productions which, under the *ruse* of being written by foreigners, have come from the pens of some of our ablest and best-informed authors,—from the old “Persian Letters,” to Southey’s “Donabado” and Morier’s “Hajji Baba.”

“It is rarely (justly observes the Translator in his preface) that the English public obtain such an opportunity of learning what is said of them by the people of other nations, as in the work now presented. It is not uncommon to have European travellers in this country; but to have Asiatic travellers, men of distinction, who write their views on all they have observed, is a singular phenomenon. Such a work may teach, by comparison, the state of civilisation to which Britain has attained; the difference between those customs which belong to its own habits and prejudices, and those which are the result of experience, convenience, and propriety. Here may be noticed the effect of manners, customs, &c., upon the minds of Asiatics; and from this may be ascertained how this country may best exercise a moral and transforming influence upon them. And we may learn further, what a vast interest might accrue to the English nation, and what great benefits may be conferred upon the East, by visits like this, of three Mohammedan princes of royal blood, or other personages of distinction.”

We are then told that “Najaf Koollee Meerza (Wali), being a person of intellectual character, a poet, and a man of observation, was the prince who wrote this journal. As to the matter which composes the work, it will be seen that it consists of three parts; viz. an account of the accession of Mohammed Shah to the throne; a journal of their voyage to, and residence in, England; and their tour overland to Constantinople and Bagdad.”

Such is an outline of the work, and with regard to its first division we shall merely quote two passages, because they are intimately connected with the fortunes of our princely visitors:—

“It has been the custom of all the princes of Persia to nominate their eldest sons as their successors to their principalities, which were almost independent. The principality of Azerbaijan, governed by Abbas Meerza, and that of Fars, ruled by Firmán Firmán, were very powerful. In their provinces they acted as sovereigns, held levees, had crowns on their heads; and that the father of these princes, Firmán Firmán, at Shiraz especially, held a magnificent court, and army, &c., with full control over the Persian Gulf for forty years, and fully expected to ascend the throne after the death of his father, may be seen from the modern history of Persia in this work. He was a prince of a great influence in Persia, as well as the brother, Shojáh el Sultané, who possessed the province of Kirmán, and was generally considered the most courageous and enterprising prince in the empire. The first of these princes is Reza Koollee Meerza, a man of superior talent and wisdom, who was the viceroy of his father; the second, Najaf Koollee

Meerza, and the third, Taymoor Meerza, were governors of some districts in the principality. Najaf Koollee Meerza is a well-known Persian and Arabic scholar, an excellent poet, and consulted as an oracle on many subjects, being exceedingly fond of literature.

“These princes were the first members of the Persian royal family that ever visited England. They were induced to take the journey by order of their father Firmán Firmán, who was taken to Teheran; and who sent to tell them that, although he was persuaded that they were ready to use all their endeavours to relieve him by civil wars, yet such proceedings were entirely against the welfare of the empire; especially as he himself was in the hands of Mohammed Shah, who might on this account treat him in a different manner; for Mohammed Shah had imprisoned almost all his uncles, and put out the eyes of some of them, and some of his own brothers were treated in the same manner. But although Firmán Firmán went to war against him and fell ultimately into his hands, and was brought to Teheran, yet he was respectfully treated in the capital, and no insult whatever was offered to him. Firmán Firmán, therefore, in his letters to his sons, persuaded them not to go to war, but to try to find their way to England, and to solicit his Britannic majesty’s friendly mediation with Mohammed Shah on his behalf, from which he anticipated a good result by the manner in which he was treated by the Shah. The princes accordingly were encouraged to take the journey, and had full hope that such mediation would immediately be granted. In fact, they could do nothing else, as they had only their lives left.”

So much for history, and we now come to that portion of the work which will afford the greatest pleasure and diversion to our readers. The ludicrous effect of our every-day and common doings upon the minds of men unaccustomed to any thing in the least resembling them, furnish a fund of unique illustrations. Having touched at Malta and Gibraltar, they landed at Falmouth, and under the circumstances mentioned in our review of Mr. Fraser’s work, arrived in London, and were at once comfortably and sumptuously lodged at Mivart’s excellent hotel. We shall take them up on their journey from the coast, *via* Bath, and begin with their account of our *Royal Mails and stage coaches*:—

“The post in this country consists of two establishments. One is the royal mail, which is simply for carrying letters throughout the empire. Without interruption, it must go to and from London every day, to every city in the kingdom. The other consists of private coaches belonging to companies, who have in every place horses for changing, and agents or partners in every direction for arranging the business of travelling. They give some duty to government for being allowed to carry on their business, but they receive from their employment a very considerable amount of interest. *There are throughout England, Scotland, and Ireland, about two millions of coaches for this purpose, which afford the government an extraordinary income.* They run twelve miles an hour, and then change horses. One of the twelve vizirs of England is the director of this business, who is called the postmaster-general.”

At Bath, their hotel was surrounded by, and their privacy invaded by, the more curious and impertinent. Of this we have a description, of which the following will afford a notion:—

“Thursday the 10th, crowds of people of this place, about ten thousand men and wo-

men, came below our house, to look at us through the windows, where we were standing behind the glass. They continued to do this from morning till night. We, in order to satisfy their curiosity and get rid of their gazing, ordered our Persian servants to go out of doors, that they might see them. As soon as the servants went out, they were surrounded by vast crowds, about 20,000, and all the streets were full. At last the servants could bear it no longer, and were obliged to re-enter the house.”

The expedient having failed, these warm-blooded and amorous Asiatics seem to have been in some measure compensated by the *frank* and *free* visits of the *Bath ladies*:—

“Friday the 11th, in the same manner, the people came, as usual, below the windows to gaze at us. This day we were much annoyed by it; and were obliged to leave the windows and conceal our caps. On hearing a noise, as if there were many people below, we then went to the windows to look. The fact is, that the proverb was verified, ‘Like as the thirsty desire the cool waters, so the waters try to force their way.’ They were gazing at us, and we were delighted to behold their beauty; they shewed us much respect, by bowing their heads. While we were sitting, when it was about the asser, behold! a sun appeared from our east, shining and flashing. On seeing this incomparable beauty, and beholding this lovely face, like the full moon, I lost my senses, not to say that I lost my sight, in admiration. No, my eyes, by beholding her smiling, became a hundred times more powerful. The delightful odour of her hair fell into my heart, and I was obliged to rise up and invite her to sit by my side, paying her all honourable respect. My heart died away; and unless my mind had gained strength to maintain conversation with this visitor, I should have appeared as if I were lost. I asked who she was. This full moon was the daughter of a captain in the East Indies.”

The *Opera House*, in London, filled them with astonishment:—

“It is a very lofty edifice, built in a wonderful manner. From the roof of it to the ground, on the three sides round, there are small rooms made of wood, these they call boxes: these rooms, or boxes, are elegantly dressed up with woollen cloth and velvets; before every box there are forty chandeliers of cut glass; each has fifty lights; there are also lights in every part of this house. The forty chandeliers of cut glass, each containing forty lights, and each light of five branches, as well as the other lights, have one pipe, which, by touching an instrument, all the thousands of lights suddenly become dim, so that you scarcely see any thing; and, by moving the instrument differently, they as suddenly give a powerful light. There are young ladies with faces like the full moon, the beauty of whom makes the illumination of the sun dark; and a company of young men, whose beauty obscures the sun. Seats are provided below for the musicians; they play with instruments which nourish the heart: the pen and the tongue are incapable of giving an adequate description of them. The proprietor, who keeps this establishment, advertises in the newspaper, that such a play is to take place on such a night; he also prints cards, or tickets of prices, which are bought. Those who wish to go to this place purchase a card, and off he goes to the Opera; according to the money he gave he takes a seat, that is to say, there are dear and cheap places, *yet the cheapest is*

about one tomán of ours. There were in the boxes around more than a thousand young and beautiful ladies, splendidly dressed with jewels; the beam of their beautiful faces illumines the place, the brilliancy of their sweet faces takes away the heart; my whole soul cried out to leave the body, that it might go near those hours. The heart beats with the ravishment of that sight. *There are also distinguished places about this house, where are fine-looking women, with arms like jasmine, and faces like a shining mirror; these handsome young women sell refreshments; and, on the whole, this place seems to furnish the nourishment of life.* Hand is taken by hand, all sit down, conversation takes place, joy and pleasure seem to go to the extreme; indeed I have no power to describe it; let those who desire to know more endeavour to find their way to this place, where they will receive all the pleasures of life. Hour after hour I observed new things; and, while I was looking around, behold a curtain, with different figures, was lifted up, which was about ten draas long, and of the same width."

The account of the ballet and chorus-singers is quite as good as that of the fruit-sellers, &c., in the saloons; but we have not room for more than a single passage:—

"A company of fine young women and men came out, beautifully clad, arm in arm. All of them came out singing. After standing in this place awhile, they began to dance: their sweet voices went to some distance; and in this manner they continued about half an hour, delighting their guests."

The *Zoological Gardens* furnish another treat, and we must acknowledge that our princes saw much more there than we ever witnessed.

"There is also one of the wonderful amphibious animals of a curious form. It is as large as a horse. It was brought from the interior of Africa. It is a very beautiful creature. When it stands and walks, it very much resembles mankind. All kinds of baboons, of wonderful sizes and forms; they act like human beings. Bears, white, red, green, yellow, and indeed of all colours. Also a kind of monkey, which is of all the animals most like the human figure, the size of a mule, with an extraordinary long tail. These monkeys act like human beings, and laugh wonderfully, and play at chess with men, and some of those that visit the gardens play with them. To-day a Jew happened to be at this place, and went to play a game with the monkey. The monkey beat, and began to laugh loudly, all the people standing round him. The Jew felt exceedingly ashamed, and was obliged to leave immediately. The most wonderful animals of all were a pair of creatures larger than an elephant, and higher than a camel; their necks are *fourteen feet long*, their legs are handsome, their tails are like that of an Arab horse of red colour, and with white spots on the face. They were brought from Africa, and their flesh is said to be excellent. They go as fast as a gazelle. All the world, from England, Scotland, and Ireland, come to see them."

"There are also more than thirty thousand kinds of birds; in truth, we do not know how even to write their names; to describe their colours is impossible. *Some elephant birds, just like an elephant, but without a proboscis. Their wings are about fifteen yards long.* There are some others, which were brought from Abyssinia, of an extraordinary form. There are in the garden about forty kinds of peacocks, white like the snow, with beaks like rubies, and eyes like emeralds; such peacocks we never saw

before. There are also twenty-five sorts of nightingales, and parrots, and goldfinches, and fifty kinds of fowls; cocks from all parts of the world: their beautiful colours cannot be described."

"Verily a visit to a place like this brings to the mind the power of the Omnipotent. The eyes are dazzled, the mind is surprised, the heart is agitated, and curiosity takes its utmost fill. *All this gives a most excellent opportunity to the lover, to lead his favourite by the hand to shew her this and that curiosity. Besides all the above, you will see beautiful moonlike ladies, led by the hand, to gaze at these wonderful spectacles, and repose under the delightful shade of the beautiful trees.* In truth, unless the eye should see, the mind cannot form an idea of this place."

The *Colosseum* filled them, if possible, with greater surprise and delight. Never had Parris's unrivalled picture of London a higher compliment paid to it than by these princes taking it for a reality. Their ascent by the movable room, however, must first be given:—

"Afterwards we were guided up-stairs into a lofty place, where we were shewn a room, and we were asked to sit down on the chairs in it; there were also some ladies and gentlemen seated on chairs by our side. As soon as we sat down, suddenly the room* left its place, ascending up quite like an eagle, with large wings, into the atmosphere. *After an hour's time*, this bird folded its wings and stopped in the sky, then fortunately it opened its beak,† and we went out. We came out of this room on a terrace, where there were a great number of men and women standing. This place affords a most beautiful view of the city of London, with the river Thames, and all England up to the sea; in the same manner are to be seen all the edifices, gardens, and the crowds of people in the street in all quarters; and a great noise is heard of carriages, coaches, and horses. In the river Thames we observed innumerable vessels like forests, many of which were at anchor, others under sail, and a great number of steamers going and coming at great rapidity. Many persons were going to church, others were taking walks, and some on horseback about the beautiful gardens. We had a spy-glass, which enabled us to see places at a great distance; such a command of a view surprises the mind. After I had a full view of the country, I said to Mr. Fraser that, although this is a very excellent view of London and the country, yet I should like more to see and visit some of the English arts, and asked him to take us to such places, because what we see here we see every day. Mr. Fraser laughed at our question, and said, 'Is any art better than what you are actually now seeing?' What an art is it? we said: does any one doubt the power of the Creator, by whose order this world was created with its natural beauty? Then Mr. Fraser said, 'This heaven that you see is not more than four yards distant from you; if you thrown an orange against it, it will return back to you; and that which you behold with your spy-glass is not more than ten pikes from you. The city and habitations, with the crowds of people in every direction, are about this terrace, and they are not more than six yards in each direction.' It was angry with him at his saying this, it seemed as if he were playing with us. I said, 'O man, have we not eyes to distinguish between the real and artificial?' Mr. Fraser replied, 'It would be

impossible for you to know how this is done, unless you saw it.' Then he conducted us by some steps up where we saw the same spectacle, with this difference, the former was cloudy, and in this place the sun was shining. This increased our disbelief; however, we went up and down until we were satisfied. All this miracle was simply produced by a picture, which causes all this wonder and astonishment. *The air here is so shut out by the painting, as to make a philosophical illusion;* in short, it is impossible to describe this wonderful picture; and we could not believe it until it was proved to us by examining the mystery which produces all these artificial realities."

We have put passages into Italics to save ourselves the room and trouble which comments would take, leaving it to our readers to notice the singular exaggerations, whenever numbers, or time, or other quality which excited wonder in the Persians, were presented to them. But we must not, therefore, fail to observe the sagacity and penetration of many of their remarks. It is only the style of Persia, flowery beyond European measure, and not the sense that is perverted. Thus we find of

King's College.—"It is a very large, lofty edifice, of numerous apartments, enough to accommodate 10,000 scholars; there have already been in it that number of students, endeavouring to obtain the wonderful sciences. Each class has a different department; one day in the year all the students meet in a large, lofty room. On this day many of the nobility and gentry come to this assembly. Then the students of different classes present themselves, and every one stands before his professor, in the presence of the college agent, and gives a proof of his progress in his studies. Many questions are put to him on different points, which he ought to answer, to shew his qualifications; which, if great, would be also an honour to his teacher. When he satisfies the examiner, a prize of twenty tománs immediately is presented to him; generally, a handsome book with gold binding. As soon as he receives his prize, he is applauded by perhaps 40,000 persons, who may be present; it is done by clapping of hands."

As our preceding examples have afforded some idea of the love and amaze produced on the Persians by the easy and general intercourse between the sexes, we may as well put together two or three more of their raptures about our fair:—

Ladies.—"The people of this kingdom are of genteel nature, and delicate constitution; most of the ladies, and females in general, are more delicate and refined than the blossom of roses. Their waist is more slender than a finger-ring; their form is beautiful; their voice gains the affections."

Taymoor's falling desperately in love was related by Mr. Fraser; and though it is exceedingly naïve and characteristic, in the writer's version, we shall pass it over, except the conclusion:—

"Our friends seeing that Taymoor Meerza's enjoyment in their parties depended solely upon the presence of this young and honourable lady, made a point of inviting her to meet him. On one occasion we were invited to an evening party; when we arrived, Taymoor Meerza saw the house dark, not observing a ray of the shadow of his love: he looked in every direction, and did not see the star appearing from the horizon. The more he looked round, the less he saw. Then he said to himself, 'Oh! how have I lost the sight of my eyes! let me die.' Again he said? 'Nay,

* "The Colosseum."

† "The door."

‡ Here Reesa Koolos Meerza seems to speak."

what will it profit me if I lose my life? Oh! let me live, if I can only see her again. Can I be in a party without my soul? No! It is impossible, let it not be." Then his heart forced him to rise up to the host; with an open eye he asked him, "Where is the lady?" The assemblage suddenly laughed, saying to him, "She is already out of your grasp." Two days ago she fell in love with a young gentleman with whom she went to the great church, and was married with him; and both of them have left the city. They are now walking about among the flowers, enjoying the pleasure of love. Unfortunately, Taymoor Meerza, as soon as he had heard this unexpected news, was almost distracted, and could scarcely be comforted by any body. However, our friends explained to him that she did not keep her word; and that he need not be sorry; and, with much pains, they restored his heart."

Of an entertainment given by the Duke of Buccleuch, we hear:—

"Monday the 21st, about the asser, we went to the house of a very great nobleman, the Duke of Buccleuch, who is also richer than any other of the nobility of this kingdom. Majestic splendour and imperial greatness appeared at his house. Many princes, vizirs, and nobles, were present at this assembly; also many handsome ladies, sunk in jewels and precious stones, the beauty of whom made the sun that illuminates the world look ashamed of itself. His house is situated on the river Thames, where many of the young nobility and great personages were in their boats, betting with each other about their best sailing. The band of musicians were also standing by. The one who beats, receives the high tune of praise from the musicians; and the beautiful ladies clap their hands, burning the hearts of their admirers. In several directions of the garden were tables furnished with all sorts of sweets and refreshments, for the pleasure of the visitors. More than 200,000 tomans on this day changed owners."

We have never met with so happy a satire upon the custom of *duelling*, as in the Persian's most unintentionally humorous description of our proceedings on such occasions:—

"The men are very particular in their disputes, which are carried on with great ability. If there should be the widest possible misunderstanding, still they keep up the rules of politeness. If it should rise so high as to produce vindictive feeling, still they carry on their disputes in a genteel style, and bad language (God forbid!) is not used. To be called a liar is the utmost insult: this will lead to a duel; the duel is allowed here. Sometimes this happens in such circumstances as the following:—If a man should be at an assembly, and should have something said to him improper or disgraceful, he who feels it to be such would at once leave the room. Then he will relate it to some friend, saying, that he heard so and so, at such a place, in such a party, which he did not like at all. Then his friend will reply, 'So and so, perhaps, did not intend to insult you; he might have said it by accident; write a note, and I will carry it to him, and learn more fully.' Then the plaintiff will write to him a respectful letter as follows: 'At such and such a day, at such an assemblage, I heard you say such words which made my heart feel angry; please to explain to me what you meant.' Then the friend will carry the note, and request an answer. If the object of the accused is not to insult him, he will write him an answer as follows: 'Upon my honour I never intended to create any displeasure in you, and

should I have said any thing which you consider improper, I now beg your pardon.' Such an answer will settle the question. But if otherwise, he will neither excuse himself nor beg pardon, but will answer as follows: 'I have received your letter, which I will thus answer; Meet me on such a day, at such a place, and thereby you will be informed, and learn all the particulars.' This will give him to understand that the object is a duel. Then he informs his friends of it, and commences preparations to meet his opponent; and likewise the other will inform his friends, that he has already appointed the time to fight with such a man. Then the friends of both endeavour to settle the question between them; but generally, this cannot be effected without fighting the duel. However, when all mediations fail, then the two individuals, accompanied by their respective friends as witnesses, meet at the appointed place, exactly at the fixed hour, which will be published in the newspapers. When the two come to this place with their pistols, then the friends use their utmost influence of mediation; if at last all should be in vain, then they separate from each other a distance of twenty feet, and the signal will be given when both fire. Then it becomes a matter of chance; sometimes both of them are hit and perish, and perhaps no one is hit, or one dies, and the other is saved. Thus the question is finished; this act is permitted by their law, which does not condemn it, and it has been a well-known practice among the fools of this nation from the ancient times. It is quite similar to the old foolish custom of the heathens, who threw both the plaintiff and defendant into the fire, believing that the flame would only burn the criminal and not the innocent. Thus, also, these people believe that the bullet will not hit the innocent, and this old foolish custom is continued among the imprudent class of the Franks."

The names assigned to our ministers are funny enough. Besides those already quoted, Lord Melbourne is the Vizir Azam (or Prime Minister), Lord Glenelg (no longer), the Vizir of the New World, Sir John Hobbouse, the Vizir of the East Indies, and so on; and it is curious enough, we are informed that America is known in the Turkish language by the name of *Yanki Dooniah* (or the New World), and as near *Yankee Doodle* as we could have expected! We will now string together some observations on many sights, which require no comments from us:—

Balloons.—"On our way to this mansion we observed some domes (balloons) flying to heaven, and men in them; this is as great a miracle as any."

Our Navy.—"The ships on this river (Thames) are like forests. The large men-of-war are 1200 in number, some of which are of 120 guns; these, besides the packets and steamers. The least of their navy carries thirty guns. The British mercantile vessels are above 25,000, such is their extreme and extensive commerce. Indeed, the English power on the sea is so great, even that the present sovereign, during the reign of his brother, was the lord high-admiral, and he spent a very long time of his life on the seas. In fine, all the ships of other nations on the globe could not equal the number of the English ships alone, nor ten foreign men-of-war stand in battle against one English; they have always been victorious over their enemies." * * Besides the above-mentioned ships, they have innumerable others in the West and East Indies, in America, and Australia, which are called out at the time of necessity. The water of the

river Thames is very heavy, and not at all good for the digestion, nor could it ever produce an appetite. Yet the people of this country do not use water as a drink; when it is necessary they take a little, once in three or four days." (What will the temperance societies say to this?)

London Doors.—"Their doors are beautifully worked, and many have gold knockers of a hundred tomans' value."

London Clocks.—"When a person has an engagement or an appointment at such an hour, either on business, a dinner-party, or whatever it may be, the person always puts into his mind the fear of not being in time; therefore, he is always on the alert to be at the exact moment. For this purpose they have, on the outsides of all their churches, at the four sides, fine clocks, which strike every hour, exact to a second, and the striking of the clocks may be heard four miles distant. The clocks that are thus fixed on the walls of the churches and other edifices in London, may be more than 500,000!!"

National History and Politics.—"In former times, the Franks, especially those of England, were like animals and quadrupeds, and had no arts of any description. They dwelt in forests, mountains, and the extreme coasts of the sea, dressed in skins of animals, and eating the natural productions of the earth, and if they had a king, they sometimes killed him; and likewise their kings killed many of the people. These oppressions, outrages, and violations, caused always quarrels between the kings and their subjects. Many people, during the height of oppression, had no rest, and were obliged to abandon the country, and go to the New World and other parts."

Now "all know the law, and what is justice: they obey their laws, which are founded on liberty. Every person enjoys this liberty, and acts according to its laws. Vizirs, princes, even the king himself, has no power to kill a bird. For instance, should the king fire at a bird during the prohibited season, he must stand before the law, and receive the decision thereof; in short, every person is under the law." *

Charities.—"In charity, and supporting the poor and orphans, they are exceedingly liberal; so much so, that they give ten per cent per annum of their income to institutions of charity. On account of the dear prices of living, there may be, out of the 27,000,000 of population, 7,000,000 poor; but not a single person begs in the streets, nor in any part of the kingdom: in fact, if there should be any one begging, he would be taken up immediately and punished for it, as it is against the law; because, in every quarter, there is a house built on purpose for charity, where the poor are accommodated. An agent is appointed for it, who receives the revenue from the good men, and spends it on clothing and maintaining the poor comfortably."—[See "The Times" newspaper, *passim*!]

But our author, after noticing the hospitals, says:—

"All these institutions have taken their rise within a period of two hundred and ninety years. Before that time the people were wild beings, and now they cultivate all branches of science; so much so, that their children are scientifically educated, and speak twenty languages. They do not spend one moment in vain. Great and small, old and young, every

* The princes wondered much as they travelled to town that they were requested not to amuse themselves by shooting deer, &c., which they saw in parks as they drove along.

one is endeavouring to enlarge his interest. Perhaps, out of this 27,000,000 of population, there is not a single soul who does not know how to read and write; not even the dumb, deaf, or blind. They do not give credit for fine handwriting; they say, writing is good enough if it can be read, and they do not spend the time simply in learning a beautiful hand. They have several thousand colleges and schools, for instructing in every class of learning, on which they have spent millions of money. All this for education and wisdom. Verily, such a magnificent kingdom and high nation is not, in these times, in any other part of the world, nor has such an one been, even in ancient times, mentioned in the histories."

Ingenuity!—"Their carts and carriages strike the observer very much. A large tree, which would require 600 men to carry it, may easily be transported to any distance on a cart drawn by two or four horses. They have also instructed their large dogs even to draw carriages quickly. They are fond of dogs, and take pains to teach them to become useful; they make them so serviceable that sometimes they are sent on business. For instance, if a man wants something from a shop that is known to his dog, he will write a note to the shopkeeper, asking for what he may want; then he puts the note into a basket, and hangs it on the dog's neck, and gives him a sign. The dog will carry the message immediately, and return to the satisfaction of his master. Many other curious things are done by their dogs, not important to be mentioned. They do not keep any useless animal; all that they keep must be of use. If any should be of no use, they will dismiss them."

We fear the *ex uno disce omnes* has been unguardedly the rule in this dog-story. It is thus that travellers are occasionally led wrong. They generalise from a single fact.

Finance, and the way in which the Chancellor of the Exchequer is treated.—"The vizirs must present every year a correct account to the House of Commons, even to a penny, with satisfactory explanation how and for what these errors have been spent. If the expenses that were made should be agreeable to the Commons, well and good; if not, the vizirs must stand the consequence, and will be obliged to prepare more satisfactory proofs in the next session; and, on the whole, it is impossible that a halfpenny should be spent without utility. The Treasury has a vizir on purpose, whose duty is to receive in, and to present, the accounts at the proper time. These accounts must also be regularly published in the newspapers, that every soul in the empire may know how the money was spent, and every person that has given ten tomans of the revenue, in case he should see any thing wrong in its expense, has a right to rise up in the House of Commons, and seize the vizir by the collar, saying, 'What have you done with my money?'"

Whigs and Tories.—"The administration consists of two parties. The one is named Whig, and the other Tory. The difference between these two parties is political, that is, every one has a different opinion on policy. Their seats in the vazaraship, or administration, depend on the House of Commons; that is, if the majority of the House are Tories, then the ministers also are Tories; and if they be Whigs, then the ministers are Whigs. They cannot both be in office at the same time. Administration must be of one party alone. It happens sometimes that they are changed; one goes out, and the other comes in. Sometimes

the father is a Whig, and his son a Tory; and two brothers may also be one a Tory, and the other a Whig. The difference between these two parties is as follows:—"The Tories in ancient days have always been in office, and thereby they have established to themselves some privileges by which every one is now a possessor of millions of money."

The Royal Family and Nobility.—"All the people in this kingdom are clad alike, and there is no distinction of dress. Vizirs, nobles, and other great personages, go out about the streets alone, and sometimes purchase what they may fancy; even members of the royal family do so; and sometimes the king in person goes out, dressed like other people: when he does so nobody pays him the honour due to him as king. He is only respected as such when he goes out in his state. The kings here can only marry a member from the same royal family, and not from any foreign; as it is considered unlawful, because he is the father of his subjects. Likewise a royal princess is never married to any person but to a royal prince, and this rule is kept by all the sovereigns of the Franks."

Astronomy.—"An inspection of Sir James South's observatory excited great wonder, and the summing up states our knowledge in astronomy:—

"In fine, they have arrived at these conclusions from their accurate observations. They have also ascertained that each of the planets is, like the terrestrial globe, inhabited, and that besides the known seven planets, there are four others, and that the earth itself is a planet, and turns upon its axis like the others. As to the sun, they believe it to be fixed, and that the seven planets are perpetually revolving around it in their orbits; they approach and recede from each other."

And here, with this fortunate relief from the gravity of science, which at present overwhelms our columns, we must stop; but not without promising our readers that they shall next week have a continuation of the treat, and some no less amusing matters.

LITERARY AND LEARNED.

THE BRITISH EMPIRE IN THE EAST.

By COUNT BJORNSTJERNA, the Swedish Ambassador.
[Continued from Page 537.]

To the west of the Oxus, between that river and Persia, we find the nomadian tribes of Turkomans and Kurds, who are certainly capable of making depredations on the dominions of their neighbours, but cannot undertake any campaign against so distant a country as India. Their forces consist of numerous undisciplined cavalry.

At the mouth of the Oxus, on the shores of the sea of Aral, lies the Khaunt Khiva (called also Orgunje*), a fertile base, surrounded by sand and salt deserts: the whole of its military force consists of 10,000 cavalry, which, if even joined to the Turkoman tribes, on whom the khan in Khiva exercises great influence, would nevertheless be unable to effect any thing against India. The short sketch here given of the central countries of Asia will, although very hastily made, be sufficient to shew that neither of them is capable of alone undertaking any thing against British India; and a union among them is not probable, as both political and religious antipathies would prevent it. It is, consequently, not from them that India has any thing to fear; it is to

* Murawief, who, in the year 1820, was sent on a political commission to the khan in Khiva, has published a work, which contains the best information respecting this country.

the north of these countries that the power is to be sought, which alone could venture upon an undertaking against India. This power, Russia, is, consequently, that to which we must now direct our attention.

The powerful prince who now so vigorously guides the helm in the above-named empire, has, during the few years he has filled his exalted station, gone through a whole series of political storms, all of which he has happily overcome.

After having first, within his own country, suffocated the hydra of revolt, he engaged in the Persian war, which ended with the planting of the Russian eagle on the shores of Araxes, and on the pinnacles of Arrarat. The Turkish war following shortly after, finished in Adrianople, on the other side of the Balkan, hitherto considered impassable, and completed the power of Russia over the Black Sea, and the mouths of the river Danube. The Polish war finished in Warsaw, and advanced the Russian boundary to the Oder in the very heart of Europe. The Egyptian-Turkish war ended with opening the ports of the Bosphorus and the Dardanelles to the Russian ships-of-war, while they were closed to all others; yes, even the most friendly relations have in the north advanced, if not the boundary of Russia, at least its fortified, and therefore more threatening base of operation. All this has been accomplished in little more than a decennium, and has raised the Russian empire's political influence to that degree, that what was before impossible, even an undertaking against India, has now come within the range of possibility.

It is from this new point of view that the position of Central Asia must now be considered.

The conquest of India has long been a general subject of conversation, and a fervent desire for this has been expressed among the nations of Central Asia, as also among their northern neighbours, whose territories extend from Lapland to China. This wish, founded on the memory of former successful conquests, will probably (how promising so ever it may appear to the people) not be entertained by their leaders and statesmen without great consideration; they certainly see the difference between the past and present, as also the many local and political hinderances which would meet such an undertaking.*

Those armies which formerly conquered India,—Mahmud's (of Ghizni), Tamerlane's and Nadir Shah's, were composed of only light cavalry, and therefore free from all that baggage which usually accompanies a European army; though this, especially as regards artillery and ammunition, is now absolutely necessary, in order to be able afterwards to compete with a force, also organised in the European manner, on the borders of India. These armies of light cavalry which were enabled to surmount those mountains, and to go through those deserts which are every where met with on the way to India, could equally well, on their arrival, be compared with the army that was collected there, and yet

* Many plans for the conquest of India have been formed: Potemkin and the Prince of Nassau, Siggen, (the same that commanded the Russian fleet at Svoulskund) formed more than one for Catherine. The Emperor Paul also entertained such a plan; but they were partly formed without the necessary knowledge, and partly under circumstances so very different from the present, that they are now no longer of any service. General Gardanne, Napoleon's ambassador at the Persian court, also made a plan, which is said to have fallen into the hands of the Russian army during the campaign of 1812, but neither would that answer the existing state of Asia.

The very skilful and equally active generals of the Russian army (especially General Yermolov and Field-marshal Paschkevitch) know the central lands of Asia, and the roads to India, better than any of their predecessors, and have in this respect nothing to learn.

was composed only of irregular troops. The case is now quite the contrary; India is defended by an army organised in the European way, well disciplined, and supplied with an excellent artillery, which cannot be attacked with the slightest hope of success by any other force than one formed in the same way. The question is, therefore, Whether *such a force* can possibly press forward through the extensive sand deserts, and over the cloud-capped mountains which separate India from Central Asia?

It is the examination of this question we should now briefly undertake.

As the Indus, which covers the north-west boundary of Hindustan, has a course of nearly 200 geographical miles from the Himalaya mountains to its mouth, there are only three ways by which an army, organised in the European manner, can advance from Central Asia to the above-named boundary river.

These ways are:—

1st. That which leads from the provinces Fars* and Kerman, along the eastern coast of the Persian Gulf, through Beluchistan to Sind, at the mouth of the Indus;

2d. The great road which goes through Musched, Jeerbuk, Herat, Kandahar, Ghisna, Cabul, and Peschawer, to Attock, near the Indus; and,

3d. That way which, following the Oxus, goes to Koondoo, and thence over to Hindoo-Koosch to Cabul, &c.

Between the last-mentioned of these roads and the central (over Herat and Kandahar), goes a chain of mountains, Hindoo-Koosch, always covered with ice, over which there are no roads, and where it is impossible for an army to proceed.

Between the above-named central road and that which follows the Persian Gulf, lies the Kermanian sand desert, which extends more than 100 geographical miles from east to west, and more than 150 from north to south; where no other water is to be found than a few wells, scarcely sufficient for one caravan; where no food can be obtained, and where sand ridges, of more than thirty feet in depth, form invincible barriers to an army organised in the European way. Nearer the Indus, the Soliman mountains also form an obstacle on this road, the rocky passes of which, surrounded by precipices and crossed by rivers, are at certain seasons quite impassable, and the rest are so easily defended, that a handful of soldiers there can prevent the progress of a whole army.†

As to the first of these roads (that along the Persian Gulf), there is only one example on record of an army having followed it,—that of Alexander the Great. After his unfortunate march to India, and having gone along the Indus to its mouth, he turned off at Patula, the present Tattah, and marched through Gedrosia (now Mukram, a part of Beluchistan) to his conquests at the Euphrates. His historians mention the devastation caused in his army by famine and thirst.‡

Alexander was, however, master in the Persian Gulf, and was accompanied on the left flank by his fleet under the command of Nearchus, conveying water and other necessities of life. This assistance could not be obtained by an army now marching the same way to India (the English being, by means of their squadron stationed at Bombay, sole mas-

ters of the Persian Gulf); and without such help, an advance there would be quite impossible. We see thus that India is perfectly safe on this side.

Let us now examine the northernmost of the three ways which lead from the central countries of Asia to India, namely, that which, following the Oxus,* goes to Koondoo, and thence over Hindoo-Koosch, to Cabul, and further to the Indus. It is by this way that General Evans,† in his work entitled "Designs of Russia," considers a Russian army might most easily press forward to India; a more particular examination of it will shew the real state of the case.

The army intended for an expedition against India on this side of the Caspian Sea, should be collected in the government of Orenburg, which already presents considerable difficulties, on account of the scarcity of food in this badly cultivated and mountainous province. Three roads lead thence to Central Asia.

One goes from Orenburg, between the sea Aral and the Caspian Sea, to Orgunje (Khiva), and further to Bokhara; it is a journey of sixty days for a caravan, and would consequently take at least the same number of days for the march of an army. The second goes from Troitskoi in Asiatic Russia, through Dutsht-i-Kipchak, or the desert of Kipchak, east of the sea of Aral, to Bokhara; a caravan takes forty-eight days to travel this. The third road begins at Kuzuljar, or, as it is also called, Petiopolak, near the river Issin, and leads to Bokhara, in a south-west direction, going through Taahkiud; this road requires a journey of ninety days for a caravan.

All these roads lead through those salt and sand deserts which separate Russia from Khiva and Bokhara. The great distance, together with the general want of water, sufficiently shew the impossibility of proceeding there with any considerable army.

Two scientific men,‡ accompanying the mission of the counsellor of state, Neyri, to Bokhara, have, in their accounts of the journey, shewn the state of things; and mentioned that several hundred camels were necessary for carrying through the desert the water and food for the embassy, consisting of 100 persons. By means of a fleet in the Caspian Sea, an army might be able to go round these deserts; but for this it would be necessary that it sailed to the mouth of the river Attrack, by which means the line of operation would be altered, from that proposed along the Oxus, and in such a case go over Asterrabad, Musched, Herat, and so on. Besides, Russia has only eight or ten small corvettes in the Caspian Sea, and the whole of its trading fleet there consists of, at most, thirty or forty open vessels; there could, therefore, be no possibility of transporting even the most trifling body of troops.§

According to the latest examinations of the river Oxus (by Alexander Burnes, 1833), it is navigable throughout the greater part of its course, and is free from sandbanks, cataracts, rocks, and whirlpools. If it did not, at its mouth in the Aral Sea, become a morass, it would be navigable for the course of 120 geographical miles (taking away this marshy part, it is navigable for a distance of 100 geo-

* The Asiatic tribes now call the river Amox.

† General in the Spanish service; colonel in the English.

‡ Meyendorf and Everman.

§ A transport fleet might possibly be built at Kasan and Astrakhan, where there is much timber; but this is a great and expensive business, which requires several years preparation and labour, and consequently need not be taken into consideration before it is absolutely built. Seamen, to man this fleet, would also be needed.

graphical miles, fifteen miles on the degree of latitude). At the narrowest part it is 500 yards; its depth during the driest season is nine feet, at other times, even thirty. A considerable number of vessels are to be had, each of which holds 200 men; and as the shores are thickly inhabited and rich in timber, there are the means to build more. An army, following the Oxus, can thus with tolerable ease press forward on it as far as to the neighbourhood of Balkh, where an extensive mountainous tract presents itself, which forms a branch of Hindoo-Koosch (the Indian Caucasus), and the breadth of which, from Balkh to Cabul, is more than sixty geographical miles. The height of the passes above the surface of the sea is from 8 to 12,000 feet; and these not free from ice and snow for more than July, August, and September, and even then are exposed to lavines, which often bury whole caravans. This mountainous tract consequently presents, if not insuperable, at least very considerable, hindrances to the progress of an army.

It is about forty-five geographical miles from Cabul to the Indus; the first thirty go through a thinly inhabited and rocky country to the town of Peschawer. The pass, Khyber, through which this road goes, is five miles long, presents every possible natural hindrance, and is the haunt of the bold Khyber's robber-bands. Peschawer is a very flourishing and populous town, situated in a fertile country, whose well-cultivated fields are watered by dams on the Cabul. Hence two ways go to the Indus. The first to Attock (fifteen geographical miles from Peschawer); the other towards the south, over salt hills, which form the usual difficulties in mountainous tracts. This road afterwards follows the right shore of the Indus, crosses it at Kuhera, and thence to Multan: here it divides itself into two branches, one of which follows the river to Sinda, while the other goes through the Bikanerian sand-deserts to Agineere, and so on to British India.

The road from Peschawer to Attock is passable even for artillery, but goes through a narrow pass, formed by the river Cabul on the one side, and a high range of mountains on the other, where a small body of forces can prevent the approach of a whole army. Such passes are also met with on the road leading over the salt hills to the river Indus.

We have now shewn the natural hindrances to the advance of an army along the Oxus,* and over Hindoo-Koosch to India; besides these, however, there are the political hindrances, which are of more consequence than the former, for such a military expedition presupposes that all the states on the way should first be taken by force (voluntarily they will never unite with Russia, which is considered, as well by the inhabitants of Khiva as Bokhara, as a hereditary enemy), which makes an operation along the Oxus any thing but easy. It would require at least one campaign to force Khiva, one for Bokhara and the Turkomanian tribes, and one for Khoondoo. It would, consequently, not be before the fourth campaign, that a Russian army would be able to go over Hindoo-Koosch to Cabul, &c.; consequently India seems as safe on this side from attack as on the southern road, along the Persian Gulf. It now remains to examine the

* Shiraz is the principal town in the province of Fars. † Colonel Pottinger's and General Sir John Macdonald's opinions, given to the East India Company, testify this.

‡ It was in the desert Mukram that Alexander quenched the thirst of his army by throwing away the water which a soldier offered him in his helmet.

* Nadir Shah, on his return from India, transported his army on the river Oxus, which was so much the more easy, as he went down the river: it would be quite another thing for an army which, coming from the north, should go up the same, the river being very rapid, and consequently requiring that every vessel should be towed either by man or horse.

particulars of the third; namely, the central road leading to India over Persia and Afghanistan.

The form of the country of Persia is particularly that of a table-land rising gradually, which, at the foot of that chain of mountains which crosses its northern parts, raises itself 5000 feet above the surface of the sea;* its soil is a mixture of salt and sand, dry and barren, without streams, and wanting generally a supply of water; within this half wilderness there are certainly some beautiful oases, abounding in all kinds of vegetation where towns have been founded, but between these an army cannot find a single thing necessary on its march.

The road generally taken from the Interior of Persia to Afghanistan keeps from Teheran the above-named chain of mountains, and goes over Astrabad and Mueched to the strongly fortified Herat, in Khorassan, near the borders of Afghanistan (the distance from Teheran to Herat is 200 fursukhs—130 geographical miles).

This road presents no insurmountable hindrances for the march of an army, though the above-named difficulties of obtaining support are every where met with, which necessarily oblige it to separate into small bodies, to enable it to obtain the necessities of life.

From Herat, two roads lead to India; the one goes directly to Cabul and forward to India (fifty geographical miles), but through wild and rocky tracts and passes, defended by such insuperable mountain castles, that one can reach them only by means of ropes, consequently impracticable for an army. In order to avoid these passes, an army must march from Herat to Kandahar, this road is passable even for artillery: the distance is from one town to the other 100 fursukhs (65 geographical miles).

From Kandahar, two roads lead through Sevestan to India, one meets the Indus at Mittun, the other at Schikarpur. From Kandahar to Mittun the distance is 85 geographical miles; from Kandahar to Schikarpur, 100. Both roads go first over a sand desert, which, on the former, extends 20 miles, and, on the latter, more than 40. Here the Soliman mountains present themselves, the inaccessible passes of which have been described above: on the other side of these is another sand desert. At Mittun the Indus has (according to Alexander Burnes) a breadth of not less than 2000 yards, and is besides, very rapid; so that the passage, in sight of an army posted on the other side, and without the heavy artillery which is necessary to reach and clear the opposite shore, would be very difficult, if not impossible, and the retreat exposed to the greatest dangers. The case is the same at Schikarpur, where the river is as broad as at Mittun.

In consequence of these circumstances, the best authorities (Pottinger, Christie, and, latest, Conolly) consider neither of these roads practicable for a force organised in the European manner.

An army destined for India must, therefore, seek another road from Kandahar, different from either of the last mentioned.

This is found by turning from the place in question to the north-east, and going over Ghuzni to Cabul. The distance is 120 fursukhs (360 English miles), the road passable even for artillery, though constantly leading through defiles between lofty chains of mountains. Food may be obtained if the inhabitants are friendly. A considerable body of troops might also obtain

the necessities of life at Cabul (renowned for its thousands of gardens).

(To be continued.)

ORIGINAL POETRY.

SOLVERS.

London in the Month of September.

Now on St. Stephen's staircase turn their backs,
And with their Mantons set ablaze each moor;
From Downing Street now fly the jaded hacks,
And yawning beaux desert the chaise-horse door.
The empty Park, alas! is now a bore,
Its dull monotony no chariot breaks;
Even cits their ledgers and the 'Change forsake
For Hampstead's breezes or for Margate's shore.
I, too, when Slumber seals my wearied eyes,
'Mid visionary scenes my cares forego;
Then murmurs in my ears the streamlet wild
Where first the Muses met their wayward child;
But brief, alas! the joys that I must know,
For with the dawn the dear delusion flies.—R.B.S.

THE DRAMA.

Haymarket.—Miss Ellen Tree made her first appearance, since her return from America, at this house, on Tuesday last, in the character of *Viola*, in Shakespeare's *Twelfth Night*. Her welcome was most warm; and she is now playing, to crowded houses, alternate nights with Mr. Macready. She is much improved in appearance, and more decided in her style of acting than when she left us, but as charming as ever. During the week, she has played *Pauline* in *The Ransom*, and *Ian*, in *Sergeant Talford's* tragedy of the same name; in all of which her reception was most unequivocal; and we, in common with the play-going world, have cause to rejoice at the re-appearance of this beautiful actress. Mrs. Fitzwilliam, the popular and amusing Mrs. Fitzwilliam, is about to leave us for awhile. She takes a farewell benefit on Thursday; and who is there that does not wish her a bumper?

English Opera.—Mr. Balfe's season closed here with a benefit on Saturday, when Mrs. Balfe made her first appearance on the English stage, as *Amina*, in *La Sonnambula*. Her reception was very favourable; and we think she will prove an attractive addition to our modern musical school. She has a very sweet voice, without great power. The theatre has continued open during the week, under the management, we believe, of Mr. Ternan, who has been doing the "first business" in very creditable style. There has not been any novelty to mention.

Strand.—A complete change of performances took place at the Strand, on Monday; partly novelty, partly revival. *The Scottish Chiefs* belongs to the first; it is not Miss Porter's, "but is written by E. Stirling, Esq.," at least so say the bills: it was successful, and no more. *The First of September*, also new, is a very witty and laughable farce; it is from the pen of Mr. Oxberry, and will have a run. *Othello*, with a capital Irish *Iago*, in Mr. T. Lee, was the revival; it was as droll and as successful as ever.

Astley's.—The tournament at Astley's is likely to be a much more profitable exhibition than that in Ayrshire. It is a stirring affair, full of feats of arms, performed by belted knights, and Amazonian ladies; tilts, processions, mummeries, all shewn off with the advantage of gorgeous scenery, brilliant light, and, whatever weather it may be outside, with every appearance of sunshine within.

VARIETIES.

M. Schönbein.—The writings, experiments, and discoveries of this eminent chemist, who has contributed to the *éclat* of the meeting at Birmingham, are not so well known in England as they ought to be. On the Continent they are justly held in high respect. We observe in

the last number of the "Bibliothèque Universelle de Genève," which has reached us (No. 42, *Nouvelle Série*), a very valuable contribution of his on the chemical modifications of nitric acid, alcohol, and ether, under the double influence of the voltaic current and platinum. Nineteen interesting experiments are detailed, in which the uses of electricity in Organic Chemistry are demonstrated in a very important manner.

Growth of Wheat.—In a conversation which took place after the reading of Mr. Webb Hall's paper 'On Accelerating the Growth of Wheat,' it was stated that a hundred and fifty kinds of wheat were sometimes to be found in one field in England; and that in Spain two hundred kinds were cultivated. If not amenable to the same rule, it should seem that it would be an improvement to keep these varieties as separate and pure as possible, especially in following out the important experiments of Mr. Hall. If we can grow the same corn crop in five months which occupies the ground, at an average, eleven, see what pasturage might be gained in the meantime—pasturage as essential to the prosperity of England as even the "golden ear" itself.

New Application of Steam Power.—Mr. John McNeil, the engineer of the Clyde navigation, has constructed a rail-tramway along the banks on which a steam-engine moves, and, acting instead of horses, will, it is stated, be able to drag the vessels at the rate of eighteen miles an hour.

Tournaments.—Lord Eglintoun (a name that sounds like ancient chivalry and romance) having brought the pomp and circumstance of ancient knighthood into fashion again; we may notice, with commendation, a neat little tome on the subject, entitled "Tournaments" (pp. 90, W. Strange), which gives a concise but pleasing account of the ceremonials and effects of this warlike and feudal style of life.

LITERARY NOVELTIES.

LIST OF NEW BOOKS.

A Manual for Mechanics' Institutions. Published under the Superintendence of the Society for the Diffusion of Useful Knowledge, post 8vo. 3s.—Narrative of the Discoveries of Sir C. Bell in the Nervous System, by Alexander Shaw, 8vo. 5s.—Ireland: social, Political, and Religious, by Gustave de Beaumont, 2 vols. post 8vo. 21s.—Rowbotham's Derivative Spelling-Book, 12mo. 2s.—J. Felton on Performing Commercial Calculations, 12mo. 2s.—Thuilleur's Animaux, Part II., square, 2s. 6d.—Short Essays in Verse on Sacred Subjects, by R. Bartley, post 8vo. 3s.—The Orchard and Fruit Garden, by C. McIntosh, 12mo. 10s. 6d.—Johnson's Every Lady her own Gardener, 12mo. 2s.—The History and Antiquities of Newbury and its Environs, 8vo. 14s.—Tupper's Modern Pyramid to commemorate a Septuagint of Worthies, post 8vo. 7s. 6d.—The Visionary, Canto III., by Lady Stuart Wortley, post 8vo. 7s.—Six Years' Residence in the Australian Provinces, ending in the year 1839, by W. Mann, 12mo. 12s.—A Suit of Armour for Youth, coloured plates, 12mo. 10s. 6d.—The Evergreen, in Prose, by B. H. Draper, 32mo. 3s.—Life and Times of the Countess of Huntingdon, 3 vols. 8vo. 24s.

TO CORRESPONDENTS.

"C. A." will not do yet. A stanza in which "again" and "men," "sing" and "queen" are the rhymes, must be greatly improved before publicity can be recommended. The author of the "Dear Sister of Sidney," will find a packet at our office.
